7.0014, BACKSCATTER RAY TRACE

T.B. Barrett, Parke Mathematical Lab. Inc., *1 River Rd., Carlisle, Massachusetts* 01741 (DF902400; F19628-77-C-0054)

AF function - high frequency radar detection at long range. Deficiency - inadequate mathematical and computer techniques are available to translate ionospheric measurements into short-term predictions on the effects imposed by ionosphere on oth radar. Objective - develop computer automation for ray-tracing synthesis of backscatter-radar ionograms, and for inference of ionospheric electron distributions from observed backscatter ionograms. How research contributes -backscatter ionograms can potentially be computer processed to produce electron distributions in the region of radar surveillance, and thus can be used to update current ionospheric models. Backscatter radar observations on group-path range and apparent azimuth can be converted to ground range and true azimuth when the electron distribution is known.

The approach to this effort will be to develop computer techniques to automate the synthesis of swept-frequency backscatter ionograms, using three-dimensional ray-tracing computations for given electron distributions. Techniques will be developed for categorization, storage and retrieval of major characteristics of the synthesized ionograms. A computerized procedure will be developed for converting an observed ionogram into electron distribution by computing ionograms for trial electron distributions till the computer matches the observed ionogram.

7.0015, SOLUTION OF REYNOLD'S EQUATIONS

W.E. Simpkin, Vought Corp., *P.O. Box 5907, Dallas, Texas* 75222 (DN890155; N00019-79-C-0136)

Jet entrainment is dependent on the jet velocity profile and turbulence level which at present are not accounted for in model testing or in mathematical models of jet entrainment and mixing. The ultimate goal of this work is to develop a model that will account for all the major parameters in the mixing process, such that jet entrainment can be modelled.

8.0001, SOLUTION GROWTH OF CRYSTALS IN ZERO-GRAVITY

R.B. Lal, Alabama Agricultural & Mechanical University, School of Arts & Sciences, Dept. of Physics & Mathematics, *Normal, Alabama* 35762 (NAS8-32945)

A series of experiments will be performed in which crystals will be grown by the low-temperature solution growth technique in a microgravity environment of the orbital Spacelab. The objectives are: (1) to produce structurally more homogeneous crystals free from inclusions of solution by eliminating convection transients, (2) to obtain data on mass and heat transport in diffusion controlled growth system, and (3) to confirm the advantages of a microgravity environment for solution crystal growth. Triglycine sulfate (TGS) crystals will be grown in the Fluid Experiment System (FES) on Spacelab III by slowly extracting heat at a programmed rate through a seed crystal of TGS suspended on an insulated string in a saturated solution of TGS. Variations in the liquid density, solution concentration, and temperature around the growing crystal will be studied using a holographic technique. Growth in earth gravity will be studied by the same techniques and the resulting crystalline features will be compared and correlated with the growth conditions. In a microgravity environment it should be possible to eliminate convective flows and establish a diffusion controlled transport of the solute to the interface. By extracting heat from the crystal in a controlled manner, it should allow a slow but uniform growth resulting in a high degree of crystal perfection. Also, TGS has practical applications as infrared detectors whose performance might be improved by increased perfection. Experiments for the growth of TGS crystals are in progress. For the first time, crystals of TGS have been grown by cooling the seed crystal.

8.0002, A STUDY OF OPTIMUM INSULATION CONFIGURATIONS AND MATERIALS

F. Holmstrom, California State University & Colleges, San Jose State University, School of Science, Dept. of Physics, *Washington Sq., San Jose, California* 95192 (NCC 2-26)

The objective of this project is to find ways to passively protect equipment or structures from fires or other heating environments (e.g. by insulating the equipment from the fire), or to prevent propagation of compartmental fires to adjoining compartments. Systematic designs of fire protection systems are being done with mathematical models of fire protection and insulation systems.

The goals are: high level protection per unit weight, high durability, negligible toxic gas and smoke production, and resistance to corrosion from salt and humid atmospheres. The proposed configuration consists of numerous 'thin' insulative layers, with an air gap separating each layer. NASA has developed a mathematical model of this system containing air gaps, and a number of optimum designs have been analytically determined. NASA is also conducting an experimental fire testing program to verify the performance of these systems. This agreement will compare the mathematical and experimental findings for these types of protection systems in an effort to implement practical fire-protection systems.

8.0003, THEORY OF STRONG TURBULENCE BY RENORMALIZATION INTO REPEATED-CASCADE

C.M. Tchen, City University of New York, City College, Graduate School, *Convent Ave. & 138th St., New York, New York* 10031 (NSG 1485)

The general problem of turbulence and the particular problem of optical turbulence concern a system of stochastic and

nonlinear partial differential equations in configuration space. The difficulty as introduced by velocity can be minimized by a kinetic approach, transforming the said system to a master equation in phase space. The velocity now being an independent variable ceases to cause nonlinearity. The closure thus simplified is performed by a scaling procedure, involving macro-evolution, micro-transport coefficient, and submicro-relaxation. This kinetic approach reproduces the Kolmogoroff spectrum for incompressible turbulence, and derives other spectra for compressible turbulence and plasma turbulence. It is planned to extend to optical turbulence: scintillation at long path, saturation, and optical remote sensing, without the restriction from familiar hypotheses of frozen turbulence, small scales, and Markoff process.

8.0004, MEASUREMENT OF THE VAPOR PHASE COMPOSITION AND PRESSURE FOR LIQUID-VAPOR EQUILIBRIUM IN AQUEOUS SOLUTIONS OF SULFURIC ACID

V.R. Veluri, Clark College, Undergraduate School, Dept. of Physics, *240 Chestnut St. S.W., Atlanta, Georgia* 30314 (NSG 2143)

The thermodynamic parameters needed for modeling the atmospheric aerosol formation are not available. This is particularly true of the sulfuric acid-water system which is important and of contemporary interest.

To meet this, a series of experiments have been initiated which will provide the equilibrium partial pressures of vapor over a sulfuric acid solution for a range of compositions. The technique employs the use of a time of flight mass spectrometer to sample the vapor phase above a sample through a molecular leak inlet. By calculating the response of the system to know pressures of molecular species of interest, the vapor phase partial pressures can be determined. Current work involves the completion of calibrating the system for SO2, SO3, and H2SO4. After calibration is completed, extensive studies of the partial pressures of these substances as a function of liquid phase composition and temperature will be undertaken.

8.0005, NEUTRINO INTERACTIONS AT COSMIC RAY ENERGIES

R.E. Mickens, Fisk University, School of Liberal Arts, Dept. of Physics, *17th Ave. N. & Meharry Blvd., Nashville, Tennessee* 37203 (NSG 5297)

The objective of this research is to obtain estimates of the neutrino-nucleon total cross section at cosmic-ray energies. In particular, we are concerned with the energy interval 10-10 GeV. Recent studies on deep underwater muon and neutrino detection show that in the near future it may be feasible to perform experiments using such ultra-high energy cosmic-ray neutrinos. The design of these experiments will depend, in part, on the value of the neutrino-nucleon cross section; consequently, it is of some interest to have estimates of the neutrino-nucleon total cross estimates of the neutrino-nucleon total cross section over this energy range.

SUPPORTED BY U.S. National Aeronautics & Space Admin., Goddard Space Flight Center

8.0006, OPTICAL CHARACTERIZATION OF ZERO-GRAVITY GROWN CRYSTALS

E. Silberman, Fisk University, School of Liberal Arts, Dept. of Physics, *17th Ave. N. & Meharry Blvd., Nashville, Tennessee* 37203 (NSG 8060)

Preliminary experiments performed in the micro-gravitational field of the Skylab and Apollo-Soyuz flights have shown the possibility of growing better crystals, as compared to the best that can be obtained on the Earth's surface. Further research on the potential of this space technology will be carried out in the Spacelab missions. The experiments have shown the need for better methods of measuring the physical constants of the new crystals. This proposal aims at developing a computerized-scanning-laser illuminated-photoelectrical ultramicroscope which could characterize degrees of crystal perfection. Measurements will be performed on the kind of crystals to be grown in the near future in Spacelab flights.

SUPPORTED BY U.S. National Aeronautics & Space Admin., George C. Marshall Space Flight Center

8.0007, TURBULENCE IN TRANSIENT SOLAR PHENOMENA

M. Cross, Grambling State University, School of Arts & Sciences, Dept. of Physics, *Grambling, Louisiana* 71245

Recent advances have been made in the evolution of a fundamental theory of turbulence based on the physics of microscopic processes. The general use of models based on second moment closure schemes has been shown to be incorrect. In transitional flow, new parameters have been derived from kinetic theory which successfully characterize a variety of fluid and plasma systems with turbulent bursts and turbulence generated by amplified thermodynamic fluctuations. We propose to investigate the implications of these developments for transient solar phenomena. Specifically, we shall begin by extending the modern approaches for the study of unstable fluids to appropriately chosen periodic structures and bursting effects in the solar corona and interplanetary medium. We shall take full advantage of existing data on solar activity and use well established analytical procedures. From this, we expect to gain new insight into the physics of the sun. The cost to NASA for the first year of research would be approximately $30,000.

SUPPORTED BY U.S. National Aeronautics & Space Admin., George C. Marshall Space Flight Center

8.0008, STUDIES OF NEW MEDIA FOR RADIATION-INDUCED LASERS

K.S. Han, Hampton Inst., Graduate School, Dept. of Physics, *Hampton, Virginia* 23368 (NSG 1595)

The objective of this study is to search the laser material which would be suitable to solar pumped lasing. For a suitable solar pumped laser material, the following conditions are required: (1) good overlapping between solar spectrum and absorption spectrum of the laser medium, (2) broad band laser pumping mechanism, (3) efficient energy handover from energy storage medium to lasing medium, (4) low threshold to match a reasonable solar concentration (since solar radiation intensity has only 1.4 kWatts/sq. cm without any concentration service), (5) high power efficiency. The first laser medium we investigated was the iodine laser lasing at 1.315 microns. The iodine laser (usually lasing an organic compound CF3 I or C3FI) has broadband absorption from 250 microns to 290 microns and when flashed by xenon flashlamp, C3F3I or C3FI is photodissociated and produces an iodine atom in the P excited states.

In our preliminary study, the laser efficiency with respect to iodine pumping band was measured to be 3 percent. The solar radiation has low power density at the iodine laser pumping band. Therefore the buildup time is long. Iodine laser was also showing the laser action at the substantially higher temperature. This is encouraging because solar pumped laser will have to operate at higher than room temperature in order to make the laser medium absorb heat.

The further study of the lasing material will be centered around CF3I, IBr, NOCl laser for their compatibility for solar pumping mentioned earlier.

SUPPORTED BY U.S. National Aeronautics & Space Admin., Langley Research Center

8.0009, FEASIBILITY OF USING TEKTITES AND OTHER SPACE RELATED GLASSES FOR THE CONTAINMENT OF NUCLEAR WASTES

A.M. Thorpe, Howard University, Graduate School of Arts & Sciences, Dept. of Physics & Astronomy, *2400 6th St. N.W., Washington, District of Columbia* 20001 (NAS 5-25185)

Low temperature magnetic susceptibility measurements, extensive infrared spectra measurements, electron microscopy observations, electron microprobe analysis, Mossbauer spectra, and standard visual techniques will be used to determine if tektites or other space related glasses can be candidates for long term storage of nuclear waste materials.

The effects of radiation damage on the structure of these glasses will be examined by subjecting them to extreme amounts of radiation, and then performing magnetic, Mossbauer and infrared property studies which will determine if the basic glass structure has been affected. Infrared and electron microscopy studies of these glasses will be made before and after severe hydration, which will determine the amount of water contained and the progress of the water through the glasses. Further studies will be made by subjecting these glasses to many different high temperatures for various time periods and measuring the devitrification by use of the above standard solid state techniques. The results of these measurements will be extrapolated to long periods of time at ordinary temperatures.

SUPPORTED BY U.S. National Aeronautics & Space Admin., Goddard Space Flight Center

8.0010, RESEARCH IN ELECTRON SPECTROSCOPY

T. Tsang, Howard University, School of Liberal Arts, Dept. of Physics & Astronomy, *2400 6th St. N.W., Washington, District of Columbia* 20001 (NGR 09-011-057)

The objective of the research is the basic understanding of surface physics. The radiation damages of transition metal sulfides under ion bombardment have been studied by photoelectron spectroscopy. Under inert gas ion bombardment, decomposition to metal and elemental sulfur was observed. However, there is considerable difference between the dosages required to induce decomposition, differing by a factor of 200 between iron sulfide and copper sulfide. On the other hand, under oxygen ion bombardment, the predominant process appears to be ion-surface chemical reactions. Again, the dosages required for oxidation differ considerably. In particular, we note that the rate of ion-surface chemical reactions is inversely correlated with the rate of impact-induced decomposition. These results suggest systematics for radiation damages under ion bombardment.

8.0011, OPTICALLY PUMPED SUBMILLIMETER WAVES AND APPLICATIONS

J.M. Dutta, North Carolina Central University, School of Arts & Sciences, Dept. of Physics, *1805 Fayetteville St., Durham, North Carolina* 27707 (NSG 5120)

Recently there has been a greatly increased interest in far infrared spectroscopy of the atmosphere for the study of certain trace gas constituents of the upper atmosphere. Present investigations using conventional interferometric spectrometers have limited ability to separate the weak lines of trace gases from the dominant lines of other gases due to their poor resolving power. The proposed effort is to construct a tunable high resolution spectrometer based on a far infrared laser. A compact, stable FIR laser has been constructed and alternate stabilization schemes such as an optoacoustic technique are being tested. Various Schottky diodes and mixer structures are also being investigated for their suitability in a heterodyne spectrometer. Part of the proposed effort is the continuation of these investigations with the ultimate goal of constructing a high resolution far infrared spectrometer suitable for the study of trace gases present in the upper atmosphere.

SUPPORTED BY U.S. National Aeronautics & Space Admin., Goddard Space Flight Center

8.0012, CRYSTAL STRUCTURE AND CATALYTIC PROPERTIES OF NOBLE METAL-RARE EARTH ALLOYS

W.E. Collins, Southern University Agricultural & Mechanical College, Baton Rouge Campus, College of Sciences, Dept. of Physics, *Southern Branch P.O. Box 9674, Baton Rouge, Louisiana* 70813

The catalytic properties of many noble metals can be improved by judicious rare earth additions. It is proposed in this project that the catalytic properties of two kinds of noble metal alloys be studied: (a) Noble metals containing trace amounts of rare earths, and (b) Noble metal-rare earth alloys with intermediate phases. Iridium, ruthenium, rhenium, platinum, etc. noble metals shall be alloyed with cerium, neodymium, etc. light rare earths and their catalytic properties in hydrogenation, etc. reactions studied. The types of crystallizations and phase equilibria in many of the noble metal-rare earth alloy systems are not known. It is also of interest to determine the crystal structures of intermediate phases in binary systems of selected rare earths with iridium, ruthenium, rhenium and platinum. This study is to determine the bonding behavior among transition metals of Group III and Group VIII and to establish the alloy theory for transition metal alloys.

A separate phase of the research program would look into the physical properties of these alloys, especially of those used in the catalyst study. The electrical resistivities of selected alloys shall be studied as a function of temperature in the cryogenic ranges. The effects of rare earth additions on the properties of the noble metals would be analyzed critically.

8.0013, THERMODYNAMIC PROPERTIES OF SULFURIC ACID AT TEMPERATURES IMPORTANT TO THE ATMOSPHERE

R.A. Morrison, Talladega College, Undergraduate School, Dept. of Physics, *Talladega, Alabama* 35160 (NSG 2217)

Our initial determination of the total pressure in equilibrium with highly concentrated sulfuric acid has now been reported. The values are in reasonable agreement with other recent ones reported by Roedel. Uncertainties in our low-temperature measurements were larger than expected, and an improved design has been completed to solve this problem. The new design will also allow measurements at lower temperatures. Construction of the partial-pressure-measuring device continues.

Our initial theoretical calculations used ideal gas assumptions. The results clearly showed their inadequacy. Theoretical techniques using statistical molecular theory have been designed to use the existing data to determine the pair correlation potential. Once determined, the pair correlation potential should reliably predict the thermodynamic properties of the acid at stratospheric temperatures. Our work, then, will not only focus on the total and partial pressures, it will also predict energies, entropies, and heat capacities (for example).

We will start the study of other sulfur compounds that may have a lower vapor pressure than sulfuric acid at stratospheric temperatures: dithionic, peroxi-di-sulfuric, and peroxi-mono-sulfuric acids.

SUPPORTED BY U.S. National Aeronautics & Space Admin., Ames Research Center

8.0014, SIZE EFFECT STUDIES OF THIN METAL FILMS

S.J. Brient, University of Texas, El Paso Campus, School of Science, Dept. of Physics, *El Paso, Texas* 79902 (NSG 3146)

Size effect parameters of thin metal polycrystalline films are to be obtained by direct comparison with their epitaxial form. The comparison will be made on a series of films of different thicknesses formed during the same evaporation. A high substrate temperature necessary to form the epitaxial films during evaporation while holding the polycrystalline films at room temperature will be made possible by using a split substrate holder with the two halves held at different temperatures. Attempts will be made to vary the upper film surface roughness as well as obtain experimental values of 'bulk' resistivity and mean free path. These values of resistivity, mean free path, and specularity parameter will then allow the polycrystalline films to be analyzed according to the Mayadas-Shatzkes theory. The split substrate system has been fabricated and temperature from 100K to 600K have been obtained while electrically contacting the films.

SUPPORTED BY U.S. National Aeronautics & Space Admin., Lewis Research Center

8.0015, EXCITATION CROSS-SECTION MEASUREMENTS OF ATMOSPHERIC INTEREST

H.D. Morgan, University of the District of Columbia, Graduate School, *1025 Vermont Ave. N.W., Mt. Vernon Sq. Campus, Washington, District of Columbia* 20005 (NSG 5192)

Most of our research program consists of extending absolute emission cross section measurements of atomic nitrogen, atomic oxygen and hydrogen into the extreme ultraviolet (500-1100 angstroms), where there are few reported measurements in the literature. Such experiments will furnish useful results for further investigation of the earth's aurora, the day-glow planetary atmospheres and stellar spectra.

The design of the experiment involves the excitation of atoms by electrons in a chamber attached to the entrance slit of a normal incidence monochromator and the detection of photons by pulse counting techniques. An electrostatically focused electron gun is used to bombard the atomic species in the excitation chamber. Photons emitted by the atom pass through the entrance slit and are dispersed by a diffraction grating, then detected by a photomultiplier tube at the exit slit. The resulting pulses are stored in a multichannel analyzer which scans through each channel as the wavelength or voltage to the electron gun is varied with time. Two spectrums can be produced (intensity vs the wavelength or intensity vs electron energy). Cross sections of the excited states, the excitation mechanism and their minimum thresholds can then be determined from the spectra.

At the present the experimental apparatus has been fabricated and constructed. Emission cross sections resulting from electron impact on N2 and O2 have been remeasured and the results are being prepared for publication. Problems remain in determination of the atomic specie density used in calculating cross sections resulting from electron impact on atomic oxygen and nitrogen. Progress is being made in this area, but much remains to be done.

SUPPORTED BY U.S. National Aeronautics & Space Admin., Goddard Space Flight Center

8.0016, CONTINUATION OF PARTIAL DISCHARGE TESTING/STUDY OF EFFECTS OF SURFACE CHARGING DUE TO GEOMAGNETIC SUBSTORMS

E.L. Walker, University of the District of Columbia, School of Engineering Technologies, Dept. of Physics, *4100 Connecticut Ave. N.W., Washington, District of Columbia* 20008 (NGR 09-053-003)

The phenomena of high-voltage DC partial discharges is being investiated; this involves life testing of various electrical components commonly found on spacecraft. Also being investigated are the effects of DC discharges in vacuum. The effects of low-voltage DC discharges on spacecraft components is studied, using a high-resolution power supply. This will be followed by a study of effects on components of discharges due to voltages consisting of AC superimposed on DC; primary emphasis here will be on the laboratory feasibility of such a study.

A detailed investigation of various kinds of breakdown phenomena in semiconductor devices used on geosynchronous spacecraft is being made, with emphasis on the plasma approach (both solid-state and gaseous state). This involves a theoretical treatment based upon appropriate plasma and other models, coupled with experimental testing of said models, wherever feasible.

The effects of long-term electron bombardment on spacecraft electrical components is being ascertained in an effort to better understand the results of geomagnetic substorms on such components. The type and degree of possible damage to various exposed surfaces such as solar panels is being investigated; progress on testing of the TDRSS solar panel at Lewis Research Center is being monitored. Support will be given the effort to adapt all or part of the NASCAP computer code to the Goddard Space Flight Center computing system, in order to predict the electric potential in a magnetospheric environment and the resulting arcing from electrically active spacecraft.

Undertakings are joint active efforts involving personnel from the Goddard Space Flight Center, Lewis Research Center, and the University of the District of Columbia.

SUPPORTED BY U.S. National Aeronautics & Space Admin., Goddard Space Flight Center

8.0017, MATERIAL SCIENCE AND SOLID-STATE PHYSICS STUDIES WITH POSITIVE MUON SPIN PRECESSION

C.E. Stronach, Virginia State College, Graduate School, Dept. of Physics, *Petersburg, Virginia* 23806 (NSG 1342)

This project utilizes the precession of polarized positive muons, and their parity-violating decay, to study properties of solids.

By measuring the precession rate of muons the magnetic field at interstitial sites in ferromagnets may be determined and the hyperfine contact field arising from conduction electron polarization may be extracted. Of particular interest is the variation in the hyperfine field with the introduction of various nonmagnetic impurities. Studies of Fe(Al), Fe(Mo), Fe(Nb) and Fe(Ti) suggest systematic variations occur as functions of the impurity type.

The rate of depolarization of the precession signal provides a measure of the diffusion rate of muons. Thus trapping of muons, which produces depolarization, can be observed and used to test for impurities, defects, dislocations, and strains. The depolarization rate of muons in low-temperature high-purity Al, for example, is very sensitive to the amount and type of impurities present.

These studies are continuing at the TRIUMF cyclotron. The next run is scheduled for November 1979.

SUPPORTED BY U.S. National Aeronautics & Space Admin., Langley Research Center

8.0018, MEDIUM-ENERGY NUCLEAR PHYSICS STUDIES

C.E. Stronach, Virginia State College, School of Science & Technology, Dept. of Physics, *Petersburg, Virginia* 23806 (NSG 1646)

This project utilizes medium-energy probes to study nuclear structure and reactions.

The primary emphasis is on studies of pion reactions in which coincidence events between outgoing charged particles and nuclear de-excitation gamma rays are observed. These coincidence spectra will enable us to distinguish, for example, between pion absorption and pion survival events. The spectra of charged particles should indicate for absorption events whether the pion's rest mass is shared by the nucleus as a whole, or whether the absorption process occurs with significant frequency upon smaller segments of nuclei. We anticipate performing a series of these experiments at the LAMPF LINAC in March 1980.

Another area of study is (p,d) reactions. Polarized protons and a magnetic spectrometer are used to measure differential cross sections and analyzing powers for deuteron production. The results are strongly dependent upon the j values of the final nuclear states, and suggest that (p,d) analyzing powers may allow reliable j assignments at intermediate energies and provide a valuable tool for identification of deep-hole strengths. We anticipate performing a series of these experiments at the TRIUMF cyclotron in December 1979.

Analogous experiments with photon and heavy-ion probes are under consideration.

SUPPORTED BY U.S. National Aeronautics & Space Admin., Langley Research Center

8.0019, CALCULATION OF TOTAL CROSS SECTIONS FOR CHARGE EXCHANGE IN MOLECULAR COLLISIONS

J.W. Ioup, Xavier University of Louisiana, School of Arts & Sciences, Dept. of Physics, *7325 Palmetto St., New Orleans, Louisiana* 70125 (NSG 1361)

Previous research accomplished under this grant included the theoretical investigation of low-energy collisions of nitrogen ions with nitrogen molecules. Theoretical developments and calculations reported in the literature were applied to experimental data obtained by Dr. Al Smith of the Instruments Research Division at NASA Langley Research Center. The application of these techniques to gas-gas/surface and gas-surface charge transfer collisions was also studied.

As part of their investigation of these reactions, experimentalists must select ions for mass and energy before the collision

and analyze the same properties after. In order to increase the understanding of these devices, the 127 degrees cylindrical electrostatic analyzer and the quadrupole mass spectrometer were studied. Analytical expressions have been obtained for the transmission of the 127 degrees cylindrical electrostatic analyzer as a function of energy and two input angles for the entrance slit smaller than, equal to, and larger than the exit slit. Low-current selector and analyzer outputs for assumed energy and angle input distributions as well as broadening curves have been obtained.

A computer model of the quadrupole mass spectrometer has been developed. The path of an ion through the spectrometer may be calculated as well as the fraction of incident particles which are transmitted. The effects of fringing fields and of varying the pole piece separations (tilting the pole pieces) are being investigated.

SUPPORTED BY U.S. National Aeronautics & Space Admin., Langley Research Center

8.0020, SOLAR RADIATION MEASUREMENT PROJECT

J.W. Ioup, Xavier University of Louisiana, School of Arts & Sciences, Dept. of Physics, *7325 Palmetto St., New Orleans, Louisiana* 70125 (NSG 8050)

The purpose of this research project is to obtain measurements of the solar radiation incident at New Orleans. These measurements include the direct and the diffuse solar flux, the total amount of incident solar radiation per day with its distribution in time over the daylight hours, and infrared and ultraviolet data. Climatic measurements include temperature, barometric pressure, humidity, rainfall, and cloud cover, and atmospheric particulate measurements will be made of the correlation of these data with the insolation. The reliability and accuracy of instruments such as those using silicon photovoltaic cells will be tested by comparison with standard equipment. Data acquisition, storage, and analysis is performed under microcomputer control. Initial measurements are being made at the Xavier University campus with future data collection at various locations throughout the city and surrounding area.

8.0022, MOLECULAR BEAM CARS SPECTROSCOPY

R.L. Byer, Stanford University, School of Humanities & Sciences, Dept. of Applied Physics, *Stanford, California* 94305 (CHE79-12673)

Professor Byer is supported by a grant from the Structural Chemistry and Thermodynamics Program and the Atomic, Molecular, and Plasma Physics Program to carry out detailed high resolution spectroscopic measurements. The major emphasis of Byer's work will be the study of pulsed molecular beams in order to enhance spectral and structural details for important molecular systems such as methane and sulfur hexafluoride. Thus, Byer will be combining state-of-the-art high vacuum technology with high powered laser systems to develop further the utility of coherent anti-Stokes Raman spectroscopy (CARS). The extension of high resolution CARS to sub-Doppler linewidths will provide precise absolute frequency measurements and improve considerably the resolution of complex spectra. A second area of study will be the Raman spectra of hydrogen and deuterium. The purpose of studying hydrogen in a molecular beam is to improve significantly the precision of the measured Raman vibrational frequencies and to verify the isotopic shift of the molecular vibration which is a direct test of the validity range for the Born-Oppenheimer approximation.

This research is a continuation of that currently supported by Foundation Grant, CHE-7621987.

8.0023, GENERAL RELATIVITY AND COSMOLOGY

R.K. Sachs, University of California, Berkeley Campus, School of Letters & Science, Dept. of Mathematics, *Berkeley, California* 94720 (PHY79-13146)

Research in theoretical gravitational physics initiated under NSF grant PHY77-1519A01 will be continued. Among the topics to be investigated are: 1) inhomogeneous cosmologies 2) particle production in cosmological models.

This is the first year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Physics

8.0024, HIGHLY NONLINEAR PHENOMENA AND PHYSICS OF CONFINEMENT

A.Y. Wong, University of California, Los Angeles Campus, School of Letters & Science, Dept. of Physics, *405 Hilgard Ave., Los Angeles, California* 90024 (PHY79-08480)

A three-year program will systematically study three important topics in plasma physics. The first program involves highly nonlinear phenomena in plasmas, including the investigation of the generation and interaction of Langmuir solutions to verify the predictions of the nonlinear Schrodinger equation. The second program involves the conversion of electrostatic waves to electromagnetic waves. The electrostatic waves will be generated by the beam-plasma instability will also be studied. The third program involves particle transport in an axisymmetric magnetic field configuration with and without magnetic perturbations. In order to extend this study to the high temperature regime, a complementary university/industry collaboration effort will be carried out. Hughes Research Laboratories will develop high perveance neutral beam (2-5 keV, 50 amp) jointly with UCLA. This source is expected to raise the ion temperature in the Dodecapole to several hundred electron volts.

This is the fist year of a three-year continuing grant, a continuation of research begun under PHY7707160 A01.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Physics

8.0025, STUDIES OF GAMMA RAY LINE EMISSION FROM ASTROPHYSICAL SOURCES

R.E. Lingenfelter, University of California, San Diego Campus, Graduate School, Dept. of Physics, *P.O. Box 109, La Jolla, California* 92037 (AST79-11987)

This research will be concerned with theoretical studies of the high energy gamma-ray line emission from astrophysical sources. The following problems will be considered; 1) There will be a calculation of the deexcitation line emission spectra and individual line emissivities resulting from thermonuclear reactions at ion temperatures in excess of one billion degrees Kelvin. 2) There will be an investigation f the cross sections and luminosities of various neutron producing reactions which are important in such high temperature interactions. 3) There will be a calculation of the neutron and positron production rates in thermonuclear reactions at these temperatures. 4) Calculations will be made of the gravitationally and Doppler shifted gamma-ray line emission spectra which might be expected from various models of accretion around a neutron star or a black hole. 5)

There will be a comparison of these emission spectra with the gamma-ray line emission that has been reported from the galactic center and Centaurus A.

8.0026, SURVEY OF ATOMIC AND MOLECULAR SCIENCE

C.K. Reed, National Academy of Sciences, *2101 Constitution Ave. N.W., Washington, District of Columbia* 20037 (PHY78-25026)

The National Academy of Sciences, through its Committee on Atomic and Molecular Science (CAMS), will conduct a study and prepare a report to characterize the present state of research in atomic and molecular science. Included in the characterization will be information on numbers of research workers and nature of research activities, geographical location, types of research organizations participating, demographic information, training, and levels and sources of support. Universities, national laboratories, and industry will be surveyed. On the basis of such data the Committee will prepare a report on the status, health, and needs of the field.

8.0027, THEORETICAL STUDIES OF THE INTERACTION OF RADIATION WITH MATTER

S.T. Manson, Georgia State University, School of Arts & Sciences, Dept. of Physics, *33 Gilmer St. S.E., Atlanta, Georgia* 30303 (PHY76-80123)

Research in theoretical atomic physics initiated under NSF Grant PHY72-05156 A01 will be continued. This research will focus on: 1. Investigate within the framework of Born approximation, the energy and angular distribution of electrons ejected by fast charged particle impact ionization of atoms. 2. Calculate, within the same framework, inelastic scattering form factors, generalized oscillator strengths, and energy loss cross sections for fast charged particle impact ionization of the atomic subshells of selected elements, as well as to determine their contributions to the total ionization cross section and stopping power. 3. Study the angular distribution of photoelectrons from open shell atoms, where the effects of anisotropic interactions play an important role, as well as other topics of interest in photoelectron spectroscopy such as satellite lines. 4. Explore the behavior of the cross section for the photoionization of selected excited states of various atoms. The results of the calculations will serve to provide further insight into the basic nature of these fundamental atomic processes which are of importance in plasma physics, atmospheric, solar, and astrophysics, radiation physics and for studies of the transport of energy from the site of thermonuclear reaction.

8.0028, A PROGRAM OF RESEARCH IN FAST ION SPECTROSCOPY

H.G. Berry, University of Chicago, School of Physical Sciences, Dept. of Physics, *5801 S. Ellis Ave., Chicago, Illinois* 60637 (PHY78-27635)

Studies will continue of the interaction of fast atoms with thin foils, and of the processes involved as the atoms pass through the surface into vacuum. In addition, the scattering of atoms from surfaces at oblique angles will be studied. A model will be constructed to describe the collision processes involved.

This work is a continuation of that supported by NSF Grant PHY76-81960A01.

Sciences, Div. of Physics

8.0029, SYNCHROTRON RADIATION STUDIES OF MATTER

F.C. Brown, University of Illinois, Urbana Champaign Campus, School of Liberal Arts & Sciences, Dept. of Physics, *Urbana, Illinois* 61801 (DMR76-20644)

High-resolution measurements of photoabsorption cross-sections will be extended to the carbon, oxygen, and nitrogen K edges in simple polyatomic gases. The experiments will be carried out using a new ultrahigh vacuum monochromator recently installed at the Stanford Synchrotron Radiation Project. The results will be compared with at threshold calculations of the highly excited states of molecules using ab initio theory. It is expected that the theory of extended absorption fine structures can be applied far above threshold. In addition, extreme ultraviolet photoabsorption experiments will be carried out at the Physical Sciences Laboratory, Stoughton, Wisconsin. These will include studies of the selenium 3d-level absorption threshold in layer type titanium di-chalcogenide crystals with controlled transition metal excess.

Sciences, Div. of Materials Research

8.0030, HIGH-MAGNETIC-FIELD SUPERCONDUCTIVITY AND MAGNETISM IN TRANSITION METALS AND ALLOYS

R.R. Hake, Indiana University, Bloomington Campus, School of Arts & Sciences, Dept. of Physics, *Memorial Hall, Bloomington, Indiana* 47401 (DMR77-10545 A02)

Research begun under NSF grant No. DMR7509940 will be continued and extended. A broad experimental program in the study of high magnetic field superconductivity in the transition-metal alloys will be undertaken and a major part of the program will involve the relationship between superconductivity and magnetism. Three areas of study are: 1) fluctuation effects and Type II superconductivity, 2) normal state electronic properties of disordered transition-metal alloys, and 3) spin glasses and Kondo systems.

8.0031, APPLICATION OF SOFT MODE ANALYSES TO THE LATTICE DYNAMICS OF DNA AND RNA HELICES

E.W. Prohofsky, Purdue University, School of Science, Dept. of Physics, *Executive Bldg., West Lafayette, Indiana* 47907 (DMR7820602)

Research previously supported by DMR7414367.

This project is a theoretical study of the dynamics involving mass displacement of the DNA and RNA helices. In particular those atomic motions which involve change in shape of helices will be studied. Such changes in shape are brought about by changes in environment or by interaction with biological molecules. It is believed that these changes in shape are involved in the biological functioning of these macromolecules. The method used is that of soft mode analysis originally used to study displacive phase change in crystalline solids. The method involves calculating the onset of instabilities in the vibrational behavior of a system which leads to changes in shape. A necessary part of this project is the development of accurate models of the vibrational behavior of the helices. Methods will be developed and used on the refinement of the vibrations from observations of the infrared absorption and Raman scattering DNA and RNA. The effect of counterions and water of hydration on the vibrations as well as on the shape is to be investigated. The previous successful theory for the B to A DNA change is to be improved and extended to other DNA systems.

This is the first year of a three-year continuing grant.

Sciences, Div. of Materials Research

8.0032, EXPERIMENTAL AND THEORETICAL INVESTIGATIONS OF INTERACTION OF INTENSE RADIATION WITH ATOMS

S. Earkiel, Massachusetts Inst. of Technology, School of Engineering, Dept. of Aeronautics & Astronautics, *77 Massachusetts Ave., Cambridge, Massachusetts* 02139 (PHY79-09739)

This research program is concerned with experimental and theoretical investigations of atom-field interaction and related phenomena. This includes the development of an ultra stable cw dye laser which is essential for probing the incredibly narrow features recently uncovered in multi-level interactions, the experimental study of the behavior of 3-level and 4-level system in weak and intense fields, theoretical studies of bistability which may lead to some experimental investigations, and some theoretical calculations of the behavior of multi-level systems in the presence of Doppler and collisional broadening. Finally, some high precision spectroscopy on a dense cold beam of hydrogen is proposed.

This research is a continuation of that previously supported under NSF grant PHY77-07156A01.

This is the first year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Physics

8.0033, SCATTERING SPECTROSCOPY OF LIQUID CRYSTALS

O.D. Lister, Massachusetts Inst. of Technology, School of Science, Dept. of Physics, *77 Massachusetts Ave., Cambridge, Massachusetts* 02139 (DMR78-23555)

Liquid crystalline materials have phases with varying degrees of order intermediate between the total lack of long-range order in liquids and the nearly complete order of crystalline solids. The rich diversity of phases present in these systems affords an opportunity to elucidate the phenomenon of melting and to provide fundamental understanding of why various condensed phases of matter exist and have the properties they do.

Quasielastic light scattering from the normal modes resulting from long range orientational ordering is combined with ultra high resolution X-ray scattering spectroscopy to examine simultaneously positional ordering and its interaction with the orientational order of the molecules in smectic -A, smectic C, and the well ordered smectic B-like phases of liquid crystals. Picosecond time resolved spectroscopy is used to study molecular motion. Recently developed techniques in submicron technology will be used to study the interaction of liquid crystals with surfaces and to prepare well aligned samples of the various phases. The results are expected to provide valuable information on the properties of liquid crystals as well as insight into the role of symmetry and spatial dimensionality in determining which phases of condensed matter can exist in nature. They should be relevant also to lower dimensional physics. In particular, they should aid in understanding the phenomenon of melting in two dimensions. This is a continuation of work supported by DMR76 18035. It is the first year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0034, LIGHT SOURCE PROJECT

W. Parkinson, Smithsonian Institution, Astrophysical Observatory, *60 Garden St., Cambridge, Massachusetts* 02138 (31A-4A50-02)

Initiated plans to extend our atomic and molecular spectroscopy program to include quantitative measurements of the basic parameters of highly ionized atoms such as excited-state lifetimes, fluorescence decay branching ratios, wavelengths and collision and absorption cross sections. Initiated this work with a program to develop a new spectroscopic source of multiply ionized atoms that will possess several unusual features that are expected to eliminate many of the uncertainties that are associated with the more conventional sources. The new device will be built around a high-current hot-cathode oscillatory discharge ion source that was developed by G.S. Mavrogenes, W.J. Ramler and C.B. Turner at the Argonne National Laboratory as an adjunct to the design of a high-power heavy-ion cyclotron.

SUPPORTED BY Smithsonian Institution, Astrophysical Observatory

8.0035, EXPERIMENTAL STUDY OF THE PHYSICAL AND ELECTRONIC PROPERTIES OF LIQUID TRANSITION METALS AND TRANSITION-LIKE METALS AND ALLOYS

J.B. Van Zytveld, Calvin College, Undergraduate School, Dept. of Physics, *1331 Franklin St. S.E., Grand Rapids, Michigan* 49506 (DMR79-09969)

Certain electronic and physical properties of solid and liquid transition metals and transition-like metals will be measured at high temperatures. Experiments include: measurements of resistivity and thermopower of the iron series transition metals from room temperature to above their melting points: measurements of resistivity and thermopower of solid and liquid europium and also the liquid allow strontium-barium; measurements of the density of liquid europium and ytterbium, and also of the liquid alloys magnesium-calcium, magnesium-strontium and magnesium-barium. These measurements will permit tests of recent theoretical work on the electronic and thermodynamic properties of liquid metal systems.

This is the first year of a three-year continuing grant; research was previously supported by DMR 7705213.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0036, IONOSPHERIC PLASMA PROCESSES

R. Sudan, Cornell University, Ithaca Campus, Lab. of Plasma Studies, *159 Sapsucker Woods Rd., Ithaca, New York* 14850 (DN980183; N00173-77-C-240)

The DOD is becoming increasingly dependent upon satellite systems for communication, surveillance and navigational purposes. It has become increasingly evident over the past few years that turbulent structure developing in the ionosphere can adversely affect the transmission of satellite signals. This affect manifests itself in fluctuations in the phase and amplitude of the transmitted signal. The objective of the current program is to assist in identifying the cause and characterizing the properties of the relevant ionospheric plasma turbulence. This information is needed in order to provide prediction of satellite systems performance.

Modern theories of strong plasma turbulence are employed to characterize turbulence in the ionized component of the E and F regions on the ionosphere. The results of these calculations are compared with numerical studies performed at NRL and with radar data taken in the field.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Research Lab.

8.0037, THERMAL CONDUCTIVITY OF CONFINED HELIUM-4 AT THE SUPERFLUID TRANSITION AND SPECIFIC HEAT OF HELIUM-3 ON THE SURFACE OF HELIUM-4

F.M. Gasparini, State University of New York, Buffalo Campus, School of Arts & Sciences, Dept. of Physics & Astronomy, *3435 Main St., Buffalo, New York* 14214 (DMR77-11325 A01)

This is a continuation and extension of research supported under NSF Grant No. DMR-7711325. Thermal conductivity experiments will be performed on liquid helium confined to dimensions of the order of, or less than, 200A. Such data obtained in the region of the lambda transition, will test current ideas with regard to finite-size scaling effects on the thermodynamical properties of this unique quantum fluid. Heat capacity studies of helium-3 films on the surface of helium-4 confined in 2000A nucleopore filters will continue. In this work a helium-4 film (30-50A thick) is initially formed, upon which helium-3 is deposited to produce a film between 0.05 and 1.0 atomic layers. These helium-3 films behave as two-dimensional gases and provide readily available systems for the use of specific heat techniques

to study two-dimensional phase transitions--a topic of high scientific interest.

8.0038, PHYSICS AND TECHNOLOGY OF MATERIALS

N. Spielberg, Kent State University, School of Arts & Sciences, Dept. of Physics, *Hilltop Dr., Kent, Ohio* 44240 (SER78-00596)

Three new courses will be developed as an integrated introduction to materials science for Technology and other students, as well as for specialists. Prerequisites for these courses are one year of introductory physics and two quarters of calculus. The first course covers the application of selected concepts from modern condensed state physics to the electrical, magnetic and optical properties of solids. The second and third courses will deal with material science and physical metallurgy. The courses will be designed to maximize student comprehension of the ways in which basic physical concepts contribute to understanding and utilization of the technical properties of materials. The project calls for (1) intensive joint development by Physics and Technology faculty, review of applicable pedagogical material, and design of evaluation procedures during the first summer of the program; (2) teaching of the courses with ongoing evaluation and minor revision during the following academic year; (3) major revision as required during the second summer; and (4) a second round of teaching to establish the courses permanently in the curriculum. With the present student body makeup, 40 or 50 students per year will be served. The courses should also be suitable for evening and extension students. The detailed lecture notes and other material developed should be of value for ongoing use in these and other courses.

SUPPORTED BY U.S. National Science Foundation, Directorate for Science Education, Div. of Science Education Resources Improvement

8.0039, THEORY OF CRYSTALLINE ELECTRONS IN MAGNETIC FIELDS

G.H. Wannier, Oregon State Higher Education System, University of Oregon, School of Liberal Arts, Dept. of Physics, *1472 Kincaid St., Eugene, Oregon* 97401 (DMR79-04837)

Research previously supported by DMR7706736.

Theoretical research on the behavior of the electronic structure of solids under the influence of a magnetic field. This theory is well understood in the weak and strong field limits. This research will deal with the problem in the intermediate region, i.e., between 10 Kilogauss and 10 Gigagauss. The theory will be developed with the aim of understanding the extra fine structure superimposed on the simple picture of an electron in a magnetic field. The difficulties of handling the irrational field case will be avoided by concentrating on the calculation of the density of states. Also, the possibility of approaching the problem by means of localized (Wannier) functions will be investigated.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0040, PROPERTIES OF THE GENERALIZED SCHOTTKY BARRIER

H.K. Henisch, Pennsylvania State University, University Park Campus, School of Science, Dept. of Physics, *211 Whitmore Lab., University Park, Pennsylvania* 16802 (INT77-04433 A01)

This research is concerned with metallic contacts on semiconductors and, in particular, with calculations relating to the properties of Schottky barriers. Traditional work in this area has involved many simplifying assumptions that are customarily introduced in order to make analytic solutions possible. In contrast, the complete transport equations can only be solved numerically by computer. The research in progress under this grant aims at such solutions for semi-infinite contact systems of arbitrary barrier height, barrier mobility ratio, barrier lifetime, and dielectric relaxation time, with special reference to the interaction between the barrier region itself and the bulk region immediately adjoining. Solutions free from these restraints have never been reported. The project also examines the consequences of current-dependent charges in surface states, and the special conditions which prevail at semiconductor-semiconductor contacts. These considerations are relevent to solar cell efficiency and its optimization.

The project represents the continuation of a collaboration between physicists and electrical engineers at Penn State University and the Venezuelan Institute for Scientific Research (previously funded by grant INT 77-04433 and the Venezuelan National Council for Scientific Research).

SUPPORTED BY U.S. National Science Foundation, Directorate for Scientific Technological & Internat. Affairs, Div. of International Programs

8.0041, PIEZO-OPTIC PROPERTIES OF CERAMIC MATERIALS

K. Vedam, Pennsylvania State University, University Park Campus, School of Science, Dept. of Physics, *211 Whitmore Lab., University Park, Pennsylvania* 16802 (DMR76-82074)

This research will be concerned with two aspects of the piezo-optical properties of ceramic materials at high pressure, namely: (1) variation of the refractive index of solids with pressure to 100 kbars, and (2) variation of the optical rotary dispersion and circular dichroism in crystals with pressure. The materials to be studied include paratellurite (TeO2), hexagonal selenium, the gyroelectric material 5P50 3GeO2, and benzil. In all of these crystals, the desired optical absorption occurs at or near the visible spectrum, which should facilitate the experiments on effects of pressure and temperature on the optical properties.

The studies are of theoretical interest and also will be of value from the technological point of view, such as the development of suitable materials for a variety of acousto-optic device applications.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0042, EXPERIMENTAL AND THEORETICAL INVESTIGATION OF THE TRANSPORT PROPERTIES OF SEMICONDUCTING SURFACE INVERSION LAYERS

P.J. Stiles, Brown University, Graduate School, Dept. of Physics, *University Hall, Box 1883, Providence, Rhode Island* 02912 (DN675521; N00014-76-C-0894)

As solid-state devices such as field-effect-transistors that are found in naval electronic systems become more compact and more surface oriented in their electrical transport behavior, they begin to be dominated by surface related effects. This program will seek to find better understanding of the surface related effects on the electrical properties of the compound semiconductor materials that make up the devices.

The investigators will seek a theoretical and experimental understanding of the physics of charge transport in compound semiconductor surface inversion layers. Experimental work will address the formation of good insulators on the surfaces and will characterize the transport in the surface inversion layer through mobility and magnetic transport effects. Theoretical studies will consider effects of exchange correlation, resonant screening, and final state interactions on the subband separation, and the effects of finite magnetic fields on effective mass and effective g value. A new consideration is the idea of surface channel tunneling as it relates to a FET device used to study subband properties.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

8.0043, DYNAMIC MEASUREMENTS IN LIQUID CRYSTALS

S.V. Letcher, University of Rhode Island, School of Arts & Sciences, Dept. of Physics, *Kingston, Rhode Island* 02881 (DMR79-06785)

Knowledge of the properties of liquid crystal phases and of the ion transitions between them has increased dramatically

over the last decade. Many aspects of their dynamical properties, especially near phase transitions, remain unclear. For example, both theoretical and experimental studies have yielded contradictory results for shear viscosities near phase transitions. Further careful experiments on dynamical properties, therefore, are needed.

In the present work are studied the shear properties of oriented liquid crystal phase. Particular attention is given to the dynamics of the smectic A-smectic B phase transition and to the reentrant nematic phase. The former problem has been stimulated by the apparent similarity of the A-B transition to two-dimensional melting and the recent theoretical advances in that field. Shear impedance changes and shear stresses at very low rates are measured. Measurements of the anisotropic viscosity of the reentrant nematic and its relation to those of the high temperature nematic and intermediate smectic phases promise to be a good test of the model for that system.

Renewal of work supported by DMR77-07813.

SUPPORTED BY U.S. National Science Foundation,
Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0044, REACTIVE COLLISION PROCESSES INVOLVING ATOMS, MOLECULES AND SURFACES

N.F. Lane, Rice University, School of Natural Sciences, Dept. of Physics/Space Physics & Astronomy, *6100 Main, Houston, Texas* 77001 (C-540)

Theoretical calculations have been performed of rates and cross sections for a number of collision processes involving molecules, atoms, and electrons in gases and near metal surfaces. These rates are important in the kinetic modeling of laser media and high- and low-temperature plasmas. The theoretical studies include: vibrational and rotational energy-transfer in electron-CO2 collisions; determination of the effects of plasma screening on inelastic electron-ion scattering in high-temperature, high-density plasmas; extension of charge-transfer studies in He ions collisions with atomic hydrogen to include 'continuum' correlation effects; energy transfer in collisions of excited atoms and molecules with metal surfaces; energy transfer in slow collisions of exited- and ground-state rare-gas atoms; self-consistent LCAO/MO (local exchange) calculation of energies and wave functions for H in a nickel crystal. A new theoretical program has been initiated to study: (1) inner-shell photoionization of large molecules by a hybrid R-Matrix/Multi-Scattering approach, and (2) electronic excitation of molecules (and molecular crystals) by 'Super-thermal' neutron scattering.

SUPPORTED BY Robert A. Welch Foundation

8.0045, ROCKET-BORNE STUDY OF AURORAL ELECTRIC FIELDS AND CURRENTS

E.A. Bering, University of Houston, School of Natural Sciences & Mathematics, Dept. of Physics, *3801 Cullen Blvd., Houston, Texas* 77004 (ATM77-21462 A01)

Data on the electrodynamic structure of the aurora borealis taken during the flight of sounding rocket Terrier-Malemute 29.007 UEX will be analyzed. The data include measurements of the DC electric field, AC electric field, plasma density and plasma temperature. Correlations and comparisons will be made with a variety of data from other instruments on the rocket and from ground based sources. The rocket trajectory carried over an auroral arc and, thus, good data was obtained on an important auroral form. The overall aim of the research is to deduce the particle behavior, current density on electro-magnetic fields associated with the arc.

SUPPORTED BY U.S. National Science Foundation,
Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Atmospheric Sciences

8.0046, CONJUGATE MAGNETOSPHERIC ELECTRIC FIELDS, MAGNETOSPHERIC ULF RADIATION, AND MODULATIONS OF ELECTRON PRECIPITATION (ABBREV)

E.A. Bering, University of Houston, School of Natural Sciences & Mathematics, Dept. of Physics, *3801 Cullen Blvd., Houston, Texas* 77004 (DPP79-09236)

Five electric field detectors will be constructed and added to the University of Maryland's X-ray balloon payloads planned for flight from Siple Station, Antarctica, in January 1980 to study interactions of very-low-frequency and ultra-low-frequency waves with particles in the magnetosphere.

The data obtained by the electric field detectors on these flights will be used to investigate the interaction between energetic electron precipitation and ultra-low-frequency waves.

SUPPORTED BY U.S. National Science Foundation,
Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Polar Programs

8.0047, THEORETICAL INVESTIGATION OF INVERSION LAYERS IN METAL-OXIDE-SEMICONDUCTOR INTERFACES 15873-P

C.S. Ting, University of Houston, School of Natural Sciences & Mathematics, Dept. of Physics, *3801 Cullen Blvd., Houston, Texas* 77004 (DAÓG9030; DAAG29-79-C-0039)

To study the subband energy levels of the metal-oxide-semiconductor interface Auger-type transitions affecting infrared optical absorption involving these levels, their temperature dependence, the consequences of intervalley electron-electron scattering on electron mobility, and the dependence of effective quasi-particle electron mass on the density of sodium ions drifted to the interface as evidenced by cyclotron resonance. Relevance - improved understanding of these interfaces found in field-effect transistors widely used in military and industrial devices has the potential of significantly impacting the future of semiconductor device technology.

The Green's function method of many-body theoretical physics will be used, particularly involving the random phase approximation and the memory-function formalism.

8.0048, HIGH-PRESSURE PHASES OF COPPER CHLORIDE AND HIGH TRANSITION TEMPERATURE SUPERCONDUCTORS

C. Chu, University of Houston, School of Pharmacy, Dept. of Physics, *3801 Cullen Blvd., Houston, Texas* 77004 (DMR79-08486)

This research is a continuation and extension of work supported under NSF grant No. DMR-7723204. A broadly based experimental program involving the use of ultra-high pressures and low temperatures will investigate the electrical, magnetic, thermal, optical and superconducting properties of a variety of alloys and compounds. Initial efforts will concentrate on a detailed study of the high pressure phase of copper chloride. Concomitant with this work, will be a study of the effect of ultra-high pressures on the magnetic properties of metallic elements and compounds as well as on the ternary molybdenum chalcogenides.

First year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation,
Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0049, ANOMALOUS SOUND PROPAGATION IN METALS

J.D. Gavenda, University of Texas, Austin Campus, School of Natural Sciences, Dept. of Physics, *200 W. 21st St., Austin, Texas* 78712 (DMR78-25232)

The recently discovered phenomenon of anomalous sound propagation in copper by conduction electrons in extended orbits will be studied by measurements with various geometries of ultrasonic wave vector and polarization. The dependence of

this phenomenon on the properties of the Fermi electrons in different metals will be investigated and a quantitative theoretical model will be developed on the basis of the experimental results. Phases of the project will include: 1. the determination of the validity of pulsed-ultrasonic experimental data in the presence of extended-orbit resonances, 2. a better understanding of the mechanisms involved in direct generation of ultrasound by electromagnetic fields, 3. the reduction of ambiguity in the interpretation of magnetoacoustic data, 4. the possible explanation of anomalous microwave propagation by open-orbit electrons, and 5. the possibility of ultrasonic amplification through coupled extended-orbit resonances. This is the first year of a three-year continuing grant.

8.0050, TOPICS IN THEORETICAL PHYSICS

C.E. Carlson, College of William & Mary, Williamsburg College, School of Arts & Sciences, Dept. of Physics, *Ewell Hall, Williamsburg, Virginia* 23185 (PHY79-08240)

Research will be done in theoretical physics to enhance our understanding of elementary particles and of the nucleon-nucleon interaction in nuclear physics.

The theoretical problems to be investigated concern the hadronic production of charmed particles, extraction of Gen from elastic e-d scattering data, calculation of the long range nucleon-nucleon interaction from quark confinement models, and determination of the sign of the NN interaction at short distances.

This is the first two years of a four-year continuing grant, previously supported under NSF grant PHY77-07409.

SUPPORTED BY U.S. National Science Foundation,
Directorate for Mathematical & Physical Sciences, Div. of Physics

8.0051, THEORETICAL MEDIUM ENERGY NUCLEAR PHYSICS

J.V. Noble, University of Virginia, School of Arts & Sciences, Dept. of Physics, *Garrett Hall, Charlottesville, Virginia* 22903 (PHY79-01672)

This work is in the field of theoretical physics, with particular emphasis on study of nuclear interactions. Specific topics which will be examined include: 1) Implications of wave function orthogonality for improved DWBA calculations. 2) Relativistic effects in medium energy reactions. 3) Characterization of nuclear collective motions in terms of coupled meson and nucleon fields. 4) Relativistic three body dynamics. 5) Measurement of the mesonic component of nuclei.

This is the first year of a three year continuing grant, previously supported under NSF grant PHY76-84374A01.

SUPPORTED BY U.S. National Science Foundation,

SOCIAL SCIENCES

Includes Social Sciences (general); Administration and Management; Documentation and Information Science; Economics and Cost Analysis; Law and Political Science; and Urban Technology and Transportation.

9.0001, LANDSAT STUDY OF URBAN CHANGE IN JACKSON, MISSISSIPPI

M. Lang, Jackson State University, School of Liberal Studies, Dept. of Social Science & Educational Geography, *1325 Lynch St., Jackson, Mississippi* 39217 (NSG 736)

This project has three components: 1) Applied research utilizing Landsat data for monitoring, assessment and analysis of changing land use patterns along an interstate highway beltway in Jackson, Mississippi. 2) Development of Landsat data analysis capabilities at Jackson State University. 3) Establishment of research ties among geographers at predominantly minority institutions to encourage the use of Landsat data in research and instruction at their respective college or university.

PROGRESS/CURRENT PLANS: Planning and initial efforts are underway in the research phase of this project. Landsat imagery of the study area, collected during 1976 and 1978, has been obtained and analysis has begun. Field studies to be used for verification of the Landsat data have been initiated. Finally, efforts are underway to augment existing central computing facilities at Jackson State University to allow for analysis of digital Landsat data.

During October 1979 a workshop was held at Jackson State University. The purpose of the workshop was to bring together geographers from predominantly minority institutions to discuss ways of improving geography programs at these universities. Participants outlined research topics which could be undertaken jointly. These included: 1) Geographic and social impacts of community development efforts in major urban areas of the South. 2) Economic impact of loss of black owned farmland in the South - using Landsat data. 3) Changing ethnic residential patterns in major cities of the South.

9.0002, STUDY OF GENERALIST VERSUS SPECIALIST CONCEPT IN PERSONNEL MANAGEMENT

C. Sampson, State University & Community College System of Tennessee, Tennessee State University, School of Arts & Sciences, Dept. of Political Science, *Nashville, Tennessee* 37203 (NAS 9-15862)

Effective personnel administration, i.e., the procurement, development, and utilization of an organization's human resources is the key to successful management. Regardless of what product or service an organization provides and no matter what size, age, or location, it must procure human resources to remain viable. Further, if the organization is to survive, it must design programs to develop human resources to their fullest capacities and maintain ongoing worker commitment.

The practice of personnel administration faces three general demands. First, it must help the organization cope with a changing environment, with constraints and opportunities developed externally, such as those stemming from public law and labor unions. Second, it must cooperate with other line and staff areas to achieve the organization's goals. It must secure the respect, trust, and confidence of the members of these units in order to effectively implement its programs. Third, it is required to respond to certain serious human resource management problems organizations face.

This study will examine all areas considered in a 1968 study of the JSC personnel organization, and will compare JSC with other agencies. It will examine the role of the Personnel Management Specialist in contemporary generalist and specialist operations. These two approaches will be compared and contrasted, and their relevance to JSC will be analyzed. Included in the report will be a discussion of the impact of the revamping of the Civil Service Commission.

SUPPORTED BY U.S. National Aeronautics & Space Admin., Lyndon B. Johnson Space Center

9.0003, SPACE FLIGHT DESIGN AND DEVELOPMENT STUDIES

H.E. Blackwell, Texas Southern University, School of Arts & Sciences, Dept. of Physics, *3201 Wheeler Ave., Houston, Texas* 77004 (NAS 9-16054)

The contract includes work in two areas. Initially, effort will be concentrated on the review, criticism, testing as re-

quired, and preparation of course material for training of flight design paraprofessionals. The course materials will be developed from initial materals prepared at JSC. Periodic reviews will be scheduled for the purpose of discussing progress and problems. The goal is a modular set of instructions incorporating innovative educational techniques which can be used with minimum preparation time by the instructor, and which will insure consistent training for all students.

The second phase will be preliminary development of a remote manipulator arm real-time simulator. TSU will review engineering data and algorithms, devise improved algorithms if required, and implement these algorithms into a university computer facility. Technical exchanges and reviews will be scheduled on a regular basis. The long-range goal is a system which could be used for training and flight design.

SUPPORTED BY U.S. National Aeronautics & Space Admin., Lyndon B. Johnson Space Center

9.0004, AN EVALUATION OF THE LANGLEY LEARNING CENTER

A.E. Boese, Virginia State College, Graduate School, Dept. of Economics, *Petersburg, Virginia* 23806 (NAS 1-16079)

N.A.S.A.-Langley has established a Learning Center as an alternative educational method to supplement its employee training efforts. This method of training offers employees individualized learning in those instances where it appears to be more convenient, meaningful, and cost effective.

The objective of Virginia State University's contract with N.A.S.A. is to evaluate the effectiveness of the training function of the Learning Center. This evaluation will be made possible through four related projects: (1) The development and validation of a means of surveying the job related training needs of the Langley Research Center. (2) The development and validation of a means of evaluating the learning experience of Learning Center participants. (3) The development and validation of a means of surveying employee satisfaction with the Learning Center. (4) The development and validation of a method of evaluating the value of the Learning Center in relation to the total Research Center.

The study is intended to eventually help increase the effectiveness of the Learning Center, and the productivity of the participants and the Research Center.

10.0001, USE OF THE CHAPPUIS BAND FOR DETERMINATION OF MODERN AND HISTORICAL STRATOSPHERIC OZONE LEVELS

R.J. Angione, California State University & Colleges, San Diego State University, School of Sciences, Dept. of Astronomy, *5402 College Ave., San Diego, California* 92115 (NSG 1430)

A program is underway to optimize observations and data reduction techniques to use absorption of sunlight by the Chappuis band for the determination of contemporary and historical amounts of ozone in the earth's stratosphere. Observations made by the Smithsonian Institution's Astrophysical Observatory during the period from 1905 to 1955 are being analyzed to produce long-term baselines for Table Mountain, California, and Mount Montezuma, Chile. Shorter length baselines will be determined for seven other sites in North and South America and Africa. Ozone amounts will be reported on an absolute scale that is independent of, but comparable with, results from Dobson spectrophometry. Modern observations in the wavelength range 0.40 to 0.95 microns are being made of the sun during the daytime with a filter wheel radiometer and of bright stars at night with an existing astronomical telescope and photometer.

The filter wheel radiometer was taken to Mauna Loa Observatory and intercompared with the Dobson. The Chappuis band results were systematically lower by 0.17%. To date we have baseline ozone measurements from 1920 to 1950 for Table Mountain, California, and Mount Montezuma, Chile.

SUPPORTED BY U.S. National Aeronautics & Space Admin., Langley Research Center

10.0002, THEORETICAL STUDIES OF SOLAR WIND DYNAMICS

T. Kilpatrick, California State University & Colleges, San Francisco State University, School of Science, Dept. of Physics & Astronomy, *1600 Holloway Ave., San Francisco, California* 94132 (NCA 2-660806)

The hot outer atmosphere of the sun expands supersonically into interplanetary space. This hydrodynamic flow, called the solar wind, streams past Earth causing such effects as the northern and southern lights, magnetic storms, and perhaps influencing the weather on the Earth. However, the physical mechanisms which act to heat and accelerate high-speed streams in the wind have not been clearly elucidated. Hydromagnetic waves can transfer momentum to the wind, and large fluxes have been observed in high-speed streams by spacecraft borne instruments. The proposed research will examine the role that hydromagnetic waves play in the acceleration and heating of the solar wind. The results of these investigations will be reported in published papers.

10.0003, IRRADIATION EFFECTS ON SURFACE OF THE MOON, MERCURY, ASTEROIDS & OTHER AIRLESS SOLAR SYSTEM BODIES DUE TO SOLAR HIGH ENERGY & COSMIC RAYS

M.S. Spergel, City University of New York, York College, Undergraduate School, Dept. of Physics, *150-14 Jamaica Ave., Jamaica, New York* 11432 (NSG 7454)

Under study is both the feasibility of determining planetary composition by remote sensing of galactic cosmic ray induced gamma rays and the prediction of rare earth abundances within the lunar soil. Investigations of secondary neutrons induced in the lunar soil and in planetary and cometary soils have indicated that the energy spectra of the neutrons and their secondary gamma rays are determined principally by the soil composition.

Various production mechanisms for the induced neutrons were considered. The neutron flux is then calculated using a 100 energy group neutron transport code. The calculations are carried out in collaboration with Drs. P.W. Levy and O.W. Lazareth of Brookhaven National Laboratories and utilize recent neutron and gamma ray cross sections. The calculations were performed assuming isotopic and anisotopic neutron scattering.

The gamma ray fluxes were calculated from the neutron flux distributions generated by the galactic cosmic rays primaries. The gamma ray fluxes use a transport code.

It would appear that galactic cosmic ray fluxes will produce a gamma ray flux at the surface that is measurable by 'state of the art' instrumentation. In fact, if values of 10 minus to the 6th power ph/sq. cm Mev sec Str are measurable, it should be possible to measure the induced gamma rays out to 30 lunar radii from a surface.

Soil composition, rather than the characteristics of the secondaries appear to be the dominant factor shaping the gamma energy flux. The prompt gamma ray energy spectrum appears to contain prominent maxima indicative of certain nuclei. Thus, the prompt gamma ray flux measurements may provide a practical technique for determining soil composition in fly-by missions.

The study is continuing to examine the variation of secondary flux for compositional variation.

10.0004, THEORETICAL PROBLEMS OF SPIRAL GALAXIES

C. Yuan, City University of New York, City College, Graduate School, *Convent Ave. & 138th St., New York, New York* 10031 (NSG 2348)

The density-wave-theory has proven to be the most successful theory of explaining the spiral structure of disc galaxies. One objective of the present research is to further strengthen the theory by solving the eigen-value problem recently formulated by Lin and Lau to find spiral modes of density waves. The short-range goal is to develop a numerical method which is capable of calculating eigen-values and modes for a large class of galactic models. In particular, we are interested in confirming the asymptotic theory put forward by Lin and Lau and obtaining the spiral modes for the Milky Way. The long-range goal of this study is to establish a dynamical classification of spiral galaxies. The problems of discretizing the singular integral equation of the Poisson's type and treating the radiation boundary condition at infinity are resolved. We are in the process of establishing methods to search the eigen-values of a complex algebraic system.

The second objective of the research is to study the evolution of the abundance distribution of the gas in spiral galaxies, especially for galaxies like the Milky Way which has an inner Lindblad resonance. The gas will redistribute itself in the course of time as it is continuously depleted into star formation by the triggering mechanism of the large-scale shock along spiral arms. We shall use the Godunov Method to solve the gas dynamics equations with the mass loss derived from the density-wave theory. The first order numerical scheme which can handle the geometric singularity at the center and the source terms is being developed. Our immediate aim is to obtain the time-dependent axisymmetric solution. However, we intend to extend the problem to two dimensions in the future.

10.0005, THEORETICAL STUDIES OF AURORAL AND MAGNETOSPHERIC PHENOMENA

D.W. Swift, University of Alaska, Fairbanks Campus, Geophysical Inst., *Fairbanks, Alaska* 99701 (ATM77-14897 A01)

This grant will support a broad range of theoretical studies directed toward answering fundamental questions about the auroral magnetospheric substorm and the mechanisms of energy flow from the solar wind to the aurora. The work will consist of an interplay of analytical studies and numerical modelling of plasma processes.

Specific projects planned are: 1. an investigation of the mechanism for the development of large localized potential differences across magnetospheric field lines; 2. an investigation of energy transfer processes through the northern and southern boundaries of the magnetospheric tail; 3. an improved V-shock model to calculate perpendicular energization of oxygen ions; and 4. an investigation of wave-particle diffusion processes in auroral electron beams.

SUPPORTED BY U.S. National Science Foundation, Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Atmospheric Sciences

10.0006, PLANETARY GEOSCIENCE CONSORTIUM

L.A. Soderblom, U.S. Dept. of the Interior, Geological Survey, Branch of Astrogeologic Studies, *601 E. Cedar Ave., Flagstaff, Arizona* 86001 (9580-01327)

Although the primary emphasis is shifting away from lunar studies to other planets, two lunar activities will continue. First, Wilhelms will complete his two-year effort to compile a new map of the maria based on all available consortium data and second, phase-angle-color studies by Soderblom will be finished. The prime emphasis will be to collect and reduce a variety of Mercury and Mars data coming available (crater density, color variation, geology, for both; IRTm, MAUD, geomorphic and structural maps, gravity and others for Mars). Additionally, pilot studies will begin late in FY 79 for reduction, portrayal and correlation of Venus Pioneer and Voyager data.

SUPPORTED BY U.S. Dept. of the Interior, Geological Survey, Geologic Div.

10.0007, SEARCH FOR LOW MASS COMPANIONS OF SOLAR-TYPE STARS USING A FABRY-PEROT SPECTROMETER

K.M. Serkowski, University of Arizona, Lunar & Planetary Lab., Dept. of Planetary Sciences, *Tucson, Arizona* 85721 (AST78-23107)

Since August 1977 an echelle spectrometer with a Fabry-Perot wavelength calibration has been in operation on the Catalina 154-cm telescope. It has measured stellar radial velocities with accuracy of about plus or minus 30m/sec, considerably higher than conventional instruments. The instrument is used for a search for low-mass (0.001 to 0.1 solar mass) companions around solar-type stars. The purpose of this search is to detect the Jupiter-like planets and to estimate the frequency of single stars among solar-type stars, essential for estimating the frequency of extrasolar planetary systems and for explaining the origin of the solar system.

It is planned to include in the search all those 52 solar-type stars brighter than V equals 5.5 mag. for which Abt and Levy did not find evidence of duplicity or multiplicity. The present Digicon detector will be replaced by a 342 x 42 element intensified CID array, permitting observations of 9 echelle orders simultaneously and therefore increasing the limiting magnitude of the radial velocity meter to V equals 6.0 mag. A laser calibration will be installed which should increase the accuracy of the radial velocities to above plus or minus 15m/sec for a single observation.

10.0008, SPECTROSCOPIC STUDIES OF QUASISTELLAR OBJECTS

P.A. Strittmatter, University of Arizona, School of Liberal Arts, Dept. of Astronomy, *Tucson, Arizona* 85721 (AST77-23055 A01)

A wide variety of projects have been investigated in order to understand the nature of the line-formation regions in quasistellar objects (QSO's). In the past years discoveries have been made that certain absortion systems with redshifts both greater and much less than the emission redshift must originate at distances so far from QSO's that the absorbing material cannot be directly associated with the quasar. In addition, the results of studies of absorption in low-redshift QSO's are consistent with the redshifts originating in intervening galaxies. Certain Seyfert galaxies and HII regions have been studied and interesting discoveries concerning the nature of the continuum radiation from the nucleus of the galaxy NGC 1068 and the hot star lambda Ori A were made.

The spectroscopic work on low-z QSO's will be continued for the next two years in order to find absorption systems that may arise in intervening galaxies which can be directly photographed in the red region of the spectrum and studied spectroscopically. Absorption systems in high-z quasars will also be observed at high resolution in order to determine element abundances and whether line-splitting is caused by radiation pressure ('line-locking'). Emission-line regions will be modeled theoretically in order to determine whether the line profiles can be accounted for in terms of radiation pressure. Finally, low-dispersion work on the identification of Molonglo sources will be continued, as well as the initiation of a new discovery program of radio-quiet high-redshift QSO's using a converging beam transmission grating. This is a continuation of grant AST 76-22991.

10.0009, OBSERVATIONAL PROGRAM IN GROUND-BASED INFRARED ASTRONOMY

G. Neugebauer, California Inst. of Technology, Graduate School, Dept. of Physics Mathematics & Astronomy, *1201 E. California Blvd., Pasadena, California* 91109 (AST77-20516 A01)

An infrared astronomy program using the telescopes of the Hale Observatories will be carried out. The program emphasizes the unique capabilities of the 200 inch telescope--high spatial

resolution with high signal-to-noise--combined with high-sensitivity photometric equipment developed over the past years. Highest priority will be put on high spatial resolution studies of galactic nuclei and point sources using the 200 inch; this can determine size structure with an uncertainty of approximately 0.1". An increasing emphasis is being placed on high spatial resolution, medium spectral resolution spectroscopy. The telescopes at Las Campanas, Chile, and Mauna Kea, Hawaii, will also be used.

The specific scientific programs which will be emphasized include the continuation of the study of molecular hydrogen with high spatial resolution. The systematic study of the infrared energy distributions of quasars will be continued along with low-resolution spectroscopy to identify atomic lines which are redshifted into the near infrared in comparison with lines which are redshifted into the visible. Several extragalactic and galactic ionized hydrogen (H II) regions will be studied in addition to the observations of regions of star formation within the Galaxy.

This is a continuation of research begun under NSF grant AST 74-18555 A2.

10.0010, LABORATORY STUDY OF NEUTRAL POINT SOLAR FLARE PROCESSES

R.S. White, University of California, Riverside Campus, Inst. of Geophysics & Planetary Physics, *Riverside, California* 92502 (ATM76-23463 A02)

The primary objective of this grant is the experimental investigation of the dynamic behavior of plasmas in the neighborhood of an x-type magnetic neutral point, and the process of reconnection of magnetic field lines. The purpose of this effort is to clarify the physical processes that take place in solar flares, substorms of the earth's magnetosphere, and other manifestations of plasma dynamic behavior and field line reconnection in complex magnetic field systems containing x-type magnetic neutral points.

The investigators will study magnetic field line reconnection with a flat plate Double Inverse Pinch Device (Mark IV) and three-dimensional, double-dipole configurations. They measure the fluxes and energy spectra of accelerated ions and electrons, optical, microwave, and X-ray radiations, the magnetic field line configurations, reconnection rates, and energy dissipation rates. A major effort will be made to determine the conditions required to produce the remarkable transitions from ohmic to turbulent conductivity which have been observed. These sudden conduction mode transitions produce many phenomena that correspond to those in solar flares and magnetospheric substorms.

The overall aim of this work is to understand the process of magnetic reconnection and how it relates to realistic models of the solar flare and the magnetosphere substorm.

10.0011, AN INVESTIGATION OF MAGNETIC FIELDS IN PROMINENCES AND FLARES

J.M. Malville, University of Colorado, Boulder Campus, School of Arts & Sciences, Dept. of Astro Geophysics, *1200 University Ave., Boulder, Colorado* 80302 (ATM78-25059)

This grant will support an investigation of the role of magnetic fields in solar prominences and flares based largely upon data obtained with the Kitt Peak National Observatory (KPNO) magnetograph. Observational material which has already been obtained includes helium line magnetograms of disk filaments and hydrogen line magnetograms of limb prominences, both with spatial resolution approaching one second of arc. Major themes of the study will be the association between velocity fields and magnetic fields, electric current systems in the low corona, and the development of flare-like current sheets in prominences. New observations are measurements of magnetic fields in limb flares and high time resolution studies of flare-like events in prominences. The overall aim is to understand the magnetic/electric character of solar activity.

10.0012, INSTRUMENT FOR LONG DURATION OBSERVATIONS OF SOLAR P-MODE OSCILLATIONS

R.F. Howard, Carnegie Inst. of Washington, *1530 P St. N.W., Washington, District of Columbia* 20005 (AST78-20404)

This grant will support the purchase of data reduction and analysis equipment to be used in a program of seismic probing of the structure of the sun. Specifically, the motions of the surface of the sun will be measured on a regular basis in order to derive the variations with time of the rate of rotation of the surface and subsurface layers of the sun. In addition to studying solar rotation these observations will permit an investigation of other aspects of solar velocity fields such as possible acoustic oscillations generated by solar flares, meridional flows and variations in frequency and amplitude of the newly discovered p-mode oscillations. Such observations will improve our knowledge of how solar variations affect our terrestrial environment.

The equipment will be used in conjunction with the 60-foot solar telescope on Mt. Wilson with which the five minute oscillations of the sun were originally discovered. Practically all the observing time available on this instrument will be dedicated to this program. Large blocks of observing time are necessary to the success of the project. The proposed data acquisition and analysis system will have the necessary speed and capability to collect and store large amounts of data and to carry out the required data reduction tasks which are central to this project.

10.0013, OBSERVATIONAL STUDIES OF THE ATMOSPHERES OF EARLY-TYPE STARS

S.C. Wolff, University of Hawaii System, Manoa Campus, School of Arts & Sciences, Dept. of Astronomy & Physics, *2444 Dole St., Honolulu, Hawaii* 96822 (AST77-27404 A01)

The analyses of the spectra of early type stars are essential to studies of galactic structure, interstellar matter, stellar nucleosynthesis and evolution. Within the last decade our understanding of atmospheric structure and line formation processes has reached the point where it appears possible to use the observed spectra to obtain reliable diagnostics of the conditions prevailing in the atmospheres of these early stars. This research will be devoted to carrying out an observational program designed to provide photoelectric measurements at high resolution of the spectrum of such stars. A study of the line profiles due to elements such as hydrogen, helium and carbon will be made in order to test the model atmosphere calculations, to provide data which will be used as an input for further improvements in the theoretical models, and to take advantage of the calculations already made to determine atmospheric parameters, rotational velocities, and helium abundances for early type stars.

This is a continuation of work originally supported under NSF grant AST77 27404.

10.0014, POSITIONAL STUDIES OF MINOR PLANETS

H.J. Wood, Indiana University, Bloomington Campus, Graduate School, *2805 E. 10th, Bloomington, Indiana* 47401 (AST79-08911)

Support is to continue a long-term scientific service project for positional and magnitude measurements of minor planets down to the 17th magnitude. In the program, 6,300 astrographic plates were accumulated using a 25cm astrograph during the period 1948-1966. Presently, positions are being measured on re-

quest for those objects which need orbit improvements to facilitate modern astrophysical observation or for those objects which may become 'critical', in danger of being lost because of poorly-known orbital elements. The Indiana Minor Planet Center responds to requests for astrometric positional measurements from scientists all over the globe. Dr. Brian Marsden at the Smithsonian Astrophysical Observatory, who coordinates the activities of several observatories through the International Minor Planet Center is the major user of astrometric positions of minor planets measured at Indiana. In addition, Dr. Paul Herget has developed a new program at Cincinnati to find newly discovered minor planets on plates where they were missed earlier. Professor Herget's program is a new source of requests for blinking and measurement on the astrographic plates. Indiana has the largest asteroid plate collection in the United States and thus provides a valuable service to groups active in minor planet research.

10.0015, CONTINUED SURVEYS FOR EMISSION LINE OBJECTS

T.J. Bohuski, Western Kentucky University, School of Science & Technology, Dept. of Physics & Astronomy, *Bowling Green, Kentucky* 42101 (AST78-01375)

The first part of the project will be a survey of emission line galaxies in the Hydra I and Centaurus clusters in an attempt to determine the luminosity function of such objects down to an absolute magnitude of M equals minus 13. Since many emission line galaxies appear to be experiencing a high rate of star formation, such data is useful for studying the time-dependence of the star formation rate within galaxies. The purpose of part two of this project is to examine the question of how the discovery rate of quasars depends on differences in the observers, the equipment used, and the identification criteria. Substantial variations in the discovery rate do appear to exist and understanding of why they do is necessary to a proper interpretation of quasar statistics. An objective prism survey of a region that is being surveyed independently by another group of observers will be carried out to find out how the discovery rate of quasars depends on the equipment used and other factors.

10.0017, THE GALACTIC DISTRIBUTION OF INTERSTELLAR ABSORPTION

R.J. Davis, Smithsonian Institution, Astrophysical Observatory, Optical & Infrared Div, *60 Garden St., Cambridge, Massachusetts* 02138 (310-4050-05)

OBJECTIVE: Obtain an improved determination of the galactic distribution of interstellar dust, and of variations in its extinction properties, in the wavelength range 1300 to 6000 angstroms.

SECONDARY OBJECTIVE: To complete the identification of stars having peculiar photometric properties in the above wavelength range, based on UBV, H-beta, and the Celescope ultraviolet photometry.

APPROACH: Obtain UBV and H-beta photometry for all stars in the Celescope catalog not already having UBV photometry, using telescopes and photometric equipment at Kitt Peak National Observatory (Davis) and at Cerro Tololo Inter-American Observatory (Deutschman and Schild). Determine variations in the interstellar extinction as a function of distance and galactic longitude and latitude for all stars in the Celescope catalog.

PROGRESS: Observations, data reduction, and preliminary data analysis are complete. We are preparing a paper for publication, most probably in the Astrophysical Journal Supplement Series.

10.0018, ACQUISITION OF EQUIPMENT FOR HELIUM LIQUEFIER AND RECOVERY SYSTEM

A.M. Goldman, University of Minnesota, Minneapolis Campus, School of Liberal Arts, Dept. of Physics & Astronomy, *322 Johnston Hall, Minneapolis, Minnesota* 55455 (DMR7810902)

A helium liquefier and gas recovery system will be purchased and installed to provide liquid helium for the scientific community at the University of Minnesota as well as for an off-campus institute, the Freshwater Biological Institute. Research requiring the use of liquid helium is carried out in a number of departments of the Institute of Technology and of the College of Biological Sciences. The most active areas of research are condensed matter physics, biochemistry, infrared astronomy, upper atmospheric physics and geomagnetism. Gas recovery will be expanded to include all participating laboratories.

SUPPORTED BY U.S. National Science Foundation, Div. of
Materials Research

10.0019, EQUIPMENT ACQUISITION - FRAPAS

J.A. Lockwood, University System of New Hampshire, University of New Hampshire, School of Liberal Arts, Dept. of Physics, *Durham, New Hampshire* 03824 (ATM79-10543)

This grant will permit the acquisition of a Flight Readiness and Preliminary Analysis Support System (FRAPAS) for the neutron and gamma-ray balloon program at the University of New Hampshire. This system, consisting of such elements as a dual floppy disk, static and dynamic RAMS, terminals, tape transport, and a DEC writer, will enable diagnostic tests to be made on the balloon flight system. Complete system checks and calibrations can be made quickly. Real-time displays of all data can also be made.

A flexible ground support system is needed for the UNH neutron and gamma-ray detector systems because of the extreme complexity of the data acquired. The cosmic-ray isotope and electron measurements of Webber will also use this system. A frame of 18-4 bit words must be processed, two-dimensional matrices analyzed, and extensive checks made to ensure that the system is operating properly. The system will be used primarily with the UNH time-of-flight neutron and gamma-ray detector capable of measuring the fluxes, energy spectra, and angular distributions of neutrons and gamma-rays in the energy intervals from 2 MeV to 60 MeV and 0.5 MeV to 10 MeV respectively. The proposed balloon flights with this detector and the FRAPAS system will attempt to set limits on the diffuse cosmic gamma-ray flux from 0.5 MeV to 3 MeV, and determine the angular distributions and energy spectra of atmospheric neutrons from 3-60 MeV.

10.0021, PHYSICAL NATURE OF COMETS

A.H. Delsemme, University of Toledo, School of Arts & Sciences, Dept. of Physics & Astronomy, *2801 W. Bancroft St., Toledo, Ohio* 43606 (AST79-14789)

The program of establishing brightness profiles in the monochromatic light of different molecular, ionic and atomic emissions in comets will be continued. In particular, numerous brightness profiles will be established for Comet West, as a function of its heliocentric distance, from a sequence of spectrograms previously obtained in Toledo. The brightness profiles will be measured in two directions, sunwards and antisunwards. The program will be further developed from spectrograms, obtained either from ground-based observatories (in Toledo or elsewhere) for the major ions (like H, O or CO) and radicals (like CN or C) or to be obtained from space with the international Ultraviolet Explorer, (mainly for H, C and O) should a bright comet appear. This approach has provided the only direct observation known so far for the plasma behavior ahead of a comet, and will yield, therefore, a better understanding of its interaction with the solar wind. It will also coniderably diminish one of the major uncertainties in the measure of the vaporization rate of different gases from the cometary nucleus, and will be therefore an important step towards understanding their mysterious chemisty. Theoretical studies linking hypotheses of cometary origin to their chemical and physical nature will also be undertaken.

Prior support was by NSF grant AST 76-07116A01.

10.0022, A LONG-RANGE NEUTRINO DETECTOR

K. Lande, University of Pennsylvania, School of Arts & Sciences, Dept. of Physics, *34th & Spruce Sts., Philadelphia, Pennsylvania* 19104 (AST79-08670)

This project will involve support of an experiment for the detection of neutrino and antineutrino bursts emitted by a star as it becomes a supernova. The creation of the supernova involves very large amounts of energy which must be radiated away from the star and much of this energy can be carried by neutrinos. The detection of neutrinos from a supernova explosion will enable one to determine the physical conditions near the center of the star at the onset of the explosion.

The detector will also be able to detect high energy neutrinos from localized stellar sources. One will be able to determine if neutrino oscillations occur for neutrino transits of the earth. The detector will also measure the characteristics of very high energy muons produced by the interaction of cosmic ray primaries in the upper atmosphere. Limits on the lifetime of nucleons such as the proton will also be determined.

10.0023, THE ALLEGHENY OBSERVATORY TRIGONOMETRIC PARALLAX PROGRAM

G.D. Gatewood, University of Pittsburgh, School of Arts & Sciences, Dept. of Physics & Astronomy, *4200 5th Ave., Pittsburgh, Pennsylvania* 15260 (AST75-02641 A03)

Precision measurement of the parallactic shift for the nearby stars as the earth circles about the sun furnishes the important result of the star's distance and hence its true brightness. Continuation of such measures also reveals the star's motion through space. In addition, for binary stars the stellar masses are determined in favorable cases. These parameters are important results for the physics of the stars.

The Pittsburgh group will continue parallax observations for stars of general interest, brighter than magnitude 16 and north of -20 degrees declination, thought to be within 65 light years of the sun, also some stars of greater distance but of special interest, including those of the Hyades cluster, in an international campaign. In addition, a number of visual and astrometric binaries will be continued under long-term observation. The many requests expected from other astronomers will be processed as rapidly as possible. Further study of ways of improving the precision of observation and reduction will be emphasized. Observations will be made with the Thaw refractor at Pittsburgh and with the 88-inch reflector at high altitude at the Mauna Kea Observatory of the University of Hawaii.

Prior support was by NSF grant AST 75-02641 A01.

10.0024, THE OBSERVATION AND ANALYSIS OF RESULTS FROM THE 16 FEBRUARY 1980 TOTAL SOLAR ECLIPSE - INITIAL PHASE

J.L. Streete, Southwestern at Memphis, Undergraduate School, Dept. of Physcis, *2000 North Pkwy., Memphis, Tennessee* 38112 (ATM79-16235)

Southwestern at Memphis and the High Altitude Observatory (HAO) of the National Center for Atmospheric Research will jointly carry out observations and analysis of the brightness and polarization of the solar corona for the total solar eclipse of 16 February 1980. The results obtained from this program are directed toward a number of specific goals, in addition to their contribution to synoptic studies of the corona: (a) the verification of the in-flight radiance and polarization calibration of the HAO Coronagraph/Polarimeter on the Solar Maximum Mission (SMM); (b) the determination, with high reliability, of the optical parameters of that orbiting instrument; (c) the cross calibration between the SMM instrument and the ground-based HAO Mark III K-Coronameter instrument at Mauna Loa, Hawaii; and (d) the cross calibration with the joint Harvard/HAO Lyman-alpha/White Light Coronagraph Rocket Flight, and other Lyman-alpha rocket coronal observations to be carried out during or near the period of totality.

The main scientific objective is to further our understanding of coronal properties.

10.0025, JOINT U.S.-FRANCE PROGRAM OF INTERSTELLAR MOLECULAR SPECTROSCOPY

P.A. Vanden Bout, University of Texas, Austin Campus, Graduate School, Dept. of Astronomy, *200 W. 21st, Austin, Texas* 78712 (INT78-21382)

This award provides for the support of research in the field of galactic radio astronomy. The objective of the joint research is to make spectral line observations of star-forming interstellar molecular clouds. These observations are aimed at elucidating the conditions which led to star formation.

The two groups will study the physical properties of galactic molecular clouds. The research will center on the determination of the physical conditions in clouds where star formation has occurred or is occurring now, i.e., the densities, temperatures and velocities of the gas and dust, what factors have trig-

gered the onset of star formation and what is the energy balance. To accomplish that goal radio and infra-red data at several wavelengths will be collected. The mm wavelength radio data will be taken on the Texas antenna. The other radio and infra-red data will be obtained at a combination of U.S., French and other European observatories. In addition, the French will provide the U.S. group with a Carcinotron (alternative local oscillator capable of multiplication to higher frequencies i.e., greater than 150 GHz. This device will be installed at the Texas antenna.

This project is under the auspices of the U.S.-France Cooperative Science Program and provides for cooperation between scientists at the University of Texas at Austin and the Meudon Observatory at Paris, France as well as other groups in German, Holland and the U.K.

10.0026, ANALYSIS OF DIFFERENCES BETWEEN THE OBSERVED AND THEORETICAL POSITIONS OF MARS

R.L. Duncombe, University of Texas, Austin Campus, School of Engineering, Dept. of Aerospace Engineering & Engineering Mechanics, *200 W. 21st, Austin, Texas* 78712

Transit Circle and Astrolabe observations of Mars at all oppostions from 1950 to 1975 show departures in declination from an ephemeris based on the theory of G.M. Clemence. Analysis has shown that the discrepancy arises from an error in the secular change of the inclination of the orbit of Mars. A new geocentric ephemeris incorporating this correction is being prepared.

10.0027, THE EVOLUTION OF STARS IN METAL DEFICIENT SYSTEMS AND RELATED PROBLEMS IN OTHER STARS

R.T. Rood, University of Virginia, School of Arts & Sciences, Dept. of Astronomy, *Garrett Hall, Charlottesville, Virginia* 22903 (AST76-23170 A01)

This research will involve studies of the structure of stars in galactic globular clusters and dwarf spheroidal galaxies. There will be an analysis of the effect of abundance anomalies on the stars of galactic globular clusters and dwarf spheroidal galaxies which are extremely deficient in their heavy element abundances. An attempt will be made to find improved ways of connecting theoretical calculations and observational data in these systems.

10.0028, NOBLE GAS GEOCHRONOLOGY OF METEORITES

F.A. Podosek, Washington State University, School of Arts & Sciences, Dept. of Earth & Planetary Sciences, *Administration Bldg., Room 101, Pullman, Washington* 99163 (EAR7823853)

This project is focused on study of the chronology of the earth solar system, based on the natural radionuclides 129I, 244Pu and 40K. The experimental work principally involves noble gas mass spectrometric analyses of selected meteorites, but other techniques also play important roles. The chronological information is contained in the relationships between the parent radionuclides and their noble gas decay products (129Xe, fission Xe, 40Ar).

In addition to a study of the chronology of events in the early solar system, this program is also an investigation of more general aspects of solar system isotopic structures and the apparent lack of complete homogenization of the various nucleosynthetic products of which the solar system is made. This results from determination of the isotopic composition of xenon in the material from which meteorites formed and from establishing limits to the possibly heterogeneous distribution of short-lived radionuclides. For the latter the simultaneous study of 129I, 244Pu and absolute chronology by 40Ar-39Ar analysis is an important feature of the proposed program.

GENERAL

11.0001, SUMMER RESEARCH FELLOWSHIP PROGRAM

G.C. Darden, Hampton Inst., Graduate School, Dept. of Mathematics, *Hampton, Virginia* 23368 (NAS 1-14832)

The main purpose of the Summer Research Fellowship Program is to involve more predominantly black colleges and universities in activities of the National Aeronautics and Space Administration in a way that will strengthen and expand the academic programs of these institutions.

OBJECTIVES OF THE PROGRAM: 1. To promote cooperative ventures between these institutions and the Langley Research Center; 2. To increase the resource base available to the Langley Research Center for application to its research mission; 3. To expand the academic program at participating institutions.

PARTICIPANTS: The program provides ten persons the opportunity to engage in research at the Langley Research Center for ten weeks during the summer. Participants are required to write a report on their respective projects which are chosen from a list developed by the divisions of the Center. Each participant works with a Center scientist during the summer and has full access to equipment necessary to complete the project.

SUPPORTED BY U.S. National Aeronautics & Space Admin., Langley Research Center

11.0002, NASA-MORGAN STATE UNIVERSITY SUMMER FACULTY RESEARCH PROGRAM

N.K. Proctor, Morgan State University, Graduate School, Dept. of Biology, *Hillen Rd. & Cold Spring Ln., Baltimore, Maryland* 21212 (NGT 21-025-006)

The purpose of the Summer Faculty Research program is to (1) benefit the academic process at participating institutions; (2) further cooperation between participating institutions and Goddard Space Flight Center; and (3) increase the resources available to Goddard for application to its research mission. Selected faculty engage in research at Goddard Space Flight Center during a 10-week period and work under the supervision of technical monitors from Goddard. Problems investigated by faculty are in the areas of mathematics, computer science, physics, chemistry, management systems, and engineering. Goddard provides specific problems in the above areas and participants are selected based on prior education and experience.

USER DEFINITION AND MISSION REQUIREMENTS FOR UNMANNED AIRBORNE PLATFORMS, REVISED Final Report
M. B. Kuhner and J. R. McDowell Dec. 1979 87 p Revised (Contract NAS6-2938)
(NASA-CR-156861) Avail: NTIS HC A05/MF A01 CSCL 02A

The airborne measurement requirements of the scientific and applications experiment user community were assessed with respect to the suitability of proposed strawman airborne platforms. These platforms provide a spectrum of measurement capabilities supporting associated mission tradeoffs such as payload weight, operating altitude, range, duration, flight profile control, deployment flexibility, quick response, and recoverability. The results of the survey are used to examine whether the development of platforms is warranted and to determine platform system requirements as well as research and technology needs. J.M.S.

A CONSIDERATION OF GENERAL AVIATION IN THE UNITED KINGDOM
R. E. Caves May 1979 73 p refs
(TT-7902; ISSN-0140-9751) Avail: NTIS HC A04/MF A01

A semistructural analysis of the operational and economic viability on 1978 data, is presented. Models of contemporary fare structures, bloc times, and costs are developed in order to determine break even values for third level scheduled operations. Two potentially attractive routes from a theoretical stand point are examined to demonstrate the marginal nature of third level operations. Some attention is given to airport access, to nonscheduled general aviation, and to the relevance of the results within present U.K. transport planning choices. Author (ESA)

DYNAMIC STALL ON OSCILLATING AIRFOILS IN OSCILLATING FREE-STREAMS Ph.D. Thesis
Bang-Ji Hsieh 1979 278 p
Avail: Univ. Microfilms Order No. 8003648

The dynamic stall phenomenon on an oscillating airfoil in the presence of the free stream oscillations was studied. The study was conducted on a NACA 0012 profile airfoil which was oscillating in pitch around a mean angle of attack of 15 degrees with an amplitude of 10 degrees. The corresponding range of angles extending from 5 to 25 degrees includes the angle of stall of a stationary airfoil in steady flow which was about 12 degrees under present conditions. Tests were made in both steady and oscillating free streams and at the two reduced frequencies of 0.15 and 0.25. Education, i.e., periodic sampling and averaging was used to remove the nonphase related noise from the pressure signals providing an instantaneous ensemble average which was phase related to the oscillation of the airfoil, of the free stream, or both. The instantaneous distributions of pressure coefficient, normal force coefficient and moment coefficient were computed from the instantaneous educted pressure signals in terms of the instantaneous dynamic pressure of the free stream. Comparisons between tripped and untripped flows and between the flows at the two reduced frequencies are discussed. Dissert. Abstr.

AN EXPERIMENTAL INVESTIGATION OF TWO LARGE ANNULAR DIFFUSERS WITH SWIRLING AND DISTORTED INFLOW
William T. Eckert, James P. Johnston (Stanford Univ., Calif.), Tad D. Simons (Stanford Univ., Calif.), Kenneth W. Mort, and V. Robert Page Feb. 1980 106 p refs
(NASA-TP-1628; AVRADCOM-TR-79-40; A-7436) Avail: NTIS HC A06/MF A01 CSCL 01A

Two annular diffusers downstream of a nacelle-mounted fan were tested for aerodynamic performance, measured in terms of two static pressure recovery parameters (one near the diffuser exit plane and one about three diameters downstream in the settling duct) in the presence of several inflow conditions. The two diffusers each had an inlet diameter of 1.84 m, an area ratio of 2.3, and an equivalent cone angle of 11.5, but were distinguished by centerbodies of different lengths. The dependence of diffuser performance on various combinations of swirling, radially distorted, and/or azimuthally distorted inflow was examined. Swirling flow and distortions in the axial velocity profile in the annulus upstream of the diffuser inlet were caused by the intrinsic flow patterns downstream of a fan in a duct and by artificial intensification of the distortions. Azimuthal distortions or defects were generated by the addition of four artificial devices (screens and fences). Pressure recovery data indicated beneficial effects of both radial distortion (for a limited range of distortion levels) and inflow swirl. Small amounts of azimuthal distortion created by the artificial devices produced only small effects on diffuser performance. A large artificial distortion device was required to produce enough azimuthal flow distortion to significantly degrade the diffuser static pressure recovery. Author

WIND-TUNNEL/FLIGHT CORRELATION STUDY OF AERODYNAMIC CHARACTERISTICS OF A LARGE FLEXIBLE SUPERSONIC CRUISE AIRPLANE (XB-70-1). 3: A COMPARISON BETWEEN CHARACTERISTICS PREDICTED FROM WIND-TUNNEL MEASUREMENTS AND THOSE MEASURED IN FLIGHT

Henry H. Arnaiz, John B. Peterson, Jr. (NASA Langley Research Center), and James C. Daugherty (NASA Ames Research Center). Mar. 1980. 59 p. refs.

(NASA-TP-1516; H-1079) Avail: NTIS HC A04/MF A01 CSCL 01A

A program was undertaken by NASA to evaluate the accuracy of a method for predicting the aerodynamic characteristics of large supersonic cruise airplanes. This program compared predicted and flight-measured lift, drag, angle of attack, and control surface deflection for the XB-70-1 airplane for 14 flight conditions with a Mach number range from 0.76 to 2.56. The predictions were derived from the wind-tunnel test data of a 0.03-scale model of the XB-70-1 airplane fabricated to represent the aeroelastically deformed shape at a 2.5 Mach number cruise condition. Corrections for shape variations at the other Mach numbers were included in the prediction. For most cases, differences between predicted and measured values were within the accuracy of the comparison. However, there were significant differences at transonic Mach numbers. At a Mach number of 1.06 differences were as large as 27 percent in the drag coefficients and 20 deg in the elevator deflections. A brief analysis indicated that a significant part of the difference between drag coefficients was due to the incorrect prediction of the control surface deflection required to trim the airplane. SOLUTION OF A FEW NONLINEAR PROBLEMS IN AERODYNAMICS BY THE FINITE ELEMENTS AND FUNCTIONAL LEAST SQUARES METHODS. Ph.D. Thesis - Paris Univ.

Jacques Periaux. Dec. 1979. 278 p. refs. Transl. into ENGLISH of "Resolution de quelques Problems non Lineaires en Aerodynamique par des Methodes d'Elements Finis et de Moindres Carres Fonctionnels" Paris, 19 Jun. 1979. 280 p. Transl. by Kanner (Leo) Associates, Redwood City, Calif.

(Contract NASw-3199)

(NASA-TM-75732) Avail: NTIS HC A13/MF A01 CSCL 01A

The numerical simulation of the transonic flows of idealized fluids and of incompressible viscous fluids, by the nonlinear least squares methods is presented. The nonlinear equations, the boundary conditions, and the various constraints controlling the two types of flow are described. The standard iterative methods for solving a quasi elliptical nonlinear equation with partial derivatives are reviewed with emphasis placed on two examples: the fixed point method applied to the Gelder functional in the case of compressible subsonic flows and the Newton method used in the technique of decomposition of the lifting potential. The new abstract least squares method is discussed. It consists of substituting the nonlinear equation by a problem of minimization in a H to the minus 1 type Sobolev functional space. A.W.H.

FULL SCALE VISUALIZATION OF THE WING TIP VORTICES GENERATED BY A TYPICAL AGRICULTURAL AIRCRAFT. Final Report

Ernest J. Cross, Jr., Phillip D. Bridges, Joe A. Brownlee, W. Wayne Livingston et al. Jan. 1980. 102 p. refs.

(Contract NsG-1511)

best copy available

(NASA-CR-162796; MSSU-EIRS-ASE-80-2) Avail: NTIS HC A06/MF A01 CSCL 01A

The trajectories of the wing tip vortices of a typical agricultural aircraft were experimentally determined by flight test. A flow visualization method, similar to the vapor screen method used in wind tunnels, was used to obtain trajectory data for a range of flight speeds, airplane configurations, and wing loadings. Detailed measurements of the spanwise surface pressure distribution were made for all test points. Further, a powered 1/8 scale model of the aircraft was designed, built, and used to obtain tip vortex trajectory data under conditions similar to that of the full scale test. The effects of light wind on the vortices were demonstrated, and the interaction of the flap vortex and the tip vortex was clearly shown in photographs and plotted trajectory data. Author

EFFECT OF SWEEP AND ASPECT RATIO ON THE LONGITUDINAL AERODYNAMICS OF A SPANLOADER WING IN- AND OUT-OF-GROUND EFFECT

Scott O. Kjelgaard and John W. Paulson, Jr. Jan. 1980 166 p. refs

(NASA-TM-80199) Avail: NTIS HC A08/MF A01 CSCL 01A

A wind tunnel investigation was conducted to determine the effects of leading edge sweep, aspect ratio, flap deflection, and eleven deflection on the longitudinal aerodynamic characteristics of a span distributed load advanced cargo aircraft (spanloader). Model configurations consisted of leading edge sweeps of 0, 15, 30, and 45 deg and aspect ratios of approximately 2, 4, 6, and 8. Data were obtained for angles of attack of -8 to 18 deg out of ground effect and at angles of attack of -2, 0, and 2 deg in ground effect at Mach number equal 0.14. Flap and elevon deflections ranged from -20 to 20 deg. The data presented in tabulated form are intended for reference purposes and are presented without analysis. A.W.H.

A CALCULATION PROCEDURE FOR VISCOUS FLOW IN TURBOMACHINES, VOLUME 2

J. Khalil and W. Tabakoff Jan. 1980 54 p. refs

(Contract NAS3-21609; DA Proj. 1L1-61102-AH-45)

(NASA-CR-159636) Avail: NTIS HC A04/MF A01 CSCL 21E

Turbulent flow within turbomachines having arbitrary blade geometries is examined. Effects of turbulence are modeled using two equations, one expressing the development of the turbulence kinetic energy and the other its dissipation rate. To account for complicated blade geometries, the flow equations are formulated in terms of a nonorthogonal boundary fitted coordinate system. The analysis is applied to a radial inflow turbine. The solution obtained indicates the severity of the complex interaction mechanism that occurs between the different flow regimes (i.e., boundary layers, recirculating eddies, separation zones, etc.). Comparison with nonviscous flow solutions tend to justify strongly the inadequacy of using the latter with standard boundary layer techniques to obtain viscous flow details within turbomachine rotors. Capabilities and limitations of the present method of analysis are discussed. M.G.

AN EXPERIMENTAL STUDY OF TWO-DIMENSIONAL SUPERSONIC JET IMPINGEMENT ON A FLAT PLATE

T. F. Zien and R. T. Driftmyer Aug. 1979 95 p. refs

(AD-A076536; NSWC/TR-79-289) Avail: NTIS HC A05/MF A01 CSCL 20/4

An experimental study of the flow field associated with a two-dimensional, supersonic jet impinging normally on a flat plate is reported. Two wedge nozzles manufactured at the design Mach numbers of 1.75 and 2.75, respectively, were used to provide the jet. Extensive pitot surveys of the free jet were first conducted to determine the quality of the free jet. Results indicate that the simple wedge nozzles were adequate in providing the desired two-dimensional jet in the free expansion configuration. Results of surface pressure measurements and schlieren photographs of the impingement flow indicating the shock patterns are then presented and discussed. Although the results are principally reported for the case of the jet at isentropic exit conditions, some results of underexpanded and overexpanded jets are also included. Some discrepancies between the experiment and the simple theory based in the method of integral relations and the inviscid flow model are noted and discussed. An 'effective' jet Mach number is introduced which accounts largely for the discrepancy between experiments and theory, and its determination is based on the measured stagnation point pressure on the plate surface. NUMERICAL SOLUTION OF A SUPERSONIC NOZZLE AFTERBODY FLOW WITH JET EXHAUST Final Report, Sep. 1976 - Feb. 1978

Ameer G. Mikhail Jun. 1979 69 p. refs

(Contract F33615-76-C-3145; AF Proj. 2307)

(AD-A076116; UDR-TR-79-43; AFFDL-TR-79-3078) Avail: NTIS HC A04/MF A01 CSCL 20/4

Numerical solutions to the compressible turbulent Navier-Stokes equations for supersonic flow at Mach number 1.5, past an axisymmetric nozzle boattail with jet exhaust were obtained using MacCormack's explicit numerical scheme. The AGARD 10 deg-nozzle was considered and a total of five cases were computed showing the effects of boattail geometry, jet-exhaust temperature, boattail wall temperature and the differences with the corresponding two-dimensional case. It was established that the hot boattail surface reduces the pressure drag significantly as does the hot jet exhaust when compared with the cold wall, cold exhaust case. The present approach can be used directly for boattailing nozzles for minimum pressure drag, as well as for a parametric study for aircraft designers. GRA

CALCULATION OF SUBSONIC NORMAL FORCE AND CENTRE OF PRESSURE POSITION OF BODIES OF REVOLUTION USING SLENDER BODY THEORY BOUNDARY LAYER METHOD

K. D. Thomson Apr. 1979 37 p. refs

(AD-A076128; WSRL-0093-TR; AR-001-656) Avail: NTIS HC A03/MF A01 CSCL 20/4

The aim of this report is to present a method of predicting the aerodynamic characteristics of slender bodies of revolution at small incidence, under flow conditions such that the boundary layer is turbulent. Firstly, a panel method based on slender body theory is developed and used to calculate the surface velocity

distribution on the body at zero incidence. Secondly, this velocity distribution is used in conjunction with an existing boundary layer estimation method to calculate the growth of boundary layer displacement thickness which is added to the body to produce the effective aerodynamic profile. Finally, recourse is again made to slender body theory to calculate the normal force curve slope and center of pressure position of the effective aerodynamic profile. Comparisons made between predictions and experiment for a number of slender bodies extending from highly boattailed configurations to ogive-cylinders, and covering a large range of boundary layer growth rates, indicate that the method is useful for missile design purposes. THEORETICAL ANALYSIS OF THE FLOW FIELD OVER A FAMILY OF OGIVE BODIES, VOLUME 2

R. L. Richardson and B. Z. Jenkins. 20 Aug. 1979. 56 p. refs. (AD-A077397; DRSMI-T-CR-77-5). Avail: NTIS. HC A04/MF A01. CSCL 20/4.

Local normal force distributions are presented for pointed tangent ogive bodies and spherically blunted tangent ogive bodies at free stream Mach numbers of 2 to 4.5 at 2 deg angle-of-attack. Also, total or integrated values of normal force coefficients, pitching moment coefficients, and centers of pressure are given for all body shapes as a function of free stream Mach number for the same angle of attack. These data were obtained using the US Army Missile Command three-dimensional method of characteristics computer code. GRA

DATA REPORT FOR A TEST PROGRAM TO STUDY TRANSONIC FLOW FIELDS ABOUT WING-BODY/PYLON/STORE COMBINATIONS. VOLUME 1: TUNNEL EMPTY FLOW SURVEY DATA, WING BODY FORCE/MOMENT/SURFACE PRESSURE DATA, AND PRESSURE STORE FORCE/MOMENT/SURFACE PRESSURE DATA. Interim Summary Report, 14-22 Feb. 1978

S. S. Stahara and A. J. Crisalli. May 1978. 256 p.
(Contract F44620-75-C-0047; AF Proj. 2307)
(AD-A077182; AFOSR-79-1070TR; NEAR-TR-163-Vol-1). Avail: NTIS. HC A12/MF A01. CSCL 20/4.

Results are presented for transonic wind tunnel tests conducted in the 4T Wind Tunnel at Arnold Engineering and Development Center for various wing-body/pylon store model combinations. Experimental data were obtained at 0.2, and 5 degrees angle of attack of the model combinations and at Mach numbers of 0.925, 0.950, 1.05, and 1.10 in the transonic range. Pylon and store models were attached to a wing-body combination in two separate, systematic model build-up sequences. At each stage of the first sequence, flow velocities and static pressures were obtained in the vicinity of the store or those regions normally occupied by a store while force, moment, and surface pressure measurements were taken on the wing-body model. Also, flow velocities and static pressure were recorded on a cylindrical control surface far from the tunnel centerline to provide outer flow field conditions. The second model build-up sequence involved a special pressure-instrumented store that was mounted on the captive trajectory system for simulating a separating store. Detailed pressure distributions and loading were obtained on the store. GRA

DATA REPORT FOR A TEST PROGRAM TO STUDY TRANSONIC FLOW FIELDS ABOUT WING-BODY/PYLON/STORE COMBINATIONS. VOLUME 2: FLOW FIELD SURVEY DATA FOR CONFIGURATIONS 21 AND 22. Interim Report, 14-23 Feb. 1978

S. S. Stahara and A. J. Crisalli. May 1978. 247 p.
(Contract F44620-75-C-0047; AF Proj. 2307)
(AD-A077153; AFOSR-79-1071TR; NEAR-TR-163-Vol-2). Avail: NTIS. HC A11/MF A01. CSCL 20/4.

This volume of the data report presentes the flow-field survey data for configurations 21 and 22 at Mach numbers M1 = 0.925, M2 = 0.950, and M3 = 1.05 and angles of attack alpha = 0, 2, and 5 degrees. The data were obtained in the 4T Wind Tunnel at Arnold Engineering and Development Center. These tests, performed at a nominal Reynolds number per foot of 3.0 x 10 to the 6th power are indexed and outlined. GRA

TRANSIENT EFFECTS ON A STALLED AIRFOIL IN A PULSATING FLOW: COMPARISON WITH RESULTS FROM A SIMILAR AIRFOIL UNDERGOING HORIZONTAL SHAKING [EFFETS INSTATIONNAIRES SUR UN PROFIL EN DECROCHAGE DANS UN ECOULEMENT PULSE; COMPARISON AVEC LE MOUVEMENT DE TAMIS]

C. Maresca, D. Favier, and J. Rebont. Paris: Assoc. Aeron. et Astronautique de Paris, 1979. 66 p. refs. In FRENCH; ENGLISH summary. Presented at 15th Colloq. d'Aerodyn. Appl., Marseille, 7-9 Nov. 1978.
(Contract STTA-77/98/313/00/481/75/86)
(AAAF-NT-79-13; ISBN-2-7170-0540-4). Avail: NTIS. HC A04/MF A01; CEDOCAR, Paris FF 29 (France and EEC) FF 33 (others).

The unsteady effects encountered by a symmetrical airfoil NACA 0012 set at fixed indicence (20 deg) in an oscillating flow (delta V/V = 0.74; C sub omega/2V = 0.65; Re = 70,000) were studied. The results were obtained through measurements of aerodynamic components (lift, drag, moment) evidenced by distributions of the static pressure and skin friction along the chord of the airfoil and through visualizations around the airfoil at different phases of the period. The results are discussed and compared with those already obtained on the same airfoil moving forward-backwards in a uniform flow under the same conditions. As far as the mean effects on the lift, drag, pressure distribution, and vortex shedding mechanism on the upper side of the airfoil are concerned, the reciprocity of the two kinds of flow is demonstrated. IMPLEMENTATION OF UNSTEADY OSCILLATORY FLOW IN A TRANSONIC WIND TUNNEL [MISE AU POINT D'ECOULEMENTS INSTATIONNAIRES OSCILLATOIRES DANS UNE SOUFFLERIE TRANSSONIQUE]

A. Mignosi, J. L. Gobert, and C. Quemard. Paris: Assoc. Aeron. et Astronautique de France, 1979. 42 p. refs. In FRENCH; ENGLISH summary. Presented at 15th Colloq. d'Aerodyn. Appl., Marseille, 7-9 Nov. 1978.
(AAAF-NT-79-15; ISBN-2-7170-0542-0). Avail: NTIS. HC A03/MF A01; CEDOCAR, Paris FF 29 (France and EEC) FF 33 (others).

Oscillatory flow was obtained in an injector driven transonic wind tunnel through periodic variation of the downstream throat area by rotation of a suitable shaped cam. The measurement techniques and the probes developed for the experimental studies are described. The characteristics of the unsteady flow in the test section are compared with the results from computations based on the resolution of the unsteady equations. One dimensional flow is assumed. The possibilities of such a device are illustrated by a preliminary study of a wing profile in a transonic flow. The oscillation of both the shock wave and the wake in answer to flow pulsation is shown. Author (ESA)

UNSTEADY FLOW MEASUREMENTS IN AIR INTAKES [MESURES INSTATIONNAIRES DANS UNE PRISE D'AIR]

M. Grandjacques. Paris: Assoc. Aeron. et Astronautique de France, 1979. 23 p. refs. In FRENCH. Presented at 15th Colloq. d'Aerodyn. Appl., Marseille, 7-9 Nov. 1978.
(AAAF-NT-79-16; ISBN-2-7170-0543-9). Avail: NTIS. HC A02/MF A01; CEDOCAR, Paris FF 17 (France and EEC) FF 21 (others).

The means for studying the steady and unsteady flow of air intakes by measuring the pressures at the compressor inlet plane are described. Improved instantaneous differential pressure measurement devices are described which extend the range of utilization from 40 C to 100 C and compensate the zero and sensitivity thermal offsets. The system was assembled for simultaneous measurement in 40 channels at a rate of up to

1700 pressure measurements per second. The results show that the system is adequate for industrial applications, yielding a precision range on the order of 0.5%. Author (ESA)

ON THE PULSATION OF A NORMAL SHOCK WAVE CONTAINED IN AN AERODYNAMIC INLET [PULSATION D'UN CHOC DROIT EN AERODYNAMIQUE INTERNE]
A. Agnes, E. Brocher, and H. Miton. Paris: Assoc. Aeron. et Astronautique de France, 1979. 21 p. refs. In FRENCH; ENGLISH summary. Presented at 15th Colloq. d'Aerodyn. Appl., Marseille, 7-9 Nov. 1978. Sponsored by Direc. des Rech. Etudes et Tech. (DRET).
(AAAF-NT-79-17; ISBN-2-7170-0544-7) Avail: NTIS HC A02/MF A01; CEDOCAR, Paris FF 17 (France and EEC) FF 21 (others).

The response of a normal shock wave, located in a nozzle to down stream pressure perturbation was determined. The system for generating pulsations is described, which consists basically of a Hartmann Sprenger tube in which oscillations of up to 30 KHz can be produced. Initial results are presented showing the two frequencies at which the shock wave oscillations are particularly intense. The computation method for the shock wave oscillation amplitude is also discussed. Author (ESA)

THE GUST AS A COHERENT STRUCTURE IN THE TURBULENT BOUNDARY LAYER
Haakan Gustavsson and Magnus Linde. 1979. 19 p. refs.
(Contract SWED-BESD-5061-012)
(FFA-TN-AU-1499-Pt-5) Avail: NTIS HC A02/MF A01.

Gusts in the atmospheric boundary layer are coherent structures which seem to have very characteristic features. The same kind of structures were found in turbulent boundary layers investigated in the laboratory. The results of such experiments were used to formulate a model for the gust which emphasizes its deterministic features. As a result, the gust structure is scaled on the outer variables of the boundary layer, i.e., the thickness of the boundary layer and the free stream velocity. The gust's longitudinal extent is considerably larger than its lateral one. Its front has a slope in the wind direction. Within the gust, there is first a decrease in the longitudinal velocity followed by a steep rise and a subsequent slow decay to the mean value.

THE AERIAL RELAY SYSTEM: AN ENERGY-EFFICIENT SOLUTION TO THE AIRPORT CONGESTION PROBLEM
Albert C. Kyser. Jan. 1980. 24 p. refs. Presented at the AIAA Aircraft Systems and Technol. Meeting, New York, 22 Aug. 1979.
(NASA-TM-80208) Avail: NTIS HC A02/MF A01 CSCL 17B

The ability to transfer airline passengers between aircraft in flight, if adequately developed and integrated into the national air transportation system, could provide significant improvements in transportation-system performance, in terms of airport congestion, fuel consumption, and passenger service. The proposed Aerial Relay System concept, which was developed as a means of exploiting inflight transfer, makes use of large 'cruise liner' aircraft which fly continuously along their routes, docking periodically with short-haul feeder aircraft for exchange of payloads. Preliminary vehicle designs for a representative system are described and the operational feasibility of the concept for the United States in the 1990's is discussed. R.E.S.

HUMAN FACTORS IN HIGH SPEED LOW LEVEL ACCIDENTS: A 15 YEAR REVIEW
R. C. Rud and D. F. Leben. Jul. 1979. 13 p. refs.
(AD-A076221; DCIEM-79-R35) Avail: NTIS HC A02/MF A01 CSCL 01/2

The Canadian Forces introduced the gf 104G into Squadron Operation in 1963 and since that time these aircraft have operated in the high-speed, low-level environment in both the strike/reconnaissance and tactical support roles. Fifty-seven accidents involving these aircraft are reviewed with regard to cause factors. Marginal weather appears to be the one most significant factor contribution to low-level, high-speed accidents however, several human factors such as visual contrast problems, fatigue, stress, reaction time, 'mission completion' syndrome, inattention and task overload were identified. Aspects of accidents which typify human factors problems are described. Suggested possible preventive measures are outlined. Author (GRA)

FEASIBILITY TESTING OF A BODY INFLATABLE BLADDER (BIB) RESTRAINT DEVICE Phase Report
Marcus Schwartz. Apr. 1979. 46 p.
(WF41400000)
(AD-A078681; NADC-79241-60) Avail: NTIS HC A03/MF A01 CSCL 06/17

A feasibility model of an inflatable type restraint system was designed and developed for use with existing operational restraint hardware to improve crewman safety during ejection. The vest type inflatable system is worn over the flight suit and

under the MA-2 integrated torso harness. Upon inflation, the crewman is forced back into the suit while slack is removed from the harness. Subsequent ejection tower testing has demonstrated significant reductions in horizontal head and torso response during the catapult phase of the ejection. Author (GRA)

A NEW APPROACH TO MULTI-SENSOR NAVIGATION SYSTEM DESIGN
Michael Joseph Cannon. 1979. 126 p.
Avail: Univ. Microfilms. Order No. 8004147.
The flexibility and power of digital processors in the design of aviation navigation systems is discussed. Navigation systems which use a variety of input sensors and which use processors to integrate the system components are examined. Methods for counting errors in specific sensor inputs are examined in terms of the characteristics of the sensors. The set of input sensors, when properly chosen, can complement one another in the information they provide and in their operating domains. Overlap in the information provided makes possible cross checking for sensor errors or equipment failure and allows for a variety of degraded or backup mode operations. These areas in navigation systems and their design are emphasized. Dissert. Abstr.

RIM INERTIAL MEASURING SYSTEM. Patent Application
Nelson J. Groom, Willard W. Anderson, and William H. Phillips, inventors (to NASA). Filed 7 Dec. 1979. 27 p.
(NASA-Case-LAR-12052-1; US-Patent-Appl-SN-102002) Avail: NTIS. HC A03/MF A01. CSCL 17G.
A strapdown inertial measuring system for measuring angular rate and linear accelerations about a spacecraft is disclosed. The system uses an annular momentum control device (AMCD) as the basic sensor. Features of the device include reliability, zero friction, zero wear, low volume, high momentum to mass ratio, and zero breakout forces. The AMCD is comprised of a rim and several magnetic bearing stations to control the position of the rim in the axial and radial directions. Signals from axial position sensors are used to compute the angular rates about first and second mutually perpendicular axes in the plane or the rim and the linear acceleration along a third axis perpendicular to the first and second axes. Signals from radial position sensors are used to compute the linear accelerations along the first and second axes. J.M.S.

HELICOPTER REMOTE WIND SENSOR SYSTEM DESCRIPTION
D. H. Dickson and Charles M. Sonnenschein. Sep. 1979. 57 p.
(DA Proj. 1L1-62111-AH-71)
(AD-A076153; ERADCOM/ASL-TR-0040) Avail: NTIS. HC A04/MF A01. CSCL 14/2
The helicopter remote wind sensor (HRWS) is an application of a laser Doppler velocimeter. This system description describes the HRWS fabricated by Raytheon Company for the US Army Atmospheric Sciences Laboratory. The HRWS was designed to measure wind fields in an aircraft turbulent environment. The operational emphasis is to augment an attack helicopter's fire control system. This CO2 laser heterodyne system remotely measures three dimensional winds from 1 to 33 meters in front of the sensor. The HRWS was mounted in an external pod compatible with AH-1, AAH and UH-1 wing stores or a fixed wing aircraft equipped with standard wing shackles. The HRWS theory, functions, and subsystem are discussed. Data from flight and ground testing will be presented in a later report. GRA

(AD-A078809; UVA/525350/EE79/102; ONR-CR-233-092-1) Avail: NTIS. HC A09/MF A01. CSCL 17/7
The search for and development of algorithms for a real-time, automatic system capable of tracking 2-D targets in complex scenes is discussed. The problems and constraints involved in such an undertaking as well as previous efforts are summarized. No algorithms could be found in the literature that will provide satisfactory results for realistic conditions. A mathematical model of scene spatial and temporal evolution is developed for certain classes of targets and target perturbations. It is shown that for small target perturbations the 2-D tracking problem may be approximated as a 1-D time-varying parameter estimation problem. A novel and CCD-implementable solution is developed which is superior to previously developed algorithms, particularly when considering target rotation and dilation and target/background separation. Results of system simulation and suggestions for future research are presented. GRA

SYNTHESIS OF ROTOR TEST DATA FOR REAL-TIME SIMULATION
M. A. McVeigh. Mar. 1979. 232 p. refs.
(Contract NAS2-9015)
(NASA-CR-152311; D210-11505-1) Avail: NTIS
HC A11/MF A01 CSCL 01C

A mathematical model of a hingeless tilting rotor is presented. The model was obtained by a systematic curve fit procedure applied to an extensive set of model scale wind tunnel data. The math model equations were used in a real time flight simulation model of a hingeless tilt rotor XV-15 to assess changes in flying qualities compared to those obtained using a previous rotor model. Extensive plots of the rotor derivatives are given. Discussions of attempts to apply multivariable linear regression techniques to the data and the use of an analytical rotor representation are included. Author

A HINGELESS ROTOR XV-15 DESIGN INTEGRATION FEASIBILITY STUDY. VOLUME 1: ENGINEERING DESIGN STUDIES. Final Report
J. P. Magee and H. R. Alexander. Mar. 1978. 473 p.
(Contract NAS2-9015)
(NASA-CR-152310; D210-11360-1-Vol-1) Avail: NTIS
HC A20/MF A01 CSCL 01C

A design integration feasibility study was carried out to investigate what modifications to the basic XV-15 were necessary to accomplish a flight demonstration of the XV-15 with a Boeing hingeless rotor. Also investigated were additional modifications which would exploit the full capability provided by the combination of the new rotor and the existing T53 engine. An evaluation of the aircraft is presented and the data indicate improved air vehicle performance, acceptable aeroelastic margins, lower noise levels and improved flying qualities compared with the XV-15 aircraft. Inspection of the rotor system data provided shows an essentially unlimited life rotor for the flight spectrum anticipated for the XV-15. R.E.S.

CONCEPTS FOR GENERATING OPTIMUM VERTICAL FLIGHT PROFILES
John A. Sorensen. Sep. 1979. 107 p. refs.
(Contract NAS1-15497)
(NASA-CR-159181) Avail: NTIS HC A06/MF A01 CSCL 01C

Algorithms for generating optimum vertical profiles are derived and examined. These algorithms form the basis for the design of onboard flight management concepts. The variations in the optimum vertical profiles (resulting from these concepts) due to variations in wind, takeoff weight, and range-to-destination are presented. Further considerations for mechanizing two different onboard methods of computing near-optimum flight profiles are then outlined. Finally, the results are summarized, and recommendations are made for further work. Technical details of optimum trajectory design, steering requirements for following these trajectories, and off-line computer programs for testing the concepts are included. J.M.S.

PERFORMANCE ESTIMATES OF A BOEING 747-100 TRANSPORT MATED WITH AN OUTSIZE CARGO POD
Lloyd S. Jernell. Feb. 1980. 20 p. refs.
(NASA-TM-80227) Avail: NTIS HC A02/MF A01 CSCL 01C

The design mission performance of a Boeing 747-100 aircraft mated with an outsize cargo pod was studied. The basic design requirement was the rapid deployment of a combat loaded mobile bridge launcher from a United States east coast staging base to Europe. Weight was minimized by stripping the aircraft of unneeded, quick removal items and by utilizing graphite-epoxy composite materials for most pod components. The mission analysis was based on wind tunnel data and full scale carrier aircraft and engine data. The results are presented in tabular and graphic form. A.W.H.

HC A11/MF A01 CSCL 01/3

Concern for increasing costs in maintenance of transparency systems has prompted the Air Force Flight Dynamics Laboratory to sponsor this study contract. The object of this study is to identify the high-cost, high maintenance transparency components; identify cause of failures; and recommend corrective programs to reduce cost of ownership to the Air Force Logistics Command. The study involved the review of 20 selected aircraft in current inventory to establish an extensive data base relating transparency maintenance activity and associated logistical support costs. An important adjunct to this study was to research design characteristics, perform a failure analysis, and identify associated logistical support cost for each study aircraft. By using a selective process of correlating the transparency failure modes and maintenance costs with the relative stature of aircraft in current inventory, corrective programs were established and verified by life-cycle cost trades. These corrective programs entailed a comprehensive search for various design improvement that could be innovated to negate the reported failures. The study results contained herein are an extension of objectives of the original program and are directed at supplementing the corrective programs for six additional aircraft. GRA

DESIGN AND TEST OF A BORON - ALUMINUM HIGH TEMPERATURE WING. Final Report
R. J. Richey and T. E. Hess. May 1979. 106 p. refs.
(AD-A075814; NADC 79145-60) Avail: NTIS
HC A06/MF A01 CSCL 01/3

The feasibility of utilizing the high buckling stability characteristics of boron - aluminum advanced composite material in a simple, low-cost spar-rib-skin construction for a thin airfoil structure was investigated for high temperature application up to 589 K. The design concept developed consists of boron-aluminum skins, to carry the primary bending and torsion loads, mechanically fastened to a light gage steel sub-structure, which resists transverse shear and stabilizes the skins. The viability of the concept depends on whether this stabilization of the skin material can be accomplished with a practical number and spacing of substructure elements. A weight saving of one third in comparison to the production article is projected in this boron-aluminum version of the BYM-34E wing. A major wing subcomponent was fabricated and static tested to validate the structural adequacy of the overall design. GRA

HC A08/MF A01 CSCL 01/3

Dynamic analysis, preliminary design, and performance/cost trade studies of air bag skid and air cushion concepts for launch and recovery of Boeing and Rockwell advanced RPV concepts have been conducted. Dynamic analysis was performed using the six degree-of-freedom computer program EASY. Dynamic simulations included perturbations to steady state flight, landing, and takeoff simulations. Launch and recovery concepts investi-

gated were air bag skid system, air cushion recovery system, integrated air cushion system, and air cushion launch platform. Performance/cost trade study factors investigated were complexity, fuel requirements, adverse weather capability, ground equipment and facility requirements, survivability, reliability and maintainability, and system acquisition and life cycle costs. Results of the study indicated that an air cushion system is a feasible means of recovery of an RPV such as the Boeing and Rockwell ARPV concepts. An air bag skid with an arrestor system is a feasible approach when minimum field length is a major design factor. Integrated air cushion system for launch and recovery are greatly affected by engine characteristics. In each case, the launch and recovery systems are shown to be an integral part of the total vehicle design and strongly influences the airframe design. GRA

AIR SPEED AND ATTITUDE PROBE Patent
Gerald J. Baker and Merle A. Economu, inventors (to NASA). Issued 15 Jan. 1980, 6 p. Filed 30 May 1978. Supersedes N78-25088 (16 - 16, p. 2077)
(NASA-Case-FRC-11009-1; US-Patent-4,184,149; US-Patent-Appl-SN-910708; US-Patent-Class-340-177VA; US-Patent-Class-73-188; US-Patent-Class-73-189; US-Patent-Class-73-212) Avail: US Patent and Trademark Office. CSCL 01D

An air speed and attitude probe characterized by a pivot shaft normally projected from a data boom and supported thereby for rotation about an axis of rotation coincident with the longitudinal axis of the shaft is described. The probe is a tubular body supported for angular displacement about the axis of rotation and has a fin mounted on the body for maintaining one end of the body in facing relation with relative wind and has a pair of transducers mounted in the body for providing intelligence indicative of total pressure and static pressure for use in determining air speed. A stack of potentiometers coupled with the shaft to provide intelligence indicative of aircraft attitude, and circuitry connecting the transducers and potentiometers to suitable telemetry circuits are described.

EARLY FLIGHT TEST EXPERIENCE WITH COCKPIT DISPLAYED TRAFFIC INFORMATION (CDTI)
Terence S. Abbott, Gene C. Moen (Army Res. and Technol. Labs., Hampton, Va.), Lee H. Person, Jr., Gerald L. Keyser, Jr., Kenneth R. Yenni, and John F. Garren. Feb. 1980, 31 p. refs
(DA Proj. 1L2-62209-AH-76)
(NASA-TM-80221; AVRADCOM-TR-80-B-2) Avail: NTIS HC A03/MF A01 CSCL 01D

Coded symbology, based on the results of early human factors studies, was displayed on the electronic horizontal situation indicator and flight tested on an advanced research aircraft in order to subject the coded traffic symbology to a realistic flight environment and to assess its value by means of a direct comparison with simple, uncoded traffic symbology. The tests consisted of 28 curved, decelerating approaches, flown by research-pilot flight crews. The traffic scenarios involved both conflict-free and blunder situations. Subjective pilot commentary was obtained through the use of a questionnaire and extensive pilot debriefing sessions. The results of these debriefing sessions group conveniently under either of two categories: display factors or task performance. A major item under the display factor category was the problem of display clutter. The primary contributors to clutter were the use of large map-scale factors, the use of traffic data blocks, and the presentation of more than a few aircraft. In terms of task performance, the cockpit displayed traffic information was found to provide excellent overall situation awareness. R.E.S.

THE EFFECT OF VIEWING TIME, TIME TO ENCOUNTER, AND PRACTICE ON PERCEPTION OF AIRCRAFT SEPARATION ON A COCKPIT DISPLAY OF TRAFFIC INFORMATION
Sharon OConnor, Everett Palmer, Daniel Baty, and Sharon Jago. Feb. 1980, 17 p. refs. Prepared in cooperation with San Jose State Univ., Calif.
(Grant NsG-2269)
(NASA-TM-81173; A-8072) Avail: NTIS HC A02/MF A01 CSCL 01D

The concept of a cockpit display of traffic information (CDTI) includes the integration of air traffic, navigation, and other pertinent information in a single electronic display in the cockpit. Two studies were conducted to develop a clear and concise display format for use in later full-mission simulator evaluations of the CDTI concept. Subjects were required to monitor a CDTI for specified periods of time and to make perceptual judgments concerning the future position of a single intruder aircraft in relationship to their own aircraft. Experimental variables included: type of predictor information displayed on the two aircraft symbols; time to encounter point; length of time subjects viewed the display; amount of practice; and type of encounter (straight or turning). Results show that length of viewing time had little or no effect on performance; time to encounter influenced performance with the straight predictor but did not with the curved predictor; and that learning occurred under all conditions. R.E.S.

METHOD AND APPARATUS FOR RAPID THRUST INCREASES IN A TURBOFAN ENGINE Patent
Jack E. Cornett (GE, Cincinnati, Ohio), Ralph C. Corley (GE, Cincinnati, Ohio), Thomas O. Fraley (GE, Cincinnati, Ohio), and Andrew A. Saunders, Jr., inventors (to NASA) (GE, Cincinnati, Ohio). Issued 22 Jan. 1980, 9 p. Filed 9 Dec. 1977. Sponsored by NASA
(NASA-Case-LEW-12971-1; US-Patent-4,184,327; US-Patent-Appl-SN-858936; US-Patent-Class-60-240; US-Patent-Class-60-39.03; US-Patent-Class-60-39.27) Avail: US Patent and Trademark Office. CSCL 21E

Upon a landing approach, the normal compressor stator schedule of a fan speed controlled turbofan engine is temporarily varied to substantially close the stators to thereby increase the fuel flow and compressor speed in order to maintain fan speed and thrust. This running of the compressor at an off-design speed substantially reduces the time required to subsequently advance the engine speed to the takeoff thrust level by advancing the throttle and opening the compressor stators.

STUDY OF RESEARCH AND DEVELOPMENT REQUIREMENTS OF SMALL GAS-TURBINE COMBUSTORS
E. P. Demetri, R. F. Topping, and R. P. Wilson, Jr. Jan. 1980 69 p refs
(Contract NAS3-21980)
(NASA-CR-159796; ADL-83381-2) Avail: NTIS HC A04/MF A01 CSCL 21E

A survey is presented of the major small-engine manufacturers and governmental users. A consensus was undertaken regarding small-combustor requirements. The results presented are based on an evaluation of the information obtained in the course of the study. The current status of small-combustor technology is reviewed. The principal problems lie in liner cooling, fuel injection, part-power performance, and ignition. Projections of future engine requirements and their effect on the combustor are discussed. The major changes anticipated are significant increases in operating pressure and temperature levels and greater capability of using heavier alternative fuels. All aspects of combustor design are affected, but the principal impact is on liner durability. An R&D plan which addresses the critical combustor needs is described. The plan consists of 15 recommended programs for achieving necessary advances in the areas of liner thermal design, primary-zone performance, fuel injection, dilution, analytical modeling, and alternative-fuel utilization. LOW SPEED TEST OF THE AFT INLET DESIGNED FOR A TANDEM FAN V/STOL NACELLE
W. W. Rhoades and A. H. Ybarra Feb. 1980 79 p refs
(Contract NAS3-21468)
(NASA-CR-159752; TR-2-30320/OR-52360) Avail: NTIS HC A05/MF A01 CSCL 21E

An approximately .25 scale model of a Tandem Fan nacelle designed for a Type A V/STOL aircraft configuration was tested in a 10-by-10 foot wind tunnel. A 12 inch, tip driven, turbofan simulator was used to provide the suction source for the aft fan inlet. The front fan inlet was faired over for this test entry. Model variables consisted of a long aft inlet cowl, a short aft inlet cowl, a shaft simulator, blow-in door passages and diffuser vortex generators. Inlet pressure recovery, distortion, inlet angle of attack separation limits were evaluated at tunnel velocities from 0 to 240 knots, angles of attack from -10 to 40 degrees and inlet flow rates representative of throat Mach numbers of 0.1 to 0.6. High inlet performance and stable operation was verified at all design forward speed and angle of attack conditions. The short aft inlet configuration provided exceptionally high pressure recovery except at the highest combination of angle of attack and forward speed. The flow quality at the fan face was somewhat degraded by the addition of blow-in door passages to the long aft inlet configuration due to the pressure disturbances generated by the flow entering the diffuser through the auxiliary air passages. M.M.M.

INVESTIGATION OF THE BOUNDARY LAYER BEHAVIOR ON TURBINE AIRFOILS Final Report, 16 Jun. 1975 - 15 Dec. 1978
Lit S. Han, Wesley R. Cox, and Arnon Chait Aug. 1979 273 p refs
(Contract F33615-75-C-2052; AF Proj. 3066)
(AD-A075501; OSURF/760256/784174; AFAPL-TR-79-2011) Avail: NTIS HC A12/MF A01 CSCL 20/4

Smoke flow visualization, hot-wire anemometer, and pressure distribution studies were conducted to determine some of the wake and pressure surface boundary layer transition region characteristics along an enlarged two-dimensional turbine airfoil model in cascade. Smooth surface as well as rough surface airfoils were used in the study, which utilized a continuous, subsonic, specially built wind-tunnel. The flow provided a range of blade chord Reynolds numbers from 7.9E - 5 1.5E - 6 at turbulence levels of 0.6 to 0.8%. A pressure surface transition region was found to exist from about S/C = 0.43 to the trailing edge for the smooth surface airfoil, and up to S/C = 0.1 for a rough surface airfoil. The transition region for a smooth surface was initiated through the formation of Goertler vortices which were found to break down through the action of traveling Tollmein-Schlichting waves. Other phenomena observed include various trailing edge vortex formations which may be linked to the intermittency of the boundary layer near the trailing edge, and a low frequency traveling wave formed in conjunction with the appearance of traveling waves. An empirical relationship was developed for the traveling wave frequency. Comparison was made with stability theory and empirical methods of predicting transition. Linear stability theory was found to predict the Goertler wavelength, but not that of the traveling waves. GRA

AN INVESTIGATION OF F-16 NOZZLE-AFTERBODY FORCES AT TRANSONIC MACH NUMBERS WITH EMPHASIS ON SUPPORT SYSTEM INTERFERENCE Final Report, Jan. - Jul. 1978
Earl A. Price, Jr. AEDC Dec. 1979 207 p refs Sponsored by the Air Force
(AD-A078693; AEDC-TR-79-56; AFAPL-TR-79-2099) Avail: NTIS HC A10/MF A01 CSCL 20/4

A comprehensive experimental program was conducted to provide nozzle-afterbody data with a minimum interference support system on a 1/9-scale F-16 model and to determine the interference induced on the afterbody-nozzle region by a sting, a wingtip, and a strut model support system. The investigation was conducted over the Mach number range from 0.6 to 1.5 and at angles of attack from 0 to 9 deg. Interference was evaluated by comparison of nozzle-afterbody axial and normal forces obtained from integrating pressure data. The results include parametric

studies of the effects of various components of the wingtip support system (i.e., the support blade axial position, wingtip boom diameter, boom spacing, and boom-tip axial location). High-pressure air at ambient temperature was utilized for exhaust plume simulation. The results indicate that a sting support passing through the nozzle with the jet effects simulated by an annular jet appears to offer a minimum interference support system for the type of nozzle-afterbody test described in this report. THRUST AUGMENTED SPIN RECOVERY DEVICE Patent Application
Bobby L. Berrier, inventor (to NASA). Filed 27 Apr. 1979. 15 p.
(NASA-Case-LAR-11970-2; US-Patent-Appl-SN-034104) Avail: NTIS HC A02/MF A01 CSCL 01C

A lightweight and drag-free yaw control system developed for a jet propelled aircraft is described. Emphasis is placed on providing aircraft attitude control at low flight speeds, at high angles of attack, and during spin. The control system is comprised of a vertical tail with a thrust augmented rudder and a thrust rudder tab. The jet exhaust stream is deflected by the thrust vectoring rudder tab in a sideward direction to the aircraft, producing a thrust vectored yawing moment and creating supercirculation about the vertical tail and thrust augmented rudder. Supercirculation, a thrust-induced aerodynamic phenomenon, generates lift without increasing drag, enabling the rudder to provide additional yawing force for attitude control. J.M.S.

UNSTEADY EFFECTS WITH CONTROL SURFACES [EFFETS INSTATIONNAIRES DES GOUVERNES]
Richard Grenon and Andre Desopper. Assoc. Aeron. et Astronautique de France. 1979. 14 p. refs. In FRENCH. Presented at 15th Colloq. d'Aerodyn. Appl., Marseille, 7-9 Nov. 1978.
(AAAF-NT-79-01; ISBN-2-7170-0528-5) Avail: NTIS HC A02/MF A01; CEDOCAR; Paris FF 17 (France and EEC) FF 21 (others)

The unsteady phenomena observable around control surfaces in subsonic and transonic flow is discussed. Results obtained with an airfoil profile equipped with a trailing edge flap moving sinusoidally in a two dimensional subsonic or transonic flow regime are reported. Steady and unsteady pressure measurements made during wind tunnel tests are given. A comparison is made between these measurements and results for the steady and unsteady flow field of a perfect fluid. An attempt is made to take into consideration viscous effects. Results show that theory does not satisfactorily describe coupling phenomena, notably flow separation and the interaction between the shock front and the boundary layer. Author (ESA)

ROTORS IN FORWARD FLIGHT AND DYNAMIC STALL [PALE RECULANTE ET DECROCHAGE DYNAMIQUE]
J. Renaud. Paris Assoc. Aeron. et Astronique de France. 1979. 26 p. refs. In FRENCH. Presented at 15th Colloq. d'Aerodyn. Appl., Marseille, 7-9 Nov. 1978.
(AAAF-NT-79-20; ISBN-2-7170-0547-1) Avail: NTIS HC A03/MF A01; CEDOCAR, Paris FF 17 (France and EEC) FF 21 (others)

Dynamic stall of rotors in forward flight is studied in terms of the limiting on helicopter performance. Manifestations of the phenomena depend on the characteristics of the rotors and on operating conditions. The lift of the rotor, forward velocity, engine speed, and the interaction of vortices with the blade surface all contribute to the development of stall. Experiments demonstrating the unsteady nature of the phenomena are reported. Simulation of dynamic stall phenomena on an oscillating model shows that the delay in unsteady stalling is associated with the development of a system of vortices along the leading edge. A two dimensional analysis is used in modeling dynamic stall. Author (ESA)

09 RESEARCH AND SUPPORT FACILITIES (AIR)

NONDESTRUCTIVE EVALUATION OF AIRPORT PAVEMENTS. VOLUME 1: PROGRAM REFERENCES
Nai C. Yang. Sep. 1979. 173 p.
(Contract DOT-FA77WA-3964)
(AD-A078835; FAA-RD-78-154-1) Avail: NTIS HC A08/MF A01 CSCL 13/2

The concept of nondestructive evaluation and functional pavement design was integrated into a computer program which is described. The program logic and operational procedures used in the computer program are outlined as follows. The nondestructive test (NDT) is used as a substitute for the plate load test without interference to airport operation. The evaluation and design segment evaluates the strength by cumulative stress damage and progressive surface deformation. The final program output is the cost information for ten design alternatives of equal functional performance. The validation program makes the correlations between the NDT data and subgrage geology, regional climate, airport operation, existing pavements, and response of airport bridges. A.W.H.

PROGRAMS FOR THE TRANSONIC WIND TUNNEL DATA PROCESSING INSTALLATION. PART 7: EXTENDED FOCAL
N. Pollock Mar. 1979 44 p refs
(AD-A073414; ARL/Aero-TM-314) Avail: NTIS HC A03/MF A01 CSCL 09/2

Since the transonic wind tunnel data processing installation, which is based on a PDP 8-I computer, was installed in 1968 a considerable library of standard programs have been produced. This program library covers all types of testing commonly carried out in the wind tunnel. However there remains the possibility of unusual tests being required which are not covered by existing programs. This memorandum describes modifications to the Digital Equipment Corporation FOCAL language (FOCAL is a keyboard oriented interpretive language similar to BASIC) which permit the tunnel instrumentation, display and plotter to be operated by FOCAL programs. Using this extended FOCAL language it should be possible to rapidly write and de-bug programs to meet unusual requirements not covered by the standard program library. GRA

METHODOLOGY FOR MAKING A SELF-ABSORPTION CORRECTION TO THE SIMPLE COPPER-LINE-RATIO TECHNIQUE USED FOR ARC-TUNNEL ENTHALPY MEASUREMENTS Final Report, Oct. 1977 - Oct. 1978
Anthony A. Boiarski Oct. 1979 77 p refs
(Contract F33615-76-C-3145; AF Proj. 2404)
(AD-A078686; AFFDL-TR-79-3122) Avail: NTIS HC A05/MF A01 CSCL 20/13

Detailed theory and analytical procedures are presented which provide a method for self-absorption correction of the simple 5106/5153 angstrom copper-line-ratio technique used to measure arc-tunnel stagnation enthalpy. This correction procedure involves simultaneous measurement of the 5106 angstrom line full half-width in order to infer copper number density and gas temperature from the self-absorption broadened line profile shape, and the simple one intensity ratio. Theoretical formulations of other dominant line-broadening contributions (i.e., Doppler, Van der Waals, and Stark effects) are also included in order to accurately determine the degree of line broadening that results from self-absorption alone. Typical data reduction curves are presented to demonstrate the correction process. These curves indicate that large errors in measured enthalpy could result if self-absorption was not properly accounted for in the data analysis procedure. An error estimate is also included to indicate the typical accuracy presently obtainable from this self-absorption correction method. GRA

TECHNOLOGY FOR LARGE SPACE SYSTEMS. A SPECIAL BIBLIOGRAPHY WITH INDEXES, SUPPLEMENT 2
20 Mar. 1980 106 p
(NASA-SP-7046(02)) Avail: NTIS HC A06 CSCL 22A

This bibliography lists 258 reports, articles, and other documents introduced into the NASA scientific and technical information system between July 1, 1979 and December 31, 1979. Its purpose is to provide helpful information to the researcher, manager, and designer in technology development and mission design in the area of the Large Space Systems Technology (LSST) Program. Subject matter is grouped according to systems, interactive analysis and design, structural concepts, control systems, electronics, advanced materials, assembly concepts, propulsion, solar power satellite systems, and flight experiments. CONTROL NETWORKS FOR THE GALILEAN SATELLITES, NOVEMBER 1979
Merton E. Davies, Thomas A. Hauge, Frank Y. Katayama, and James A. Roth Nov. 1979 70 p refs
(Contracts NASw-3210; JPL-953613)
(NASA-CR-162799; R-2532-JPL/NASA;
ISBN-0-8330-0197-3) Avail: NTIS HC A04/MF A01 CSCL 22A

Pictures of the four Galilean satellites taken as the two Voyager spacecraft approached Jupiter during March and July 1979 are presented. Control nets of the Galilean satellites, computed photogrammetrically, and measurements of the mean radii are presented. The pictures in the control nets are identified, the coordinates of the control points are given, and identifications of some of the control points are shown on figures. The use of star field pictures to compute the focal lengths of the camera is discussed and the geometric relationship between the narrow and wide and angle cameras is reported. A description of the coordinate systems of the Galilean satellites is presented and the status of the control net computations is reported. A.W.H.

ESTIMATING THE ANGULAR POSITION OF A MOVING DEEP SPACE VEHICLE USING TWO ROTATING TRACKING STATIONS **c13**
H. H. Tan *In its* The Deep Space Network 15 Feb. 1980 p 15-29 refs (For primary document see N80-18058 09-12)
Avail: NTIS HC A07/MF A01 CSCL 22A

The problem of estimating the angular position of a deep space vehicle moving at a constant velocity using two rotating tracking stations is considered. The optimal attainable estimation performance and associated receiver design are included. Parametric dependence of the optimum attainable estimation performance is also studied. J.M.S.

N80-18065*# Jet Propulsion Lab., California Inst. of Tech., Pasadena.
VALIDATION OF ROUNDTRIP CHARGED-PARTICLE CALIBRATIONS DERIVED FROM S- AND X-BAND DOPPLER VIA DRVID MEASUREMENTS **c32**
D. W. Green *In its* The Deep Space Network 15 Feb. 1980 p 30-40 refs (For primary document see N80-18058 09-12)
Avail: NTIS HC A07/MF A01 CSCL 20N

It is shown that roundtrip signal path calibrations for charged particle effects can be computed from S- and X-band Doppler data. The method by which this is done is described, and possible error sources are examined. It is shown that roundtrip calibrations computed from S- and X-band Doppler compare to direct measurements using DRVID to within the DRVID data noise. J.M.S.

N80-18066*# Jet Propulsion Lab., California Inst. of Tech., Pasadena.
OPERATION OF JOULE-THOMPSON REFRIGERATION ABOVE THE CRITICAL PRESSURE OF HELIUM **c31**
D. L. Johnson *In its* The Deep Space Network 15 Feb. 1980 p 41-49 refs (For primary document see N80-18058 09-12)
Avail: NTIS HC A07/MF A01 CSCL 20L

The refrigeration capacity of an existing refrigeration system was measured as a function of the supply pressure and the return pressure in the Joule-Thomson circuit. The performance of the refrigerator was calculated and compared to the ideal Carnot cycle refrigerator. K.L.

N80-18067*# Jet Propulsion Lab., California Inst. of Tech., Pasadena.
FEASIBILITY STUDY OF A SPACECRAFT SURVEILLANCE SYSTEM **c14**
C. A. Greenhall *In its* The Deep Space Network 15 Feb. 1980 p 50-62 refs (For primary document see N80-18058 09-12)
Avail: NTIS HC A07/MF A01 CSCL 14B

The system for monitoring the health of the proposed International Comet Exploration spacecraft during its solar electric propulsion stage cruise mode is discussed. The system uses a commerical fast Fourier transform spectrum analyzer for noncoherent, synchronous detection of an alternating-tone signal received by a small parabolic antenna (0.8 to 3 m in diameter). Integration times vary from 3.7 to 9.5 min. K.L.

N80-18068*# Jet Propulsion Lab., California Inst. of Tech., Pasadena.
THE PRACTICAL LIMITS OF PHOTON COMMUNICATION **c32**
R. J. McEliece, E. R. Rodemich, and A. L. Rubin *In its* The Deep Space Network 15 Feb. 1980 p 63-67 refs (For primary document see N80-18058 09-12)
Avail: NTIS HC A07/MF A01 CSCL 17B

It is shown that for photon communication, the rate R sub o = 1 nat per photon is the rate beyond which an explosive increase is encountered in the required ratio of peak-to-average signal power and in the required bandwidth expansion. On the basis of these results, it is conjectured that no practical photon communication system can be designed to operate above 10 nats per photon. K.L.

N80-18069*# Jet Propulsion Lab., California Inst. of Tech., Pasadena.
AN EVALUATION CRITERIA MODEL FOR THE NAVIGATION NETWORK SYSTEM DESIGN **c04**
In its The Deep Space Network 15 Feb. 1980 p 68-78 (For primary document see N80-18058 09-12)
Avail: NTIS HC A07/MF A01

The approaches used in developing the basis for a system design evaluation model are described. Two evaluation cases are modeled, leading to a general model that is then detailed for application specifically to the Navigation Network conceptual designs. The identification of the system attributes and their associated perspectives are discussed along with the method of scoring and ranking a candidate design. K.L.

N80-18070*# Jet Propulsion Lab., California Inst. of Tech., Pasadena.
TROPOSPHERIC PATH LENGTH FLUCTUATION IN TEMPERATE SEMIARID LOCALES: APPLICATION TO THE GRAVITATIONAL WAVE DETECTION EXPERIMENT **c46**
A. L. Berman and S. D. Slobin *In its* The Deep Space Network 15 Feb. 1980 p 79-85 refs (For primary document see N80-18058 09-12)
Avail: NTIS HC A07/MF A01 CSCL 04A

Radiosonde data from Edwards Air Force Base and radio metric scintillation data collected over a long, nearly horizontal path in Hawaii investigated. Utilizing a hypothesis that wet tropospheric path length fluctuation is proportional to total wet tropospheric signal delay, the two types of data are shown to be in reasonable agreement for averagings times (tau sub a) of approximately 3000 seconds. The two-way modeled tropospheric fractional frequency fluctuation at tau sub a = 1000 seconds is 1.6 x 10 to the 14th power. K.L.

PRELIMINARY TELEMETRY OPERATIONS EXPERIENCE WITH THE REAL-TIME COMBINER, 1 NOVEMBER 1978 TO 1 NOVEMBER 1979 **c17**
N. K. Simon and C. Hoynes *In its* The Deep Space Network 15 Feb

1980 p 90-96 ref (For primary document see N80-18058 09-12)
Avail: NTIS HC A07/MF A01 CSCL 09F

A prototype version of a two station, real time signal combiner was installed at Goldstone DSS 14/(12) and used to support the Voyager Mission at Jupiter and the Pioneer 11 Mission at Saturn. Early combined station operating experience with a real Time Combiner in the loop is reported. K.L.

N80-18073*# Jet Propulsion Lab., California Inst. of Tech., Pasadena.
VITERBI DECODING MODIFIED FOR SOURCES WITH MEMORY **c32**
V. Kopwar *In its* The Deep Space Network 15 Feb. 1980 p 97-110 refs (For primary document see N80-18058 09-12)
Avail: NTIS HC A07/MF A01 CSCL 17B

The gain in signal to noise ratio realized using redundancies inherent in TV data to modify the decoding metric of the DSN Viterbi decoders is investigated. This modification takes into account the memory in a TV scan line to change the transition probabilities as originally computed using independent data. The resulting data rate gain or error probability decrease is achieved without requiring any spacecraft modifications or additions. A preliminary examination of this concept on a binary symmetric channel using a simplified Markov source model involving two-level or hard-clipped TV demonstrates that very substantial decreases in error probability may be achieved. K.L.

ORBITAL REFILL OF PROPULSION VEHICLE TANKAGE
F. Merino, J. Risberg, and M. Hill Feb. 1980 256 p
(Contract NAS3-21360)
(NASA-CR-159722; GDC-CRAD-80-001) Avail: NTIS HC A12/MF A01 CSCL 22A

Techniques for orbital refueling of space based vehicles were developed and experimental programs to verify these techniques were identified. Orbital refueling operations were developed for two cryogenic orbital transfer vehicles (OTV's) and an Earth storable low thrust liquid propellant vehicle. Refueling operations were performed assuming an orbiter tanker for near term missions and an orbital depot. Analyses were conducted using liquid hydrogen and N2O4. The influence of a pressurization system and acquisition device on operations was also considered. Analyses showed that vehicle refill operations will be more difficult with a cryogen than with an earth storable. The major elements of a successful refill with cryogens include tank prechill and fill. Propellant quantities expended for tank prechill appear to to insignificant. Techniques were identified to avoid loss of liquid or excessive tank pressures during refill. It was determined that refill operations will be similar whether or not an orbiter tanker or orbital depot is available. Modeling analyses were performed for prechill and fill tests to be conducted assuming the Spacelab as a test bed, and a 1/10 scale model OTV (with LN2 as a test fluid) as an experimental package. R.C.T.

N80-18077# European Space Operations Center, Darmstadt (West Germany). Operations Dept.
GEOS-2: REPORT ON THE FIRST SIX MONTHS OF ROUTINE OPERATIONS
Paris ESA Jun. 1979 69 p refs
Avail: NTIS HC A04/MF A01

The European Space Operations Center operational support and the onboard performance are summarized. Experiments performed daily are discussed and the satellite positions and maneuvers performed are described. Special experiment operations including balloon and rocket campaigns, (Porcupine, Substrom), a lithium release operation, and measurements along geomagnetic field lines are reported. An anomaly which occurred due to a failure in the solar array causing damage to some experiments is discussed. Author (ESA)

MODIFLY: A MODULAR MULTI-DEGREE-OF-FREEDOM TRAJECTORY PROGRAM Final Report
John E. Holmes 1 Mar. 1979 127 p
(AD-A073901; NSWC/WOL/TR-78-59) Avail: NTIS HC A07/MF A01 CSCL 16/2

MODIFLY is a modular trajectory simulation computer program which was written so as to be effective, efficient, and easily modified. The program was designed primarily for the simulation of typical autonomous guided missiles in which roughly equal consideration is given to the simulations of the seekers, guidance, autopilot, controls, and aerodynamics. It was written in FORTRAN IV language for use on a CDC 6500 computer and uses overlay files and a library edit routine. GRA

MODULAR DIGITAL MISSILE GUIDANCE Technical Report, 1 Jan. - 31 Dec. 1977
Frank J. Langley, A. J. Mannion, K. D. Laube, J. Demetrick, and D. S. Goldstein 14 Dec. 1979 288 p refs
(Contract N00014-75-C-0549)
(AD-A078808; BR-11344; ONR-CR-233-052-4) Avail: NTIS HC A13/MF A01 CSCL 17/7

A set of macromodular microcomputer specifications has been prepared to meet a wide range of missile guidance and control requirements. These specifications define the function performance and interface requirements of each microcomputer module, i.e., microprocessor, memory and input-output I/O interface for analog and serial digital I/O, such that device technology improvements can continually be accommodated within the bounds of module function performance and interface requirements. To ensure such flexibility in design, other alternative device technologies were reviewed and evaluated for the MIL-STD-4553A serial digital I/O interface and the spectrum analyzer module, viz: fiber-optic data link and charge-coupled device, (CCD), very-large-scale integration (VLSI) analyzer options. In addition, the requirements for universal microcomputer development systems were explored in order to support both medium-speed single-chip microprocessors and high-speed bit-slice emulators to preserve software commonality. Lastly, the compatibility of the Navy AN/UYK-30 microprocessor with the macromodular microcomputer family was investigated on the basis of throughput and electrical interface. In summary, this phase of the program has culminated in the generation of a practical set of microcomputer module specifications for multi-source procurement. GRA

KINETIC MODEL FOR A PURPOSE CARRYING TARGET FINDING AIR DEFENSE MISSILE (KINM) [KINEMATISK MODELL FOER SYFTBAERINGSMAALSOEKANDE LUFTVAARNSROBOT (KINM)]
Goeran Lyman and Inga Nordstroem Jul. 1979 45 p refs In SWEDISH
(FOA-C-20315-E3) Avail: NTIS HC A03/MF A01

A mathematical model for the trajectory of a purpose carrying target seeking air defense missile, launched against a moving target is described. The model is three dimensional, but the target can only have one arbitrary direction, with constant load factor. The kinetic trajectory of the missile is integrated from the thrust diagram and air resistance. The variation of air density and speed of sound with height was taken into account. The program was implemented for a DEC-10 computer. Author (ESA)

SPACE SHUTTLE 1980
Washington GPO 1980 599 p Status Rept. for Comm. on Sci. and Technol., 96th Congr., 2d Sess., Jan. 1980
(GPO-55-916) Avail: SOD HC

The space shuttle program cost, performance, and schedules were reviewed for 1980. As a result of NASA's financial and schedule assessment of the shuttle program for 1980, a need for a supplemental budget request was identified. A brief description of the space shuttle program is provided, and major issues are identified for the FY 1980 supplemental budget request, and the FY budget. F.O.S.

PROGRAM DOCUMENTATION FOR THE DATA NOISING PROGRAM
M. T. Nguyen. Jun. 1979 44 p
(Contract NAS9-15800)
(NASA-CR-160534; JSC-14807; LEC-13266) Avail: NTIS HC A03/MF A01 CSCL 05B

Problems in the Space Shuttle aerodynamic data that are expected to occur in the actual Orbital Flight Test (OFT) flight data are introduced. The user selects from 1 to 100 channels to be operated on by this program. For each selected channel number, the user may introduce up to three problems in the channel data: time skew, data noise in the frequency domain, and data-quantization. The output data is the input data plus the data for each selected channel number with NOISE selected by the program user. M.M.M.

NASCAP MODELLING COMPUTATIONS ON LARGE OPTICS SPACECRAFT IN GEOSYNCHRONOUS SUBSTORM ENVIRONMENTS
N. John Stevens and Carolyn K. Purvis 1980 20 p refs Presented at Soc. of Photo-Optical Instrumentation Engineers, Los Angeles Technical Symp., North Hollywood, Calif., 4-7 Feb. 1980
(NASA-TM-81395; E-305) Avail: NTIS HC A02/MF A01 CSCL 22B

The NASA Charging Analyzer Program (NASCAP) is used to evaluate qualitatively the possibility of such enhanced spacecraft contamination on a conceptual version of a large satellite. The evaluation is made by computing surface voltages on the satellite due to encounters with substorm environments and then computing charged particle trajectories in the electric fields around the satellite. Particular attention is paid to the possibility of contaminants reaching a mirror surface inside a dielectric tube because this mirror represents a shielded optical surface in the satellite model used. Deposition of low energy charged particles from other parts of the spacecraft onto the mirror was found to be possible in the assumed moderate substorm environment condition. In the assumed severe substorm environment condition, however, voltage build up on the inside and edges of the dielectric tube in which the mirror is located prevents contaminants from reaching the mirror surface. PRESSURE LIMITING PROPELLANT ACTUATING SYSTEM Patent
Paul B. Reese (Rockwell International Corp., Downey, Calif.) and David W. Murphy, inventors (to NASA) (Rockwell International Corp., Downey, Calif.) Issued 15 Jan. 1980 4 p Filed 4 Aug. 1978 Supersedes N78-31162 (16 - 22, p 2906)
(NASA-Case-MSC-18179-1; US-Patent-4,183,217; US-Patent-Appl-SN-931218; US-Patent-Class-60-632) Avail: US Patent and Trademark Office CSCL 21H

A pressure limiting propellant activating system for simultaneously limiting the output force while maintaining a constant output pressure from the combustion chamber is described. The propellant actuated system includes an outer barrel, outer housing and a combustion chamber. A main piston is movable in the barrel housing when gas pressure is developed in the combustion chamber. A relief piston is concentrically mounted and fixedly movable with the main piston when gas pressure is exerted from the combustion. A relief piston has a force-activated separation mechanism for limiting the output force while simultaneously maintaining constant output pressure on the main piston from the combustion chamber.

ECONOMIC ANALYSIS OF THE DESIGN AND FABRICATION OF A SPACE QUALIFIED POWER SYSTEM

Gregory Ruselowski Jan. 1980 25 p refs
(NASA-TM-81418; E-339) Avail: NTIS HC A02/MF A01 CSCL 10B

An economic analysis was performed to determine the cost of the design and fabrication of a low Earth orbit, 2 kW photovoltaic/battery, space qualified power system. A commercially available computer program called PRICE (programmed review of information for costing and evaluation) was used to conduct the analysis. The sensitivity of the various cost factors to the assumptions used is discussed. Total cost of the power system was found to be $2.46 million with the solar array accounting for 70.5%. Using the assumption that the prototype becomes the flight system, 77.3% of the total cost is associated with manufacturing. Results will be used to establish whether the cost of space qualified hardware can be reduced by the incorporation of commercial design, fabrication, and quality assurance methods. J.M.S.

APPLICATION OF A GRAPHITE FURNACE ATOMIC ABSORPTION DETECTOR AUTOMATICALLY COUPLED TO HPLC FOR SPECIATION OF METAL-CONTAINING MACROMOLECULES Interim Report
E. J. Parks, F. E. Brinckman, and W. R. Blair May 1979 31 p refs Presented at the Intern. Symp. on Column Liquid Chromatography, Boston, 7-10 May 1979 Submitted for publication
(NR Proj. 356-689)
(AD-A077321) Avail: NTIS HC A03/MF A01 CSCL 07/3

High pressure liquid chormatography (HPLC) coupled with graphite furnace atomic absorption (GFAA) is capable of sensitive, nearly non-destructive, element-specific separation and detection of a wide range of molecular species containing metals or metalloids. Applications of HPLC-GFAA techniques are discussed, including size exclusion chromatography (SEC) for the analysis of experimental organometallic polymers containing chemically bonded biocidal organotin moieties, and reverse bonded phase (RBP) chromatogrphy for analysis of novel organotin silicates. In conjunction with variably sensitive optical RI/UV detection, GFAA demonstrates separation of the polymers into a least two tin-containing fractions of widely different molecular weight (MW). The relative proportions of high and low MW fractions have important implication with respect to performance specifications for these and similar controlled release materials. Tin-specific and silicon-specific analysis of an organotin silicate demonstrates co-elution of species containing each element. Future off/online Si29 and Sn119 FT-NMR will demonstrate whether each element is bonded to the same molecular species. GRA

24 COMPOSITE MATERIALS

PLASTIC ANALYSIS OF METAL-MATRIX COMPOSITE LAMINATES Ph.D. Thesis
Yehia Ahmed Bahei-El-Din 1979 273 p
Avail: Univ. Microfilms Order No. 8003814

The development of phenomenological materials models for elastic-plastic fibrous composites is described with emphasis on a continuum model which represents the mechanical properties of the constituents and the essential features of their mutual constraints. Such a material model is developed, and constitutive equations describing hardening and flow rules are derived. Evaluation of the model is made in regard to the application of fibrous metal-matrix composites in laminated plates. The capability of the material model and the finite element method in describing the behavior of composite structures was demonstrated in evaluating both the overall response and the plastic yielding of laminated plates with discontinuities, such as holes and notches. Dissert. Abstr.

ADVANCED COMPOSITE AILERON FOR L-1011 TRANSPORT AIRCRAFT Quarterly Technical Report, 22 Dec. 1973 - 24 Mar. 1978
14 Apr. 1978 54 p refs
(Contract NAS1-15069)
(NASA-CR-162863; LR-28559; DLR-003; QTR-2) Avail: NTIS HC A04/MF A01 CSCL 11D

Design and evaluation of alternate concepts for the major subcomponents of the advanced composite aileron (ACA) was completed. From this array of subcomponents, aileron assemblies were formulated and evaluated. Based on these analyses a multirib assembly with graphite tape/syntactic core covers, a graphite tape front spar, and a graphite fabric rib was selected for development. A weight savings of 29.1 percent (40.8 pounds per aileron) is predicted. Engineering cost analyses indicate that the production cost of the ACA will be 7.3 percent less than the current aluminum aileron. Fabrication, machining, and testing of the material evaluation specimens for the resin screening program was completed. The test results lead to the selection of Narmco 5208 resin for the ACA. Other activities completed include: the detailed design of the ACA, construction of a three dimensional finite element model for structural analysis, and formulation of detail plans for material verification and process development. R.E.S.

ADVANCED MANUFACTURING DEVELOPMENT OF A COMPOSITE EMPENNAGE COMPONENT FOR L-1011 AIRCRAFT Quarterly Technical Report, 1 Jan. 1978 - 31 Mar. 1978

14 Apr. 1978 130 p
(Contract NAS1-14000)
(NASA-CR-162862; LR-28573; DLR-003; QTR-9) Avail: NTIS HC A07/MF A01 CSCL 11D

Tooling concepts were developed which would permit co-couring of the hat stiffeners to the skin to form the cover assembly in a single autoclave cycle. These tooling concepts include the use of solid rubber mandrels, foam mandrels, and formed elastometric bladders. A simplification of the root end design of the cover hat stiffeners was accomplished in order to facilitate fabrication. The conversion of the 3D NASTRAN model from level 15 to level 16 was completed and a successful check run accomplished. A detailed analysis of the thermal load requirement for the environmental chambers was carried out. Based on the thermal analysis, best function requirements, load inputs and ease of access, a system involving four chambers, two for the covers containing 6 and 4 specimens, respectively, and two for the spares containing 6 and 4 specimens, respectively, evolved. R.E.S.

N80-18106*# National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.
A SMALL-SCALE TEST FOR FIBER RELEASE FROM CARBON COMPOSITES
W. J. Gilwee, Jr. and R. H. Fish Feb. 1980 9 p refs Presented at Conf. on Advanced Composites, Special Topics, El Segundo, Calif., 4-6 Dec. 1979
(NASA-TM-81179; A-7962) Avail: NTIS HC A02/MF A01 CSCL 11D

A test method was developed to determine relative fiber loss from pyrolyzed composites with different resins and fiber construction. Eleven composites consisting of woven and unwoven carbon fiber reinforcement and different resins were subjected to the burn and impact test device. The composites made with undirectional tape had higher fiber loss than those with woven fabric. Also, the fiber loss was inversely proportional to the char yield of the resin. K.L.

APPLICATION OF COMPOSITE MATERIALS TO TURBOFAN ENGINE FAN EXIT GUIDE VANES
G. T. Smith 1980 19 p refs Presented at 35th Ann. Conf. of the Reinforced Plastics/Composite Inst., New Orleans, 4-8 Feb. 1980; sponsored by Soc. of Plastics Industries
(NASA-TM-81432; E-356) Avail: NTIS HC A02/MF A01 CSCL 11D

A program was conducted by NASA with the JT9D engine manufacturer to develop a lightweight, cost effective, composite material fan exit guide vane design having satisfactory structural durability for commerical engine use. Based on the results of a previous company supported program, eight graphite/epoxy and graphite-glass/epoxy guide vane designs were evaluated and four were selected for fabrication and testing. Two commercial fabricators each fabricated 13 vanes. Fatigue tests were used to qualify the selected design configurations under nominally dry, 38 C (100 F) and fully wet and 60 C (140 F) environmental conditions. Cost estimates for a production rate of 1000 vanes per month ranged from 1.7 to 2.6 times the cost of an all aluminum vane. This cost is 50 to 80 percent less than the initial program target cost ratio which was 3 times the cost of an aluminum vane. Application to the JT9D commercial engine is projected to provide a weight savings of 236 N (53 lb) per engine. Author

FIRE TEST METHOD FOR GRAPHITE FIBER REINFORCED PLASTICS
Kenneth J. Bowles 1980 13 p refs Presented at 5th Intern. Conf. on Fire Safety, Millbrae, Calif., 14-18 Jan. 1980
(NASA-TM-81438; E-360) Avail: NTIS HC A02/MF A01 CSCL 11D

A potential problem in the use of graphite fiber reinforced resin matrix composites is the dispersal of graphite fibers during accidental fires. Airborne electrically conductive fibers originating from the burning composites could enter and cause shorting in electrical equipment located in surrounding areas. A test method for assessing the burning characteristics of graphite fiber reinforced composites and the effectiveness of the composites in retaining the graphite fibers has been developed. The method utilizes a modified rate of heat release apparatus. The equipment and the testing procedure are described. The application of the test method to the assessment of composite materials is illustrated for two resin matrix/graphite composite systems. A.R.H.

THE POTENTIAL FOR DAMAGE FROM THE ACCIDENTAL RELEASE OF CONDUCTIVE CARBON FIBERS FROM BURNING COMPOSITES
Vernon L. Bell Apr. 1980 23 p refs Proposed for presentation at the AGARD Structures and Materials Panel Specialist's Meeting of Effect of Service Environment on Composite Materials, Athens, Greece, 16 Apr. 1980
(NASA-TM-80213) Avail: NTIS HC A02/MF A01 CSCL 11D

The potential damage to electrical equipment caused by the release of carbon fibers from burning commercial airliners is assessed in terms of annual expected costs and maximum losses at low probabilities of occurrence. A materials research program to provide alternate or modified composite materials for aircraft structures is reviewed. K.L.

N80-18109*# National Aeronautics and Space Administration. Langley Research Center, Langley Station, Va.
COMPOSITE COMPONENTS ON COMMERCIAL AIRCRAFT
H. Benson Dexter Mar. 1980 24 p refs To be presented at the AGARD Specialist Meeting on Effect of Service Environ. on Composite Mater., Athens, 13-18 Apr. 1980
(NASA-TM-80231) Avail: NTIS HC A02/MF A01 CSCL 11D

Commercial aircraft manufacturers are making production commitments to composite structure for future aircraft and modifications to current production aircraft. Flight service programs with advanced composites sponsored by NASA during the past 10 years are described. Approximately 2.5 million total composite component flight hours have been accumulated since 1970 on both commercial transports and helicopters. Design concepts with significant mass savings were developed, appropriate inspection and maintenance procedures were established, and satisfactory service was achieved for the various composite components. A major NASA/U.S. industry technology program to reduce fuel consumption of commercial transport aircraft through the use of advanced composites was undertaken. Ground and flight environmental effects on the composite materials used in the flight service programs supplement the flight service evaluation. A.R.H.

Avail: NTIS HC A03/MF A01 CSCL 11/4

A two-dimensional, generalized plane strain, finite element analysis of the stress states in the individual fibers and surrounding matrix of a unidirectionally reinforced composite material was developed. The fibers are modeled as elastic but anisotropic; the matrix is modeled as isotropic, but elastoplastic. Thermal and moisture absorption histories as well as temperature - and moisture-dependent material properties are included. A complete finite element computer program, an associated plot package, and extensive numerical results are available. Experimental work was conducted using unreinforced (neat resin), castings of Hercules 3501-6 epoxy matrix, as well as AS/3501-6 graphite/epoxy matrix, and S2/3501-6 glass/epoxy unidirectional composites. Axial and transverse tensile tests as well as torsional shear tests were performed, under various temperatures and moisture conditions. Experimental results and comparisons with micromechanics predictions are summarized, with references given to

various conference and journal publications for detailed information. GRA

(AD-A078429; AFOSR-79-1241TR) Avail: NTIS
HC A03/MF A01 CSCL 20/11

This report describes experimental and analytical investigations in the area of wear of materials under repetitive compound impact. A reciprocating apparatus which provides controlled, repeatable, measureable impulsive loads between specimen and counterface has been employed in wear testing. Specimen materials in previous experimentation include polymers, composites, and several alloys. That reported herein focuses upon titanium alloys, metallic composites, and copper-chromium alloys. The formation of subsurface zones occurring in impact wear appears to be significant. Correlations between subsurface strain gradients and wear have been demonstrated. These subsurface plastic deformations are dependent upon macroscopic 'solid contact' conditions imposed during impact. Temperatures occasioned at and near the wear interface are shown locally to each level of 800C for test conditions explored. Void and crack formation in the substrate is occasionally observed, but not nearly to the extent reported for materials under conditions of sliding wear. Analytical investigations are directed toward determination of the states of stress in material specimens undergoing controlled repetitive impact. Results are derived from the equations of the linear theory of elasticity applied to a finite cylinder impacting a rough, rigid surface. GRA

ENGINEERING FEASIBILITY OF INTERNAL FRICTION DAMPING AS A NONDESTRUCTIVE EVALUATION TECHNIQUE FOR SYNTHETIC ROPES Final Report
David C. Fresch, Larry L. Yeager, and A. P. Thiruvengadam 28 Feb. 1979 229 p refs
(Contract DOT-CG-828271-A)
(AD-A078461; USCG-D-51-79) Avail: NTIS
HC A11/MF A01 CSCL 11/5

This report discusses the technical feasibility of applying an internal friction damping, nondestructive evaluation technique for synthetic ropes. Applications for synthetic ropes include mooring lines, towing hawsers and lines for single point moorings (SPM) in deep water ports (DWP). The theory of internal friction damping is presented as it has been historically applied to metallic materials. The report then discusses the methodology for application of the internal friction damping technique to synthetic rope material and construction. The experimental apparatus and specific laboratory technique as applied to six inch and eight inch circumference rope is next discussed in detail. The report then discusses the experimental results and relates the test results to feasibility of employing the test technique as a guideline device for rope deterioration/performance. The report also relates this discussion to characteristics of the ropes tested under both wet and dry conditions. The experimental results section concludes with a comparison of the effect of the internal friction damping for various synthetic rope failure mechanisms. GRA

FINAL EVALUATION OF RAIN EROSION ON SLED TEST RESULTS AT MACH 3.7 TO 5.0 FOR SLIP-CAST FUSED SILICA RADOME STRUCTURES
K. N. Letson and William G. Burleson 6 Mar. 1979 63 p refs
(AD-A077348; DRSMI-T-79-42) Avail: NTIS
HC A04/MF A01 CSCL 11/2

This report contains a summary of rain erosion results obtained for high-purity slip-cast fused silica (SCFS) models on sleds at Holloman Air Force Base, New Mexico. This effort, which was initiated to evaluate the rain erosion behavior of SCFS as a function of velocity and angle of incidence was completed with good correlation of results. The tests were performed in artificial rain at average velocities between 1270 and 1740 m/sec (Mach 3.7 and 5.0). Right circular cone models having semivertex angles of 15, 19, 22.5, 25, 27.5, and 30 degrees were tested. A special test vehicle and sample design were utilized to avoid sled vibration-induced failures that are common to small samples of brittle ceramics at velocities near Mach 5. A unique feature of the sled test vehicle is its capability of testing seven cone frusta, thereby simulating actual radome forebody shapes. The sample design and special mounting technique resulted in obtaining correlatable erosion data which were free of spurious mass losses caused by sample fracture and edge effects. Because SCFS has low fracture toughness and relatively poor rain erosion resistance under severe conditions, other candidate ceramic and plastic radome materials were tested concurrently in the interest of finding a tougher structure. However only those results for SCFS are presented in this report. GRA

INFLUENCE OF THE ORIENTATION AND THE CROSSING OF FIBERS ON THE RUPTURING OF NOTCHED CARBON FIBER/EPOXY COMPOSITE MATERIALS Final Report [INFLUENCE DE L'ORIENTATION ET DU CROISEMENT DES FIBRES SUR LA RUPTURE DES COMPOSITES FIBRES DE CARBONE-EPOXYDE ENTAILLES]
C. Bathias 29 Aug. 1978 43 p refs In FRENCH
(Contract DGRST-76-7-1017)
(PV-38.022) Avail: NTIS HC A03/MF A01

Notched specimens as well as specimens containing holes were subjected to traction loads to rupture in order to determine the influence of fiber orientation and notch or hole sensitivity on fracture strength. The mathematical tools used in the analysis along with a radiographic technique for characterizing notch damage are discussed. Results demonstrate that the presence of notches or holes equally weaken this type of composite. Crossing the reinforcing fibers at 45 deg gives better results than at 30 deg. A study of the fracture mechanisms, based on a finite element layer analysis of the damaged zone, indicates that the 'R curve' can be used to predict the fracture strength of composite plates. HIGH-PRECISION MASS SPECTROMETRIC HYDROGEN ISOTOPE RATIO MEASUREMENTS Ph.D. Thesis
David William Peterson 1979 236 p
Avail: Univ. Microfilms Order No. 8000717

The analytical capabilities of mass spectrometric ion-current measurement systems are described on both a theoretical and a practical basis. From the theoretical standpoint, a signal-to-noise ratio (S/N) model that evaluated the fundamental sources of noise present in ion-current measurement systems was developed. Use of this model accurately predicted the performance (precision) for ion-current ratio measurements made by two isotope ratio mass spectrometers, one designed for carbon isotopic measurements, and the other designed for hydrogen isotopic measurements. For the hydrogen isotope ratio mass spectrometer, the precision of a differential ratio measurement was calculated by use of the S/N model (0.26 0/00) and shown to be in good agreement with the measured precision (0.24 0/00). INELASTIC ELECTRON TUNNELING SPECTROSCOPY OF UV IRRADIATED MOLECULES Ph.D. Thesis
James Michael Clark 1979 191 p

Avail: Univ. Microfilms Order No. 8002512

Tunneling spectroscopy was applied to the study of molecular radiation damage. Purine and pyrimidine nucleotides, small peptides and substituted benzene ring compounds in monolayer coverage were irradiated with ultraviolet radiation under ultrahigh vacuum conditions. Damage to the molecules is manifested by a loss of intensity in the vibrational structure due to bond weakening or bond rupture and by an enhancement in intensity as new radiation products are formed. In a comprehensive study of nucleic acid constituents, IETS was capable of detecting subtle structural variations among compounds containing the same purine or pyrimidine base as well as distinguishing among compounds containing different bases. Spectra which can differentiate among derivatives of the purine base adenine were produced by carefully measuring the spectral region below 600 1/cm for each derivative. Dissert. Abstr.

ELECTRON PARAMAGNETIC RESONANCE STUDIES OF LOW SYMMETRY NICKEL(I) AND MOLYBDENUM (V) COMPLEXES. PART 1: COMPUTER SIMULATION OF ELECTRON PARAMAGNETIC RESONANCE SPECTRA. PART 2: ELECTRON PARAMAGNETIC RESONANCE STUDIES OF NICKEL(I) TRIPHENYLPHOSPHINE COMPLEXES. PART 3: ELECTRON PARAMAGNETIC RESONANCE STUDIES OF A MOLYBDENUM(V) THIOCYANATE COMPLEX Ph.D. Thesis
Mark Joseph Nilges 1979 201 p
Avail: Univ. Microfilms Order No. 8004241

Part 1 describes computer programs that are used to simulate single crystal and polycrystalline electronic paramagnetic resonance (EPR) spectra for S=1/2 systems with nuclear hyperfine and quadrupole interactions. The programs are applicable to low symmetry complexes and allow for the noncoincidence of different EPR tensors. Part 2 describes the successful preparation and EPR spectra of single crystals of Ni. The unusual spectral features in the EPR spectra of the complexes are explained in terms of a halogen nuclear quadrupole interaction which is competitive with the halogen superhyperfine interaction. Part 3 describes the EPR spectra of Mo-95 and Mo-97 doped single crystals of TPA2NbO(SCN)5. Dissert. Abstr.

THREE STUDIES IN THE ELECTRONIC AND VIBRATIONAL STRUCTURE OF POLYATOMIC MOLECULES. 1: THE THERMAL LENSING SPECTROMETER AND THE LOCAL MODE MODEL OF VIBRATIONAL OVERTONE SPECTRA. 2: CALCULATIONS OF SECOND ORDER HYPERPOLARIZABILITIES. 3: THE MOLECULAR STRUCTURE OF THE BENZYL RADICAL AND ITS IONS AND A PROGRAM FOR NORMAL MODE ANALYSIS Ph.D. Thesis
James Albert Morrell 1979 251 p
Avail: Univ. Microfilms Order No. 8003957

The thermal lensing absorption spectrometer was used to characteristize the C-H stretching overtones in several aromatic and aliphatic molecules. The spectra derived from different types of C-H bonds are clearly resolved, and spectral shifts are seen which arise from intermolecular perturbations of the force constants of the C-H oscillators. This absorption spectrometer was used to develop and verify the local mode model of overtone absorption spectra. In addition, the hyperpolarizability of several substituted organic systems was computed. It was found that only one charge transfer state accounts for the bulk of the nonlinearity of p-nitroaniline. A structural determination of the benzyl radical and ions revealed that the radical and the anion are planar, while the cation has C sub 3 symmetry with the CH2 group slightly out of plane. A program for the calculation of the normal modes of vibrations and harmonic vibrational energies of small molecular systems is given. Dissert. Abstr.

A MASS POINT LOCALIZED KINETIC THEORY OF FLUIDS Ph.D. Thesis
Richard Lee Hansen 1979 149 p
Avail: Univ. Microfilms Order No. 8001142

A kinetic theory of molecules with internal degrees of freedom was developed which recognizes the size and structure of the molecules involved. This was accomplished by localizing the kinetic quantities for a given mass point at the position of that mass point. The kinetic theory represents a generalization of an earlier theory to include more general potentials of intermolecular and intramolecular interaction. It is shown for the mass point localized kinetic theory that a symmetric pressure tensor results. It is also shown that an antisymmetric part to the pressure tensor is not necessary for the rotational relaxation of a rotationally excited system. A model calculation is carried out for a polymeric solution in which hydrodynamic interaction forces are included. The system considered for the model calculation is composed of a single species of polymer, modeled as an asymmetric dumbbell in a single structureless solvent. Dissert. Abstr.

N80-18121 Illinois Univ. at Urbana-Champaign.
CHEMICAL AND PHYSICAL CHARACTERIZATION OF ENVIRONMENTAL POLLUTANTS Ph.D. Thesis
Mary Myers Tucker 1979 156 p
Avail: Univ. Microfilms Order No. 8004290

A single method for the speciation of inorganic and organic mercury in natural water samples was developed. The technique specifically reduces inorganic mercury, Hg(2+), to elemental mercury by simple alkaline sodium borohydride reduction, followed by cold vapor atomic absorption detection. Total mercury, Hg(2+) and RHgX, is similarly determined following decomposition of the organic mercury by ultraviolet light. A simple particle leaching technique was developed to obtain information about physical characteristics and speciation of particle surfaces. Analysis of cumulatively collected leachate provides integral leaching curves; whereas, analysis of incrementally collected leachate provides differential leaching curves. These curves yield complementary information about the physical availability of the elements to the environment via the leaching process. Dissert. Abstr.

APPLICATIONS OF OPEN TUBULAR COLUMNS TO THE GAS CHROMATOGRAPHY OF VOLATILE METAL COMPLEXES Ph.D. Thesis
Therese Phyllis Tetu 1979 289 p
Avail: Univ. Microfilms Order No. 8004995

The chromatographic behavior of volatile metal complexes on a variety of open tubular columns was investigated. Primary interest was focussed on the tetradentate beta-ketoamine complexes of Cu(II) and Ni(II). Extensions of this work included an investigation of the behavior of several chromium (III) beta-diketonates and organometallics on these columns. Initial investigations were performed using stainless steel porous layer open tubular (PLOT) columns. The viability of glass PLOT columns for metal complex GC was also investigated. The principle column for these investigations was a non-polar OV101 PLOT column. The use of a deactivated substrate in ths case allowed the successful elution of Cu(II) and Ni(II) tetradentate beta-ketoamines possessed of various degrees thermal and chromatographic stability. Dissert. Abstr.

SEVERAL APPLICATIONS OF NONDISPERSIVE CONTINUUM SOURCE ATOMIC FLUORESCENCE SPECTROMETRY Ph.D. Thesis
Frank Lipari 1979 155 p
Avail: Univ. Microfilms Order No. 8004867

A wavelength modulated spectrometer and a continuum source atomic fluorescence system for the simultaneous multielement determination of elements that form volatile metal hydrides are discussed. Spectral selectivity, in both cases, is achieved by

the use of bandpass interference filters. The wavelength modulated spectrometer has comparable sensitivity to atomic absorption spectrometry (AAS) and was applied with good results in trace metal determinations in pooled blood serum. The atomic fluorescence system also has sensitivity comparable to AAS and was utilized in The simultaneous multielement mode for As, Sb, and Ge determinations in NBS Low Allow Steel samples. The main advantages of these instruments are that they are low cost, simple, easy to operate, free of spectral interference, and applicable to analyses in a wide variety of matrices.
Dissert. Abstr.

THE ANALYSIS AND CHARACTERIZATION OF THE URETHANE FUNCTIONAL GROUP VIA FUSION REACTION GAS CHROMATOGRAPHY Ph.D. Thesis
David George Gibian 1979 120 p
Avail: Univ. Microfilms Order No. 8004927

Fusion reaction gas chromatography was applied to the analysis and characterization of urethanes and polurethanes. It was found to be a rapid and accurate means of assaying and characterizing compounds containing the urethane functional group. The advantages of fusion reaction gas chromatography are that a one piece apparatus may be used, ensuring identical conditions for all samples. Reactions are made to go to completion. Only milligram amounts of sample are required, and the sample need not be volatile. Each component of a mixture containing the same functional group can be determined, in contrast to standard functional group methods which only give total functional group present. Matrix effects are removed and undesirable side reactions eliminated.
Dissert. Abstr.

THE APPLICATION OF CHROMATOGRAPHY AND ANCILLARY TECHNIQUES TO THE CHARACTERIZATION OF SHALE OIL/OIL SHALE COMPOUND CLASSES AND OF ORGANOMETALLICS Ph.D. Thesis
Frank Patrick DiSanzo 1979 203 p
Avail: Univ. Microfilms Order No. 8004916

Chromatography and Ancillary techniques (specific detectors and mass spectrometry) were applied to the characterization of shale oil and oil shale compound classes and of organometallics. An inexpensive and simple preparative low pressure high performance liquid chromatographic scheme was developed for shale oil hydrocarbon analysis. Activated silica and silver nitrate impregnated 32-63 micron silica was employed for the isolation of alkanes, alkenes, and aromatics. Evidence for the presence of prist-1-ene in the alkene fraction is presented. Application of on-line reactors to aid in the discrimination between various classes of hydrocarbons is also described.
Dissert. Abstr.

SOME APPLICATIONS OF NEGATIVE ION MASS SPECTROMETRY Ph.D. Thesis
Kenneth Louis Busch 1979 255 p
Avail: Univ. Microfilms Order No. 8005018

Methane or a mixture of methane and oxygen were used as moderator gases at 1 to 2 torr in a chemical ionization mass spectrometer to produce gas enhanced negative ion mass spectra. Negative ion mass spectra were compared with electron impact and methane positive chemical ionization mass spectra for organophosphorus pesticides. Polychlorinated aromatic hydrocarbons, nitriles, and organometallic compounds were also investigated. Methane enhanced negative ion mass spectrometry proved to be useful by virtue of abundant ions reflecting molecular weight, reduced fragmentations, and for those molecules with several electrophores, a sensitivity much greater than the positive ion methods.
Dissert. Abstr.

N80-18127 Princeton Univ., N. J.
APPLICATIONS OF COHERENT ANTI-STOKES RAMAN SPECTROSCOPY (CARS) Ph.D. Thesis
Gabriel Laufer 1978 148 p
Avail: Univ. Microfilms Order No. 8003791

New Coherent Anti-Stokes Raman Spectroscopy (CARS) techniques and their application to gas diagnostics and surface spectroscopy are presented. In the first experiment, hollow waveguides are shown to enhance CARS by two orders of magnitude for low pressure gases. Theoretical and experimental comparisons of signals generated by tight focusing in a cell with those generated in a hollow waveguide are presented. These arguments show that for low pressures, enhancements are on the order of the square of the waveguide length to the confocal beam parmeter ratio. In the second experiment, a new crossed beam CARS configuration is studied. This crossed beam configuration produces an angularly separated CARS spectrum, eliminating the need for a spectrometer.

CATALYSTS FOR THE OXIDATION OF CARBON MONOXIDE AT LOW TEMPERATURES Interim Report
J. K. Musick and F. W. Williams Nov. 1979 28 p refs
(S0205034)
(AD-A077323; NRL-8353) Avail: NTIS HC A03/MF A01 CSCL 07/4

Four catalysts (hopcalite, Whetlerite, a supported palladium, and a supported platinum) were tested for efficiency in promoting the oxidation of carbon monoxide (CO). At room temperature and 50% RH, hopcalite has no catalytic capability and platinum has practically none. At room temperature and 15% RH, hopcalite is superior to platinum in catalyzing the oxidation of CO. Hopcalite is more efficient than either of the other three catalysts in the 52 to 66 C (125 to 150 F) temperature range at both humidities. Platinum and palladium are superior to both hopcalite and Whetlerite at both humidities in the 113 to 135 C (235 to 275 F) temperature range. Higher humidity decreases the co-oxidizing capabilities of hopcalite and Whetlerite but does not do so for platinum and palladium. Whetlerite is in the lower-performing group of catalysts under all except one of the different conditions used in the tests. For the hopcalite, palladium, and platinum catalysts there is a temperature below 135 C (275 F) and above 68 C (155 F) at which CO can be oxidized efficiently.

AN ACCURATE MODEL FOR SAMPLE DROPLET ACCELERATION IN ANALYTICAL FLAMES Interim Report
Richard E. Russo and Gary M. Hieftje Dec. 1979 21 p refs
Submitted for publication
(Contract N00014-76-C-0838; NR Proj. 051-622)
(AD-A078655; TR-24) Avail: NTIS HC A02/MF A01 CSCL 07/4

The experimentally observed velocity of an aerosol droplet in an air-acetylene flame is compared to the velocity calculated through a new mathematical model. The experimental droplet velocity is measured by means of stroboscopic photography of a stream of individual droplets sent into a flame at a known frequency and traveling very reproducible trajectories. Because the temporal spacing between these droplets is known, a measure of the instantaneous droplet location enables their velocity to be calculated. The droplet acceleration model was modified by incorporating into it a spatially changing flame rise velocity, which was assumed constant in earlier treatments. Excellent agreement has been found between calculated and measured droplet acceleration in the flame. GRA

SYNTHETIC APPROACHES TO MIXED-VALENCE CHEMISTRY
David B. Brown and James T. Wrobleski Nov. 1979 28 p refs
(Contract N00014-75-C-0756)
(AD-A078513; TR-18) Avail: NTIS HC A03/MF A01 CSCL 07/4

Several preparative routes to mixed-valence materials have been examined and the effect of the synthetic variables discussed. It has been shown that solubility is a dominant factor in the successful isolation of many such materials. Soluble metal cluster complexes are susceptible to sequential oxidation/reduction reactions which lead to mixed-valence clusters, and the importance and utility of electrochemical measurements in the preparation and understanding of these clusters is discussed. The preparation of mixed-valence polymers by solid-state reactions and by polymer growth techniques has been examined, and the types of behavior exhibited are shown to be explicable using arguments derived from the thermodynamics of solutions. Engineering studies with catalytic combustors in the main burner and afterburner of aircraft propulsion systems have been concerned with the attainment of high combustion efficiency and flame stabilization of fuel-air mixtures outside the conventional flammability limits. The development of such devices that will perform at optimum efficiency over a broad range of operating conditions requires a detailed understanding of the flow of a reactive gas through ducts with catalytic walls, in which both hetorogeneous (wall) and homogeneous (gas) chemical reaction kinetics can occur. Of special interest to our study is the evaluation of the relative contributions of surface-catalyzed and gas-phase reactions to the total heat release rate in a catalytic combustor over a range of operating variables that include gas flow velocity, catalyst temperature, surface reactivity, and fuel-air ratio. Two catalytic combustor systems were employed. One involved stagnation point boundary layer flow with a catalytically active flat surface, the other duct flow in a multichannel catalytic monolith. The experimental studies were supplemented by theoretical calculations of heat release rates and temperature profiles based on models appropriate to the geometry and fluid dynamics of each catalytic combustion system. The result of our studies with dilute propane-air gas mixture and platinum coated surfaces have demonstrated that in both combustor configurations the gas phase combustion can be initiated by the wall-catalyzed reaction. ON THE SYNTHESIS OF METASTABLE A-15 Nb3Si BY ION IMPLANTATION AND ON ITS SUPERCONDUCTING TRANSITION TEMPERATURE
M. T. Clapp (Mass. Univ., Amherst) and Robert M. Rose Nov. 1979 26 p refs
(Contract N00014-76-C-0297)
(AD-A077396; TR-2) Avail: NTIS HC A03/MF A01 CSCL 07/2

The authors have found a new technique for the synthesis of metastable compounds of well defined composition; namely, ion implantation of a selected element into the desired crystal structure. Starting with a substrate material of A-15 Nb3Al0.9Si0.1, two basic approaches were tried towards the formation of A-15 Nb3Si by Si implantation: (1) direct replacement of the Al by Si, and (2) implantation into a surface layer depleted of Al. This later approach proved to be the most successful. It consisted of removing the Al by a diffusion anneal and replacing the Al deficiency by sequential Si implatation. Upon subsequent heat treatment, a surface layer of A-15 Nb3Al0.2Si0.8 was produced. Details of the experimental procedure and a discussion of the superconducting transistion temperature measurements of the implanted surfaces are presented. GRA

THE PHYSICAL STRUCTURE OF TURBULENT FLAMES
N. A. Chigier and A. J. Yule Jan. 1979 11 p refs Presented at the Aerospace Sci. Meeting, New Orleans, 15-17 Jan. 1979
(Grant AF-AFOSR-3414-77; AF Proj. 2308)
(AD-A070008; AFOSR-79-0656TR; PAPER-79-0217) Avail: NTIS HC A02/MF A01 CSCL 21/2

This paper reports on measurements made in the mixing region of an axisymmetric turbulent propane/air jet issuing from a round nozzle into a low-velocity, low-turbulence intensity, unconfined co-flowing airstream. The exit velocity of the jet fluid and its turbulence intensity are sufficiently low to allow the formation of ring vortices within the mixing layer, bounded, on the inside, by the potential core of the jet and, on the outside, by the secondary airstream. High speed cine films show evidence of formation of vortices and flamelets at the interfaces. The changes in shape, movement and coalescence downstream of the nozzle are examined. Measurements of fluctuating velocity are made by a single particle-counting forwardscatter laser anemometer. Fluctuating temperature is measured with microthermocouples with 'in situ' measurement of time constant and direct compensation by digital signal recording and analysis. Variation in location and amplitude of peaks of velocity and temperature traces are directly associated with flame structures recorded by film. Signals from all probes are acquired and processed by PDP-8 and PDP-1103 Digital Equipment Corporation computers. GRA

SPECTROELECTROCHEMICAL MONITORING OF ELECTRODE REACTIONS BY MULTIPLE SPECULAR REFLECTANCE SPECTROSCOPY Technical Report, 15 Jun. 1978 - 1 Jul. 1979
Charles E. Baumgartner, Gary T. Marks, David A. Aikens, and Herbert H. Richtol Oct. 1979 24 p refs Submitted for publication
(Contract N00014-78-C-0494)
(AD-A076951; TR-1) Avail: NTIS HC A02/MF A01 CSCL 09/1

Multiple specular reflection is the basis of a new thin layer spectro-electrochemical cell which does not use optically transparent electrodes, the optical sensitivity of which exceeds that of cells using transparent electrodes by a factor of several hundred. As a result, the ability to detect short-lived intermediates and weakly absorbing species in spectroelectrochemical studies is much improved. Absorbance changes less than 5 x 10 to the minus 5 absorbance units per electrode reflection are readily observed. A cell 4cm long with a 120 micrometers spacing, operated to give approximately 330 reflections, was used to monitor optically the reduction of methylene blue and the reoxidation of the leuco form at concentrations as low as 5 x 10 to the minus 7M. For both reactions, the absorbance is linear with square root of t from 10 ms to ca 3 s, and the magnitude agrees well with values calculated from the geometry of the optical path. Among the advantages of the new technique are greatly increased optical sensitivity and the ability to use electrode materials which are not transparent. GRA

Flame initiation and propagation through an air-fuel vapor-fuel drop system is numerically modeled in a cylindrical one-dimensional combustor. Using an unsteady formulation and allowing unsteady mass, momentum and heat transfer between the two phases, results have been obtained to observe the effects of activation energy, preexponential factor, intitial droplet size, initial temperature, stoichiometric ratio and diffusivity on the flame propagation. It is observed that the process is essentially unsteady. Also, unlike pre-mixed case, heterogeneous combustion gives rise to large variation in fuel-air ratio, which could produce a secondary diffusion flame in the wake of a propagating flame. GRA

ISOMERIZATION AND DECOMPOSITION OF 1.2 EPOXY PROPANE BY INTENSE CO2 LASER RADIATION [ISOMERISIERUNG UND ZERFALL VON 1.2-EPOXIPROPAN BEI BESTRAHLUNG MIT INTENSIVEN CO2 - LASERLICHT]
M. Kneba and H. G. Wagner Nov. 1978 23 p refs In GERMAN
(MPIS-18/1978; ISSN-0436-1199) Avail: NTIS HC A02/MF A01; Fachinformationszentrum, Goettingen, West Germany DM 6,30

The competing reactions of isomerization and photolysis of 1,2-epoxy propane under intense infrared radiation from a CO2 laser were studied quantitatively in order to clarify some mechanisms of hydrocarbon oxidation. The experimental work was done at different pressures using a CO2 laser pulse energy of 0.1 and 1.5 joules. Direct heating by infrared quanta absorption and energy transfer from SF6 molecules were used. Results are presented in charts showing the concentration of the different reaction products such as aldehyde, acetone, and vinylic ether as a function of 1,2-epoxy propane partial pressure, of the laser pulse intensity, and of the dilutant partial pressure. ENVIRONMENTAL EFFECTS ON THE MECHANISM OF FRETTING FATIGUE IN 7075-T6 ALUMINUM Ph.D. Thesis
Cheung Jarm Poon 1979 116 p
Avail: Univ. Microfilms Order No. 8002392

A cyclic type of loading with a sinusoidal waveform at a frequency of 10 Hz was applied to the specimen, which was under a normal contact pressure of 6000 psi with a fretting pad at the same time, until failure occurred. Statistical analysis of the data led to the conclusion, with at least 95 percent confidence, that the chemical corrosion process in fretting fatigue plays the dominant role in reducing fatigue life. Fractographic analysis on failed specimens indicates that different mechanisms of fretting fatigue resulted from different environments. In laboratory air environment, the generation of pits due to fretting is considered to be the cause of crack initiation which led to subsequent early failure of the specimen. In vacuum environment, the fretting damage was less severe, and crack initiation is considered to result from the action of tangential surface stress on welded metallic junctions between two contacting surfaces. Dissert. Abstr.

CHARACTERIZATION OF METAL DAMAGE THROUGH INFRARED TECHNOLOGY Ph.D. Thesis
Sharon Lynn Langenbeck 1979 275 p
Avail: Univ. Microfilms Order No. 8002376

Five different materials, 410 Stainless Steel, Waspaloy (y.s. 120), 17-4 PH Stainless Steel, Ti-6A1-2Sn-4Zr-2Mo, and Waspaloy (y.s. 154), were used to characterize the thermal profile of a fatigue crack. Both the 410 Stainless Steel and Waspaloy (120) were tested under the new and used (wear) conditions. During stable crack growth the change in temperature at the crack tip was quite small and steadily increased as the stress intensity increased. The last few cycles before failure showed a sharp increase in the thermal gradient with no cooling below ambient at the crack tip. From the ambient temperature both an increase and a decrease in temperature was observed during stable crack growth. The cooling at maximum load is response from elastic loading while the heating is due to a plasticity effect. At lower stress levels the decrease in temperature correlated quite well with the theoretical data. However, as the stress increased the experimental data had a larger change in temperature than predicted. Dissert. Abstr.

N80-18149 Ohio State Univ., Columbus.
MECHANISMS OF RECOVERING LOW CYCLE FATIGUE DAMAGE IN INCOLOY 901 Ph.D. Thesis
Robert Edward Schafrik 1979 259 p
Avail: Univ. Microfilms Order No. 8001823

The effect of thermal treatment and hot isostatic pressing (HIP) on eliminating low cycle fatigue (LCF) damage was investigated during tests done in air at 500 F at a total strain range of 0.75%. The mechanisms of crack initiation and crack propagation in baseline specimens were determined and used as the basis of comparison for the rejuvenated specimens. A pre-rejuvenation damage level of 800 cycles (60% of crack initiation) was selected. Some specimens to be HIP processed were ceramic coated; the rest were left uncoated. Post-HIP testing revealed that LCF properties were adversely affected by surface microstructural damage caused by the HIP processing. Thermal rejuvenation, consisting of a standard solution treatment and double aging, was partially successful in recovering fatigue properties. Initiation life was extended by 400 cycles and cycles to failure was extended by 600 cycles. This behavior is explained in terms of microstructural damage. Dissert. Abstr.

N80-18150 Ohio State Univ., Columbus.
ELECTROCHEMICAL INVESTIGATION OF HOT CORROSION Ph.D. Thesis
George William Watt 1979 198 p
Avail: Univ. Microfilms Order No. 8001854

Four different electrodes were investigated in molten sodium sulfate: (1) a Pt foil immersed in the melt; (2) a silver wire in a mixture of 10 m/o Ag_2SO_4 in Na_2SO_4, enclosed in a mullite tube; (3) a Pt-wire immersed in Na_2SO_4 over which an equilibrated mixture of $SO_3/SO_2/O_2$ is passed, the system enclosed in a mullite tube; and (4) a Pt-wire in oxygen inside a calcia-stabilized zirconia tube. These electrodes were then employed to study the corrosion of pure Ni, pure Cr, and the compound NiAl covered with thin molten sodium sulfate films and various gaseous atmospheres over the salt film. Open circuit potential measurements with Ag/Ag_2SO_4, SO_2/O_2 gas, and fully or partially stabilized ZrO_2 reference electrodes were made. Galvanic current measurements with the corroding metal coupled to a Pt electrode as well as potentiostatic polarizations were also accomplished. The results are interpreted in terms of a scale fluxing model and a scale growth and dissolution model analogous to scale growth and evaporation in metal/gas reactions. Dissert. Abstr.

N80-18151 Illinois Univ. at Urbana-Champaign.
ANELASTIC STUDIES OF INTERSTITIALLY TRAPPED HYDROGEN IN NIOBIUM Ph.D. Thesis
Philip Emerson Zapp 1979 140 p
Avail: Univ. Microfilms Order No. 8004311

The local motion of hydrogen trapped by oxygen and nitrogen solutes was studied using anelastic relaxation methods. Internal friction peaks due to the reorientation of O-H pairs were measured in the < 100 >, < 110 > and < 111 > directions of niobium single crystals. Reorientation occurs by hydrogen jumping around the fixed O interstitial trap, the frequency of which was found to be higher in The < 111 > direction than in the < 110 > direction. The activation enthalpy of motion was 0.12 eV in The former direction and 0.18 eV in the latter. Two probable models for the O-H defect are (1) a single O-H pair with < 100 > monoclinic point symmetry, and (2) two types of pairs, one with < 100 > orthorhombic symmetry and the other with < 100 > monoclinic symmetry. The jump frequency of nitrogen-trapped hydrogen in the temperature range of about 40 to 80K was

studied with strain relaxation and low frequency internal friction techniques. The jump frequency at a given temperature was found to be lower than that of oxygen-trapped hydrogen, and it is in good agreement with the Flynn-Stoneham theory of phonon-assisted quantum tunneling. Dissert. Abstr.

N80-18152 Illinois Univ. at Urbana-Champaign.
THE CHARACTERIZATION OF THE THERMODYNAMICS OF SPECIFIC AND NONSPECIFIC INTERACTIONS IN LIQUID METAL MIXTURES Ph.D. Thesis
Kenneth Richard Cox 1979 186 p
Avail: Univ. Microfilms Order No. 8004152

The application of three different solution models to liquid metal mixtures was investigated. A Dolezalek type chemical model was used to represent activity coefficient and phase equilibria behavior for liquid metal systems which are expected to form strong complexes. A general linear least squares technique for calculating chemical theory parameter values was proposed and a physical model which includes the electron contributions to the total energy was applied to liquid metal systems for which no strong complexes were expected to form. A combination chemical physical model was proposed to deal with specific interactions. The model uses a single physical parameter to represent each binary pair. One chemical parameter is used for each complex formed in the liquid metal. The model is applied to represent both activity coefficient and solid liquid phase boundary data. A comparison is made between predicted and experimental results. The experimental activities were obtained using a multiple Knudsen cell-mass spectrometer technique. The results were compared with the predictions of the single parameter physical model. Dissert. Abstr.

STUDY OF THE EFFECTS OF GASEOUS ENVIRONMENTS ON THE HOT CORROSION OF SUPERALLOY MATERIALS Final Report
John G. Smeggil and N. S. Bornstein 5 Feb. 1980 93 p
(Contract NAS3-21376)
(NASA-CR-159747; R79-914387-4) Avail: NTIS HC A05/MF A01 CSCL 11F

The effect of the gaseous corrodent NaCl on the high temperature oxidation and sodium sulfate induced hot corrosion behavior of alumina formers, chromia formers, and the superalloy B-1900 was examined. Isothermal experiments were conducted at 900 C and 1050 C in air in the presence and absence of NaCl vapors. Microstructural changes in oxide morphology and increased rates of oxidation were observed when NaCl(g) was present. It is hypothesized that the accelerated rates of oxidation are the result of removal of aluminum from the scale substrate interface and the weakening of the scale substrate bonds. The aluminum removed was redeposited on the surfaces in the form of alumina whiskers. For the superalloy B-1900, alumina whiskers are also formed, and the alloy oxidizes at catastrophic rates. In the case of Ni-25Cr alloy, NaCl vapors interact with the scale depleting it of chromium. R.C.T.

PRELIMINARY STUDY OF A SOLAR SELECTIVE COATING SYSTEM USING BLACK COBALT OXIDE FOR HIGH TEMPERATURE SOLAR COLLECTORS
G. McDonald 1980 16 p refs Proposed for presentation at Intern. Conf. on Metal Coatings, San Diego, Calif., 21-25 Apr. 1980; Sponsored by Am. Vacuum Soc.
(NASA-TM-81385; E-293) Avail: NTIS HC A02/MF A01 CSCL 10A

Black cobalt oxide coatings (high solar absorptance layer) were deposited on thin layers of silver or gold (low emittance layer) which had been previously deposited on oxidized (diffusion barrier layer) stainless steel substrates. The reflectance properties of these coatings were measured at various thicknesses of cobalt for integrated values of the solar and infrared spectrum. The values of absorptance and emittance were calculated from the measured reflectance values, before and after exposure in air at 650 C for approximately 1000 hours. Absorptance and emittance were interdependent functions of the weight of cobalt oxide. Also, these cobalt oxide/noble metal/oxide diffusion barrier coatings have absorptances greater than 0.90 and emittances of approximately 0.20 even after about 1000 hours at 650 C. Author

EFFECTS OF IMPURITIES IN COAL-DERIVED LIQUIDS ON ACCELERATED HOT CORROSION OF SUPERALLOYS Final Report
Daniel L. Deadmore and Carl E. Lowell Mar. 1980 30 p refs
(Contract EF-77-A-01-2593)
(NASA-TM-81384; DOE/NASA/2593-79/13; E-292) Avail: NTIS HC A03/MF A01 CSCL 11F

A Mach 0.3 burner rig was used to determine the effects of potential coal derived liquid fuel impurity combustion of products on hot corrosion in IN-100, IN-792, IN-738, U-700, Mar M-509, and 304 stainless steel. The impurities, added as aqueous solutions to the combustor, were salts of sodium, potassium, vanadium, molybdenum, tungsten, phosphorus, and lead. Extent of attack was determined by metal consumption and compared to the effects of sodium alone. Vanadium, molybdenum, tungsten, phosphorous, and lead in combination with sodium all resulted in increased attack as compared with sodium alone at some temperatures, apparently due in large part to the extension of the formation of liquid deposits. Varying the sodium-potassium ratio had little effect for ratios less than 1:3 for which reduced, but measurable, attack was observed. K.L.

N80-18158# Rock Island Arsenal, Ill. Engineering Directorate.
AN EVALUATION OF PROCESSES FOR THE BLACKENING OF PRECIPITATION-HARDENED STAINLESS STEELS
J. T. Menke Jun. 1979 32 p
(AD-A075134; SARRI-EN-TR-79-01) Avail: NTIS HC A03/MF A01 CSCL 11/6

Precipitation-hardened stainless steels (corrosion-resistant materials with excellent mechanical properties) require dark, nonreflective finishes to be useful for most military applications. Work involving such finishes was conducted to determine which of the various blackening processes could be used for these materials without decreasing their inherent corrosion resistance. Corrosion tests were conducted on coated and uncoated 17-4, 17-7, 14-8Mo, and AM350 alloys in the annealed and precipitation-hardened condition. The blackening processes evaluated included black chromium plating, zinc phosphating, molten sodium dichromate, and alkaline-oxidizing treatments. Activated and passivated specimens were used as controls in the corrosion tests. Potentiostatic, potentiodynamic, and 5% salt spray (astm-b117) tests were used to evaluate the various specimens. Salt-spray tests showed that maximum corrosion protection was provided by black chromium and zinc phosphate coatings. All corrosion tests showed that black coatings produced by the alkaline-oxidizing process provided varying degrees of corrosion

resistance, dependent upon the alloy or thermal treatment used, and that coatings produced by the molten sodium dichromate treatment provided poor corrosion protection. Black coatings on the 14-8Mo and AM350 alloys exhibited the best corrosion resistance. GRA

FATIGUE CRACK GROWTH OF A508 STEEL IN HIGH-TEMPERATURE, PRESSURIZED REACTOR-GRADE WATER
W. H. Cullen, Jr., V. Provenzano, K. J. Torronen, H. E. Watson, and F. J. Loss 28 Sep. 1979 58 p refs
(AD-A075506; NRL-MR-4063; NRL/NUREG-CR-0969) Avail: NTIS HC A04/MF A01 CSCL 11/6

Fatigue crack growth tests of A508-2 pressure vessel steel have been conducted at two test temperatures (93 C and 288 C) using a variety of constant amplitude waveforms. The load ratios were either 0.1 or 0.125, and the water chemistry was carefully monitored and controlled so as to simulate the nominal pressurized water reactor chemistry. The test procedures are described, and an examination of all the data indicates that the results fall into one of two rather clearly defined categories. One band of data, termed 'low', lies close to or essentially on, the ASME Section XI Code air environment default line. The other band of data, termed 'high', resides approximately midway between the ASME Sec. XI air and water environment default lines. The two bands of data are the result of certain combinations of the waveform and temperature variables listed above, and are determined by the following rules: (1) a ramp time in excess of one second is needed to obtain the high crack growth rate; and (2) the application of a hold time, together with a high temperature, serves to depress a normally high crack growth rate test (i.e., one with a long ramp time) and force it into the low category. A hydrogen embrittlement model is used as a basis for the explanation of this behavior. During the longer ramp times (approximately one second) hydrogen formed by aqueous hydrolysis diffuses into the plastic zone resulting in local embrittlement. GRA

HYDROGEN-EMBRITTLEMENT-HYDRIDE FRACTURE
S. Gahr, B. J. Makenas, and H. K. Birbaum Sep. 1979 20 p refs
(Contract N00014-75-C-1012)
(AD-A076912) Avail: NTIS HC A02/MF A01 CSCL 20/11

Consideration is given to causes for the extreme brittleness observed for most hydrides. Surface energies for cleavage of the beta NbH0.82 f.c. orthorhombic hydride along the (1,00) and (110) are obtained using fracture mechanics methods. The values are shown to be about equal to those of b.c.c. niobium. The relative surface energies of niobium and NbH are consistent with measurements of phonon frequencies and elastic constants. None of the data indicates any decrease of atomic bonding due to the incorporation of hydrogen in the metal lattice. Dislocation mobility is considered on the basis of T.E.M observations and the crystal structure. It is shown that half of the /110/ <111> slip systems cause hydrogen disordering and therefore experience a high lattice frictional stress. Domain boundaries also are shown to be dislocation barriers. Hydride brittleness is considered to result from the decrease in dislocation mobility and in the slip systems available to cause plastic blunting at elastic discontinuities. GRA

ADVANCED ALUMINUM ALLOYS FROM RAPIDLY SOLIDIFIED POWERS Research and Development Status Report, 5 Mar. - 4 Jun. 1979
R. E. Lewis Jun. 1979 23 p refs
(Contract F33615-78-C-5203; DARPA Order 3575)
(AD-A077197; LMSC-D677934) Avail: NTIS HC A02/MF A01 CSCL 11/6

Advanced aluminum alloys are to be developed that will provide major payoffs for important new aircraft, spacecraft, and missile systems in the next decade. Payoffs will result from weight savings of structural components which, in turn, lead to increased range, payload, service life, and decreased life-cycle cost. Recently conducted feasibility and design tradeoff studies provide a basis for selecting certain property goals for improved aluminum alloys that will result in significant weight savings. GRA

DEVELOPMENT OF ADVANCED ALUMINUM ALLOYS FROM RAPIDLY SOLIDIFIED POWDERS FOR AEROSPACE STRUCTURAL APPLICATIONS Interim Technical Report, 5 Mar. - 4 Sep. 1979
R. E. Lewis Sep. 1979 137 p refs
(Contract F33615-78-C-5203; ARPA Order 3575)
(AD-A077800; LMSC-D678772) Avail: NTIS HC A07/MF A01 CSCL 11/6

Advanced aluminum alloys are being developed that will provide major payoffs in terms of weight savings for new aerospace structures. The two property goals are: (1) a 30-percent increase in modulus of elasticity-to-density ratio, and (2) a 20-percent increase in modulus of elasticity-to-density ratio plus a 20-percent increase in strength-to-density ratio, when compared to Al 7075-T76 and without a significant loss in other properties important for structural applications. The program is organized into three phases: (1) a fundamental alloy and process development study; (2) scale-up of two best alloys and evaluation of mill product forms; (3) design evaluation involving selected redesign of aerospace components, analysis of payoffs, and recommendations for manufacturing technology development. Phase 1 activity, to be completed in the first two years, is organized into four Tasks: (1) development of advanced aluminum alloys containing lithium; (2) development of advanced aluminum alloys that do not contain lithium; (3) quantitative microstructural analyses and mechanical property correlations; (4) study of aerospace structural applications for advanced aluminum alloys including development and application of a method for predicting weight savings. Phase 1 activity is described below; Phases 2 and 3 have not been initiated. GRA

COMPTON SCATTERING STUDIES OF METALS AND HYDRIDES WITH 412 KeV GAMMA RADIATION Final Report, Oct. 1977 - Sep. 1979
Malcolm J. Cooper Sep. 1979 35 p refs
(Grant DA-ERO-77-G-099; DA Proj. 1T1-61102-BH-57)
(AD-A078801) Avail: NTIS HC A03/MF A01 CSCL 20/6

A 412 KeV Compton spectrometer has been designed at Warwick, and commissioned at the SRC Rutherford Laboratory. The performance of the system was highly satisfactory, but routine operation of the equipment has been hampered by deterioration in the resolution of the detector, and delays have occurred as a result of faults in the computerised data acquisition system. The Compton profile of vanadium has been measured, and is found to be in disagreement with theory, the anisotropies being smaller than predicted. In related investigations evidence for the failure of the impulse approximation has been found, and the viability of obtaining cohesive energies from Compton profiles has been assessed. GRA

SOME ASPECTS OF FATIGUE CRACK CLOSURE IN TITANIUM ALLOYS Final Scientific Report, 1 Jan. - 30 Jun. 1979
C. J. Beevers 31 Aug. 1979 42 p refs Prepared for AF Office of Sci. Res., Washington, D.C. and European Office of Aerospace Res. and Develop., London
(Grant AF-AFOSR-0045-79; AF Proj. 2301)
(AD-A076948; EOARD-TR-80-2) Avail: NTIS HC A03/MF A01 CSCL 11/6

Fatigue crack growth at intermediate rates and R 0.1 has been measured in compact tension specimens of the alloys Ti-6Al-4V and Ti-6Al-5Zr-0.5Mo-0.25Si. Crack length was determined from the output of a crack mouth displacement gauge and by using a d.c. potential drop technique. The incidence of crack closure was examined during fatigue by using both of the above methods; COD was found to be more reliable for closure measurement than potential drop. In contrast to the fine microstructured Ti-6Al-4V, the coarse Ti-6Al-5Zr-0.5Mo-0.25Si showed substantial load transfer across the crack faces during

fatigue and this was attributed to a 'non-closure' mechanism. Low crack growth rates in the latter alloy were rationalized in terms of an effective delta K. Marked reductions in growth rate produced by variable amplitude loading at Ti-6Al-4V could not be explained by crack closure. GRA

APPLICATION OF SOLIDIFICATION THEORY TO RAPID SOLIDIFICATION PROCESSING Semiannual Report, 1 Apr. - 30 Sep. 1979
W. J. Boettinger, J. W. Cahn, S. R. Coriell, and J. R. Manning Oct. 1979 19 p refs
(ARPA Order 3751)
(AD-A076947) Avail: NTIS HC A02/MF A01 CSCL 13/8

Work is reported on the following areas of rapid solidification processing: (1) Microsegregation and Stability at the Solidification Interface, (2) Glass Formation by Rapid Cooling of Eutectic Systems, (3) Compositional Limits Imposed by Thermodynamics during Rapid Solidification and Relative Stability of Heterogeneous Microstructures. The theory of rapid solidification was investigated to determine whether major aspects of rapid solidification processes can be explained by conventional solidification theory and to examine non-equilibrium effects which can arise. In particular, segregation effects, glass-forming tendencies, and rules governing the formation of equilibrium and non-equilibrium phases, including alloy composition limits, reaction sequences and metastable phase formation, will be investigated. TRANSPORT AND RECOMBINATION PROPERTIES OF LEAD TIN TELLURIDE ALLOYS Final Report, 1 Jan. 1978 - 30 Sep. 1979
Kurt Weiser 1979 13 p
(Grant AF-AFOSR-3509-78; AF Proj. 2306)
(AD-A078687; AFOSR-79-1260TR) Avail: NTIS HC A02/MF A01 CSCL 20/12

Doping effects and photoconductivity were studied for single crystal films of lead tin telluride (Pb(0.8)Sn(0.2)Te) grown by vapor phase epitaxy. Growth of films was carried out by an evaporation condensation process in which the alloy was evaporated from a polycrystalline source and the vapor was condensed on a barium fluoride substrate. Interesting doping effects were obtained with indium which produces a deep level in the gap with unusual properties. Extensive galvanomagnetic measurements suggest that indium enters as a self-compensating impurity and pins the Fermi level near midgap, in contrast to other Group III elements such as gallium and thallium which dope the material n-type and p-type, respectively. An investigation of the kinetics of photoconductivity revealed that around the 'device temperature' of 77 K, the recombination of excess carriers is thermally activated, but becomes approximately temperature independent below 50 K. These results and the magnitude of the photoconductive life-time lead to the surprising conclusion that contrary to prevailing opinion, Auger recombination is not the dominant recombination mechanism for samples with carrier concentration in the 1-10/10 to the 16th power cc range. STUDY OF THE RELATIONSHIP OF MICROPOROSITY IN NICKEL-BASED ALLOYS TO STRUCTURAL HARDENING WITH TITANIUM AND ALUMINUM DURING PRECISION CASTING European Concerted Action - COST 50. Materials for Gas Turbines, Project F5/1 Final Report [ETUDE DE LA SENSIBILITE A LA MICROPOROSITE D'ALLIAGES BASE NICKEL A DURISSEMENT STRUCTURAL PAR LE TITANE ET L'ALUMINIUM POUR FONDERIE DE PRECISION]
Philippe Julien, Jean-Claude Lecomte, Francoise Lavaud, Gerard Lesoult, Francine Wets, and Eric Bachelet 16 Nov. 1978 59 p refs In FRENCH Prepared in cooperation with Ecole des Mines de Paris
(Contracts DGRST-74-7-0152; DGRST-74-7-0153; DGRST-74-7-0154; DGRST-76-7-0608; DGRST-76-7-0609) Avail: NTIS HC A04/MF A01

The correlations between chemical composition, the solidification process, and the tendency towards microporosity were studied in controlled casting and cooling conditions, using eight types of INCONCEL 738 alloy and eight types of C263 alloy. A negative correlation was found between the microporosity index of the C263 alloy and the fraction of eutectic gamma-carbide. The microporosity generation mechanisms are discussed pointing out that the alloys rich in carbon and carbide forming elements, such as Ti, Zr, Hf, show higher porosity independent of the eutectic quantity formed at the end of the solidification period, suggesting an alternative type of porosity forming mechanism. VARIATION IN THE MECHANICAL PROPERTIES AND IN THE FRACTURE STRENGTH OF AN ALUMINUM 7075 T651 PLATE, MEASURED IN THE DIRECTION OF THICKNESS
H. F. deJong Jul. 1978 43 p refs In DUTCH; ENGLISH summary
(VTH-LR-271) Avail: NTIS HC A03/MF A01

The variation in mechanical properties and fracture toughness in the direction of thickness of an aluminum plate (7075 T651 alloy) with a thickness of 25.4 mm was investigated using a constant strain test technique. The results show there is a distinct inhomogeneity in this direction for both the mechanical properties and fracture toughness as well as for hardness. Possible explanations for this behavior related to the microstructure are discussed. Author (ESA)

CRYSTALLINITY, MORPHOLOGY, AND RHEOLOGY OF PVC-PLASTICIZER SYSTEMS Ph.D. Thesis
Pravin Laxminarayan Soni 1979 156 p
Avail: Univ. Microfilms Order No. 8002052

Gels of atactic PVC in certain solvents were found to yield higher than normal levels of crystallinity. The crystallites were found to have a broad range of melting points indicating the

presence of a range of size and/or perfection. Upon orientation, gels from dimethyl phthalate were found to exhibit an anomalous meridional reflection in the wide angle X-ray diffraction fiber pattern. Plasticized PVC was found to consist of a heterogeneous distribution of plasticizer. The 100-200 A microdomains, which are essentially unplasticized, do not fuse at temperatures up to 165 C. However, at 180 C they begin to fuse, resulting in a more homogeneous distribution of the plasticizer. Increasing the size distribution of particles in PVC plastisols was found to decrease the shear thickening effect at the high shear rates. Addition of coarse particles was found to result in a reduction in the low shear viscosity. Dissert. Abstr.

CALORIMETRIC STUDIES OF POLYMER BLEND SYSTEMS Ph.D. Thesis
Charles Luce Ryan, Jr. 1979 222 p
Avail: Univ. Microfilms Order No. 8004983

Several polymer blend systems were studied utilizing Tian-Calvet microcalorimetry and differential scanning calorimetry. The model system was polystyrene/poly(2,6-dimethyl-1,4-phenylene oxide). Different substituents were added to the polystyrene chain and noted for the effect on the compatibility with PPO. Substituents included fluorine, chlorine, bromine and methyl in both the 2 and 4 position on the polystyrene phenyl group. The thermodynamics of mixing was observed utilizing Hess's law to measure the polymer-polymer heat of mixing. Equilibrium states below T sub g were explored using Tian-Calvet microcalorimetry coupled with Hess's law. This method allows the location of both the binodal and spinodal phase boundaries in the glassy state and the establishment of an UCST. The contours of the free energy-composition diagram are discussed.

THE EFFECT OF PARTICLE SHAPE OF MODEL FILLER ON THE REINFORCEMENT OF ELASTOMERIC VULCANIZATES Ph.D. Thesis
Chuk Ling Leung 1980 139 p
Avail: Univ. Microfilms Order No. 8003394

The interaction between SBR vulcanizates and a model polymeric filler, polystyrene, was studied together with the effect of particle shape on the properties of such filled vulcanizates. It was found that for peroxide cured vulcanizates with polymeric filler, the degree of filler-polymer interaction decreased as the cure time was decreased from the optimum. Electron micrographs showed that after hot milling, the spherical polystyrene particles were distorted to ellipsoidal particles and aligned in the direction of milling. Physical properties of these vulcanizates, except the Young's modulus, were found to be anisotropic. Physical properties measured in the direction of filler alignment were found to be better than those measured transverse to filler alignment. The degree of anisotropy was also found to increase as the length of the ellipsoidal particles increased. Young's modulus was found to be independent of filler size, shape or orientation.

STYRENE-BUTADIENE COPOLYMERIZATION IN ORGANOLITHIUM SYSTEMS Ph.D. Thesis
Ling-Kun Huang 1979 179 p
Avail: Univ. Microfilms Order No. 8003393

The organolithium-initiated copolymerization of styrene and butadiene was studied in detail using sec-butyl lithium as polymerization initiator in various solvents and solvent-mixtures. The composition of the copolymers and the chain microstructure were determined by NMR analysis. In bulk or in hydrocarbon solvents, the reactivity ratio of butadiene was much higher than that of styrene, in spite of the much higher reactivity of styrene in homopolymerization. Small additions of polar solvent had a significant effect on the reactivity ratios of styrene and butadiene, and also on the microstructure of polybutadiene. Arrhenius functions were plotted for the relationship between temperature and reactivity ratios. Within experimental error, the reactivity ratios of the styrene-butadiene pair were unaffected by changes in initiator concentration in the range from .001 to .01M. Dissert. Abstr.

THE PHYSICS OF POLY(ETHYLENE OXIDE)/POLY (METHYL METHACRYLATE) BLENDS Ph.D. Thesis
Dennis Mark Hoffman 1979 215 p
Avail: Univ. Microfilms Order No. 8004938

The PEO/PMMA blend is shown to be compatible at all compositions above the melting point of the PEO based on the behavior of the glass transition, the spherulite growth rate, and morphological evidence. The temperature dependence of spherulite growth follows the Fischer-Turnbull expression if a WLF modification of the diffusion term is used. If the glass transition temperature varies according to a Fox type equation, the depression of the spherulite growth rate follows from the hypothesis of compatibility in the melt. Further evidence supporting the contention of melt compatibility is found from the shift in the dynamic mechanical tan delta maxima and DSC transition phenomena. At intermediate compositions, these types of measurements are difficult to interpret because recrystallization and melting phemonena occur near T sub g. Morphological and crystallization behaviors are used to show that these compositions are also compatible. Dissert. Abstr.

SPECIFIC SOLVENT INTERACTIONS AND STRESS INDUCED CRYSTALLINITY IN POLYMERS Ph.D. Thesis
Edward Balizer 1979 253 p
Avail: Univ. Microfilms Order No. 8004486

Stress induced crystallization was investigated in networks of trans polychloroprene and cis polyisoprene crosslinked by dicumyl peroxide. Theories of stress induced crystallization were used to analyze the experimental results. In addition, the equilibrium of intra- and intermolecular hydrogen bonds was investigated for syndiotactic and isotactic polyvinyl alcohol in aqueous solution. The partition function was calculated along with the chain second moment and its temperature coefficient. It was found that both tacticities, isotactic and syndiotactic, have negative temperature coefficients. The isotactic chain populates the transconformer with increasing intramolecular bond strength. However, the syndiotactic chain shifts from the trans to the lefthanded helical conformation with increasing bond strength. These results are in accord with negative temperature coefficients and the majority of experimental results. Author

ACOUSTIC FATIGUE STRENGTH OF FRP PANELS
T. Fujii, T. Fukuda, S. Iida, and M. Sano 1979 5 p refs
Repr. from Organic Coatings and Plastic Chem., vol. 40, 1979 p 682-687 Presented at the Am. Chem. Soc./Chem. Soc. of Japan Chem. Congr., Honolulu, 1-6 Apr. 1979 Sponsored by Am. Chem. Soc. Prepared in cooperation with Natl. Aerospace Lab., Tokyo
Copyright. Avail: NTIS HC A02/MF A01

Acoustic fatigue in four kinds of fiber reinforced panels (FRP) with three layers consisting of roving glass cloth and/or glass-fiber mat reinforced unsaturated polyester resin is examined. It is observed that the glass-fiber mat reinforced test panel may be more isotropic in the failure pattern than the roving glass cloth reinforced test panels. The experimental results indicate that the acoustic fatigue strength of FRP test panels is considerably lower than the fatigue strength of FRP materials tested under constant stress. Under several assumptions, the acoustic fatigue life of test panels is predicted by the experimental data of fatigue strength of FRP obtained from the constant stress testing. Good agreement with the experimental data is shown. Furthermore, the increase of acoustic fatigue strength of such test panels is experimentally investigated by bonding carbon FRP on the middle part of a panel or laminating carbon fiber woven tapes simultaneously in the molding process of panels. As a result, it is found that the latter stiffening method is more effective. M.G.

WEAR PARTICLES OF SINGLE-CRYSTAL SILICON CARBIDE IN VACUUM
Kazuhisa Miyoshi and Donald H. Buckley Feb. 1980 24 p refs Submitted for publication
(NASA-TP-1624; E-077) Avail: NTIS HC A02/MF A01 CSCL 20B

Sliding friction experiments, conducted in vacuum with silicon carbide /000/ surface in contact with iron based binary alloys are described. Multiangular and spherical wear particles of silicon carbide are observed as a result of multipass sliding. The multiangular particles are produced by primary and secondary cracking of cleavage planes /000/, /10(-1)0/, and /11(-2)0/ under the Hertzian stress field or local inelastic deformation zone. The spherical particles may be produced by two mechanisms: (1) a penny shaped fracture along the circular stress trajectories under the local inelastic deformation zone, and (2) attrition of wear particles. TACKIFIER FOR ADDITION POLYIMIDES Patent Application
Terry L. StClair and John M. Butler, inventors (to NASA) (Virginia Polytechnic Inst. and State Univ., Blacksburg) Filed 7 Nov. 1979 18 p
(NASA-Case-LAR-12642-1; US-Patent-Appl-SN-092141) Avail: NTIS HC A02/MF A01 CSCL 11G

An improvement of addition polyimides wherein an essentially solventless, high viscosity laminating resin is synthesized from low-cost liquid monomers is presented. The improved process takes advantage of a reactive, liquid plasticizer such as monoethylphthalate which is used in lieu of an alcohol solvent, and helps solve a major problem of maintaining good prepreg tack and drape, or the ability of the prepreg to adhere to adjacent plies and conform to a desired shape during the layup process. This improvement results in both longer life of the polymer prepreg and the processing of low-void laminates and appears to be applicable to all addition polyimide systems. NASA

ENVIRONMENTAL STRESS CRACKING OF POLYMERS Final Report
Kent I. Mahan 1980 99 p refs
(Grant NsG-806)
(NASA-CR-162825) Avail: NTIS HC A05/MF A01 CSCL 07/4

A two point bending method for use in studying the environmental stress cracking and crazing phenomena is described and demonstrated for a variety of polymer/solvent systems. Critical strain values obtained from these curves are reported for various polymer/solvent systems including a considerable number of systems for which critical strain values have not been previously reported. Polymers studied using this technique include polycarbonate (PC), ABS, high impact styrene (HIS), polyphenylene oxide (PPO), and polymethyl methacrylate (PMMA). Critical strain values obtained using this method compared favorably with available existing data. The major advantage of the technique is the ability to obtain time vs. strain curves over a short period of time. The data obtained suggests that over a short period of time the transition in most of the polymer solvent systems is more gradual than previously believed. Author

COMPARISON OF THE WEIGHT LOSS AND ADHERENCE OF NINE DIFFERENT POLYIMIDE FILMS THERMALLY AGED AT 315 C AND 350 C IN AIR
Robert L. Fusaro Mar. 1980 34 p refs
(NASA-TM-81381; E-286) Avail: NTIS HC A03/MF A01 CSCL 07D

Thermal exposure experiments at 315 and 350 C were performed in air on nine different types of polyimides applied to thin 304 stainless steel foils. The tests were conducted to determine which polyimide was the most thermally stable and adherent when subjected to long exposure times at elevated temperatures. One polyimide designated PIC-7 was found to be more thermally stable than the others; however, it did not possess the adherent properties of PIC-2 and PIC-5. It was concluded that as far as thermal stability and adherence are concerned, five of the polyimides are more suitable for high temperature applications than the other four. K.L.

FLUOROALKYL SILOXANES AS LIQUID-REPELLENT FABRIC FINISHES. PART 1: A STATE-OF-THE-ART REVIEW AND SYNTHESIS OF THE MONOMERS
John W. Bovenkamp Jun. 1979 36 p refs
(AD-A073149; DREO-R-803-Pt-1) Avail: NTIS HC A03/MF A01 CSCL 11/3

This project concerns the evaluation of fluoroalkyl-substituted siloxane polymers as liquid-repellent finishes. First, a brief literature review is given on the current state-of-the-art of these finishes. Second, syntheses and properties for a family of ten fluoroalkyl silanes are reported. These monomers include the best of those utilized in the literature as well as several new ones chosen to elucidate the effect of structure on liquid repellent properties. A second report will describe the method of polymerization, the liquid repellency values obtained with the homopolymers, and the results of copolymerizations with the much cheaper non-fluorinated silanes. GRA

FLUOROALKYL SILOXANES AS LIQUID-REPELLENT FABRIC FINISHES. PART 2: THE HOMOPOLYMERS AND THEIR COPOLYMERS WITH ALKYL SILANES
J. W. Bovenkamp Jun. 1979 37 p refs
(AD-A073150; DREO-R-804-Pt-2) Avail: NTIS HC A03/MF A01 CSCL 11/3

In this report the liquid-repellant properties of the homopolymers and selected copolymers of ten fluoroalkyl substituted silane monomers of varying structures are evaluated. The homopolymers of the silanes are synthesized, applied to nylon/cotton (50:50 weight percent) and cotton as finishes, and the oil and water repellency imparted to these fabrics ascertained by standard tests. In this manner it is possible to compare the effects of (1) length and degree of branching of the fluorinated alkyl chains, (2) the use of network (three replaceable silane substituents in the monomer) versus linear (two replaceable substituents) siloxane polymers, and (3) the use of either an amide or an ether function to bond the fluoroalkyl group to the polymer backbone. Due to the expense of these fluorinated materials, a study was conducted of the copolymerization of the best fluoroalkyl substituted silanes

with much cheaper non-fluorinated alkyl silanes. Among the latter were those with varying alkyl chain lengths and number and orientation of the replaceable silane substituents. The oil and water repellencies obtained with both the homopolymers and copolymers ranged from outstanding to essentially none. Explanations are advanced for the values obtained and literature comparisons are made. GRA

SYNTHESIS CHARACTERIZATION AND MORPHOLOGY OF A CIS 1, 4 POLYISOPRENE/POLY N-BUTYLMETHACRYLATE DIBLOCK COPOLYMER
Robert E. Cohen and Frank S. Bates Dec. 1979 27 p refs
(Contract N00014-77-C-0311; NR Proj. 356-646)
(AD-A078731; TR-4) Avail: NTIS HC A03/MF A01 CSCL 07/3

Homogeneous anionic polymerization methods were employed to synthesize a diblock copolymer of the form (A)(n)-b-(B)(m) in which repeat unit A is isoprene, B is n-butylmethacrylate and b is a single unit of 1,1 diphenylethylene. Various physical-chemical characterization methods were employed to determine that the molecular weights of the A and B blocks are 80,000 and 160,000 g/mole respectively. NMR spectra indicated that the poly n-butylmethacrylate moiety is composed predominantly of syndiotactic triads. Thermal analysis and dynamic mechanical testing were used to determine the polyisoprene and poly n-butylmethacrylate glass transition temperatures, which were around -70 and 20 C respectively; the poly n-butylmethacrylate transition observed in the viscoelastic experiments was unusually broad, covering more than 75 C from onset to completion. Thin films of the diblock copolymer prepared by solvent evaporation casting methods, using a variety of solvents and a wide range of solvent evaporation rates, showed a variety of morphologies in transmission electron micrographs. Most notable among these was a structure obtained in rapid-evaporation castings which contained relatively large regions of homogeneous diblock copolymer embedded in the microphase-separated material. While these homogenized regions remain unchanged indefinitely in the bulk material at room temperature, they tend to decompose to the stable microphase-separated material upon heating or upon addition of solvent. LONG-TERM THERMAL STABILITY OF SOLITHANE, A CANDIDATE TWT ENCAPSULANT Final Report, 1 Feb. - 30 Sep. 1978
Camille A. Gaulin, Vester L. Knight, and Manfred Buechler Sep. 1979 17 p ref
(Contract F04701-78-C-0079)
(AD-A078832; TR-0079(4402)-1; SAMSO-79-038) Avail: NTIS HC A02/MF A01 CSCL 09/1

In support of traveling-wave tube amplifier tube encapsulant evaluations, a cured sample of Solithane 113 (a polyurethane potting compound supplied by Watkins-Johnson) was exposed to a vacuum-thermal (120 C) environment for 300 hours to determine if channel degradation occurs on such exposure. Degradation was determined qualitatively by sampling into a quadrupole mass spectrometer the gases and vapors produced from the sample and analyzing the spectra of the gases. The resultant spectra indicated significant thermochemical degradation of the polymer under the conditions of the exposure. These results should be factored into deliberations on the choice of encapsulants for TWTA components. Degradation of this kind may markedly affect physical-chemical properties of the material over the long term and should be treated as a potential source of tube failure due to corona discharge. GRA

THE NATURE OF STRENGTH CONTROLLING MACHINING FLAWS IN CERAMICS Interim Report
R. W. Rice and J. J. Mecholsky, Jr. 25 Sep. 1979 33 p refs
(AD-A075491; NRL-MR-4077) Avail: NTIS HC A03/MF A01 CSCL 12/2

The nature of machining flaws introduced in a variety of glass, single crystal, and especially poly-crystal bodies are reported, based on fractographic determination of such flaws as the source of mechanical failure. Particular attention is given to grinding where the anisotropy of strength due to the direction of grinding relative to the tensile axis is shown to be due primarily to a dual population of flaws of differing shapes. One set of flaws form approximately perpendicular and another parallel to the grinding direction. The latter flaws are typically substantially more elongated and often larger than the former and thus give lower strengths for stressing perpendicular to the direction of grinding. Sawing, sanding, and polishing are also shown to result in similar dual flaw populations. The character of flaws are examined as a function of the type of material and machining, as well as specimen size and shape. The latter suggests a limited strength-size effect due to machining flaws. However, the key findings are that machining flaws do not vary greatly with typical variations of machining or material parameters, e.g., composition, grain size, or hardness. GRA

CARBON IMPURITY EFFECT ON THE THERMAL DEGRADATION OF A Si3N4-Y2O3 CERAMIC Final Report
H. Knoch and George E. Gazza May 1979 14 p refs
(DA Proj. 1L1-62105-AH-84)
(AD-A075138; AMMRC-TR-79-27) Avail: NTIS HC A02/MF A01 CSCL 11/2

The oxidation behavior of hot-pressed Si3N4-Y2O3 compounds (principally Si3 Y2O3N4, N-melilite) was studied in air between 700 C and 1440 C. It is shown that carbon impurity strongly influences the thermal degradation of these compounds. Oxidation of carbon-containing materials in air at 1000 C leads to high weight gains, severe cracking, and complete destruction of the samples. Nominally carbon-free materials show good oxidation resistance without cracking. GRA

ULTRASONIC DETECTION OF SURFACE FLAWS IN GAS TURBINE CERAMICS Final Report, 13 Sep. 1977 - 12 Dec. 1978
Thomas Derkacs and Istvan M. Matay Aug. 1979 137 p refs
(Contract N62269-77-C-0136)
(AD-A076023; TRW-ER-7980-F; NADC-76369-30) Avail: NTIS HC A07/MF A01 CSCL 11/2

A 45 MHz ultrasonic surface wave technique was developed and evaluated for detection of small surface flaws of - 100 microns (0.004 inches) in gas turbine quality ceramics. The surface wave technique, which employs conventional immersion C-scan recording, was evaluated on hot pressed silicon nitride and silicon carbide of two sources each, and also on reaction bonded silicon nitride and sintered silicon carbide. These evaluations included tests on specimens run in a burner rig to simulate the effects on NDE of a gas turbine operating environment. Conventional mechanical tests were also run to verify defect sizes and types and to correlate flexural strength with ultrasonic inspection results. The technique was found to be quite sensitive to surface conditions such as grinding damage, as well as to defects. Flexural strength was correlated qualitatively with the extent of ultrasonic response from machining damage. The sensitivity to defects was found to be limited by the depth of machining damage and the focal spot size of the ultrasonic beam. For the 580 microns (0.023 inch) diameter focal spot size used, the smallest defect verified metallurgically was equivalent to a 30 microns (0.0012 inch) deep semi-circular crack. Specimens

run in the burner rig were found to become uninspectable because of fused silica on the surface. Author (GRA)

HIGH SOLIDS COATING SYSTEMS Final Report, 15 Aug. 1977 - 15 Jan. 1979
Gretchen McKay Apr. 1979 95 p
(Contract F33615-77-C-5101; AF Proj. 2422)
(AD-A07' 433; DFR-79-2; AFML-TR-79-4041) Avail: NTIS HC A05/MF A01 CSCL 11/3

The goal of this program is the development of a 65% volume solids, sprayable (airless electrostatic method), polyurethane exterior aircraft coating meeting MIL-C-83286 performance specifications. A high solids coating can significantly reduce solvent emissions and help the Air Force meet EPA/OSHA requirements for reduced environmental pollution and increased work safety. One formulation consisting of a combination of Acryloid AU-568 (oxazolidine), NIAX PCP-0300 (polyol), and Desmodur N-100 (polyisocyanate) exhibited performance properties close to MIL-C-83286. Additional effort is required to simultaneously maximize coating flexibility and solvent (aircraft fluid) resistance. The pot life of the mixed two-package system and the final spray viscosity also must be improved. Potential polyol and polyisocyanate candidates can be successfully screened using concentration-viscosity diagrams. The effects of solvent on solution rheology were greater than expected. GRA

SPACE RADIATION EFFECTS ON TEFLON FILMS Interim Report
Henry S. Judeikis Sep. 1979 40 p refs
(Contract F04701-78-C-0079)
(AD-A076613; TR-0079(4872-01)-02; SAMSO-TR-79-070) Avail: NTIS HC A03/MF A01 CSCL 06/18

Degradation of macroscopic physical properties resulting from chemical changes in fluorocarbon polymers exposed to ionizing radiation is reviewed. The effects of temperature, ultraviolet/visible radiation, and dose rate are considered. Of particular interest are property changes that occur on exposure of these materials to simulated space radiation environments. Results from recent space simulation exposure tests are considered in light of these phenomena. General recommendations are made for the application of existing data to spacecraft problems, as well as for the conduct of future space simulation exposure tests. GRA

EFFECT OF SURFACE EXPOSURE TIME (SET) ON STRENGTH OF ADHESIVE BONDS TO ALUMINUM
Marie C. Ross, Natalia Petrianyk, Elizabeth A. Garnis, Raymond F. Wegman, and David W. Levi Aug. 1979 15 p refs
(AD-A077107; AD-E400356; ARLCD-TR-79009) Avail: NTIS HC A02/MF A01 CSCL 13/8

Surface exposure times (SET) at 23 C and 50% RH for 2024-T3 aluminum subsequently bonded with EC-2214 adhesive did not affect the bond strength for SET up to 30 days. SET at 54 C and 95 + or - 5% RH gave much lower bond strengths that did not further change with increasing SET. The difference in strength is believed to be due to the formation of a hydrated aluminum oxide on the aluminum surface at 54 C and 95 + or - 5% RH. This hydrated oxide functions as a weak boundary layer. GRA

ENVIRONMENTAL DURABILITY TESTING OF STRUCTURAL ADHESIVES. PART 3: RELIABOND 500/RELIABOND 398 Interim Technical Report, Jun. - Dec. 1978
D. Robert Askins Wright-Patterson AFB, Ohio AFML Nov. 1979 31 p ref
(Contract F33615-78-C-5002; AF Proj. 7381)
(AD-A078953; UDR-TR-79-24; AFML-TR-78-35-Pt-3) Avail: NTIS HC A03/MF A01 CSCL 11/1

A program has been conducted to investigate the durability of a 350 F (121 C) curing modified epoxy structural adhesive in an elevated temperature, high humidity environment while under stress. Durability was assessed with three different types of environmental exposure. Unstressed lap shear specimens were exposed to both a 140 F (60 C)/95-100% R.H. environment and a 140 F (60 C) water soak and residual strength tests were conducted after various aging intervals. Stressed lap shear specimens were exposed to a 140 F (60 C)/95-100% R.H. environment and time-to-failure recorded. The unstressed agings produced a progressive loss of residual strength and a progressive increase in the amount of adhesive (interfacial) failure with increased aging time. The stressed agings produced times-to-failure at least as long as those previously obtained (AFML-TR-78-35, Part I) for the PL-729-3/PL-728 and AF-143-2/EC-3917 adhesive/primer systems on the same substrates and surface preparations. Had exposure times been extended beyond 2400 hours, the R398/R500 system may have proven more durable than the two previously tested systems. GRA

ELASTIC/PLASTIC INDENTATION DAMAGE IN CERAMICS. PART 1: THE MEDIAN/RADIAL CRACK SYSTEM. PART 2: A STUDY OF KINK BAND FORMATION IN COMPOSITES Progress Report, 1 Jan. - 1 Dec. 1979
B. R. Lawn, A. G. Evans, D. B. Marshall, and C. H. Hsueh 1 Dec. 1979 63 p refs
(Contract N00014-79-C-0159)
(AD-A078839) Avail: NTIS HC A04/MF A01 CSCL 11/2

A theory for describing the evolution of the median/radial crack system in the far field of sharp-indenter contacts is developed. Analysis is based on a model in which the complex elastic/plastic field beneath the indenter is resolved into elastic and residual components. The elastic component, being reversible, assumes a secondary role in the fracture process: although it does enhance downward (median) extension during the loading half-cycle, it suppresses surface (radial) extension to the extent that significant growth continues during unloading. The residual component accordingly provides the primary driving force for the crack configuration in the final stages of evolution, where the crack tends to near-half-penny geometry. On the hypothesis that the origin of the irreversible field lies in the accommodation of an expanding plastic hardness impression by the surrounding elastic matrix, the ensuing fracture mechanics relations for equilibrium crack growth are found to involve the ratio hardness-to-modulus as well as toughness. Observations of crack evolution in soda-lime glass provide a suitable calibration of indentation coefficients in these relations. GRA

APPLICATIONS OF SURFACE ANALYSIS TECHNIQUES TO STUDIES OF ADHESION Final Report, Mar. - Jul. 1979
William L. Baun Sep. 1979 38 p refs
(AF Proj. 2419)
(AD-A077520; AFML-TR-79-4126) Avail: NTIS HC A03/MF A01 CSCL 11/1

The question is often asked, 'which is the best surface chemistry tool for research on adhesive bonding?' This question is difficult to answer because it depends on the aspects of adhesion which is being studied. Often a combination of instruments must be used to take advantage of the strong points of each. In metal-to-metal bonding there are many facets of adhesive/

adherend interaction. Elemental characterization of adherends, especially when composition with depth is desired, is often best accomplished with Auger Electron Spectroscopy (AES). When information of chemical bonding is required, X-Ray Photoelectron Spectroscopy (XPS) is the choice of most workers. Extremely thin layers of material (when first layer surface sensitivity is needed) requires Ion Scattering Spectrometry (ISS). The high sensitivity of Secondary Ion Mass Spectrometry (SIMS) to many elements important in adhesive bonding makes this technique useful, especially coupled with other methods, such as ISS and AES. Modern surface analysis along with Scanning Electron Microscopy (SEM) provides information on failure surfaces to allow unequivocal determination of the mode of failure. Problems such as charging and decomposition under the probing beam are encountered when characterizing the part of the failure surfaces containing the adhesive. GRA

ENVIRONMENTAL DURABILITY OF THE WELDBOND, FPL AND PABST JOINING SYSTEMS Final Report, 1 Dec. 1977 - 31 May 1979
R. G. Hocker Wright-Patterson AFB, Ohio AFML Jul. 1979 79 p refs
(Contract F33615-76-C-5412)
(AD-A076608; NOR-79-41; AFML-TR-79-4081) Avail: NTIS HC A05/MF A01 CSCL 13/8

This program was conducted as an addendum to Contract No. F33615-76-C-5412, 'Advanced Weldbonding Process Establishment for Aluminum'. Under controlled stress and environmental conditions, a direct comparison of durability and surface corrosion behavior was made for three surface preparation/adhesive systems. These systems included the PABST adhesive bonding system, the FPL adhesive bonding system, and the Northrop weldbond system. The three types of tests used were the wedge test, the constant load-salt water immersion test, and the surface scratch test. Four different environmental exposures were used: (1) 95 to 100 percent relative humidity at 120 F, (2) 5 percent salt fog at 95 F, (3) 3.5 percent salt water and (4) the sea coast beach site at El Segundo, California. Four material combinations were evaluated for this program: 2024-T3 alclad bonded to 7075-T6 bare, 2024-T3 bare bonded to 7075-T6 bare, 2024-T3 bare bonded to 2024-T3 bare, and 7075-T6 bare bonded to 7075-T6 bare. The objective of this program was to rank the three bonding systems and four material combinations in terms of durability and corrosion behavior. GRA

STUDY AND TORSION TESTING OF COMPOSITE MATERIALS IN THE FORM OF BARS HAVING RECTANGULAR CROSS-SECTIONS [ETUDE DU TEST DE TORSION DE BARREAUX COMPOSITES A SECTION RECTANGULAIRE]
Chetha Phang and Tat Sinh Vong Dec. 1977 34 p refs In FRENCH
(Contract DGRST-74-7-0747)
(RR-094) Avail: NTIS HC A03/MF A01

The modulus of shear and the elastic limit at shear were evaluated for an orthotropic prismatic bar of composite structure using extensometric measurements of deformation of shear. A tensor analysis of average deformation at shear is presented as a theoretical introduction to the determination of the shear characteristics of a material through strain gage measurement of surface deformation during torsional stress. The experimental setup is described and the processes used in the fabrication of specimens are outlined. Results show good agreement between predicted linear elastic behavior of the bars and measured deformations at failure. Author (ESA)

EVALUATION OF JP-5 TURBINE FUEL IN THE SINGLE CYLINDER CUE 1790 DIESEL ENGINE Final Report, Jun. - Nov. 1979
Richard B. Moon Nov. 1979 42 p refs
(Contract DAAK70-79-C-0060)
(AD-A078666; AFLRL-119) Avail: NTIS HC A03/MF A01 CSCL 21/4

The performance test compared fuel consumption and

horsepower of the CUE 1970 when operating on JP-5 turbine fuel in place of diesel fuel while the endurance test compared engine wear and deposits when operating the CUE 1790 on JP-5 instead of diesel fuel. The performance test indicated no change in power and a 3 + or - 1 percent increase in fuel consumption. The endurance test indicated no change to slightly less wear, less deposits, no change in the oil consumption rate, and nothing unusual or excessive in the used oil analyses. Analysis of the JP-5 indicated a cetane number within diesel fuel specifications. Although further tests are necessary to define the effect of random variables on the test results, from this test it can be concluded that the use of JP-5 in the CUE 1790 resulted in no appreciable loss in performance or service life. As a result, JP-5 is considered to be a satisfactory alternative fuel for use in the AVDS 1790-2C diesel engine. GRA

PROPELLANT SURVEILLANCE REPORT LGM-30, A, B, F, G, STAGE 1, TP-H1043 AFT CLOSURE PROPELLANT Semiannual Report

John A. Thompson Nov. 1979 33 p

(AD-A078778; MANCP-424(79)) Avail: NTIS HC A03/MF A01 CSCL 21/9

This report contains propellant test results from cartons of TP-H1043 propellant representing selected batches used in the aft closure of First Stage Minuteman Motors. Data from TP-H1043 propellant obtained from the aft closures of the LGM-30 A, B, F and G Motors are reported in regression analyses for the fifth time and the fourth time using the G085 computer system. Testing was accomplished in accordance with MMWRM Project M82934C. An analysis of all parameters indicate that no significant degradation is anticipated for at least two years past the oldest data point. Each point on the regression plot represents all samples at that particular age. The number of samples at each point is indicated on the sample size summary sheet on the page accompanying each regression plot. The data range at any age can be found by suitable inquiry of the G085 system. GRA

PROPELLANT SURVEILLANCE REPORT LGM-30 F & G STAGE 1, PHASE E, SERIES 8, TP-H1011 Semiannual Report

John A. Thompson Oct. 1979 140 p

(AD-A078777; MANCP-423(79)) Avail: NTIS HC A07/MF A01 CSCL 21/9

This report contains propellent test results from cartons of TP-H1011 bulk propellant representing LGM-30 F and G First Stage Minuteman Motors. This report uses a statistical approach to analyze the bulk carton propellant data. Testing was accomplished in accordance with MMWRM Project M82934C - WNL 17514. The data from this test period are combined with data from previous testing and entered into the G085 computer for storage, analysis and regression analysis. From the statistical analysis of all data tested to date thirteen and one-half years for F and G, significant degradation of the propellant does not appear likely for at least two years past the oldest data point. Each point on the regression plot represents the mean of all samples at that particular age. The number of samples at each point is indicated on the sample size summary sheet on the page accompanying each regression plot or group of regression plots. The data range at any age can be found by suitable inquiry of the G085 system. GRA

THE FIRE ENVIRONMENT OF A SOLID ROCKET PROPELLANT BURNING IN AIR Final Report

E. W. Price, W. L. Meyer, W. C. Strahle, S. S. Samant, E. A. Powell, and J. C. Handley Mar. 1979 249 p refs

(Contract F29601-76-C-0119)

(AD-A076941; AD-E200321; AFWL-TR-78-34) Avail: NTIS HC A11/MF A01 CSCL 21/9

A study was made of the fire environment of UTP 3001 propellant burning at atmospheric pressure in air, with particular emphasis on the conditions likely to affect objects immersed in the fire. The studies involved measurements of conditions using propellant samples with planar burning surfaces from 2 to 120 sq cm. Early tests indicated that deposition of condensed materials was a critical factor in heat-up of immersed objects. Several methods of observation were used to determine temperatures, flow variables, nature of condensed material and spatial distributions of these variables. Analyses were made of chemical equilibrium conditions, burning of aluminum droplets, and of size distribution of condensed materials versus location in the flow. GRA

AN INVESTIGATION OF PARTICLE SIZE DISTRIBUTION USING LASER HOLOGRAPHY OF BURNING SOLID PROPELLANT Final Report, Nov. 1977 - 30 Sep. 1978

Michael J. Adams and T. W. Owens Sep. 1979 43 p refs

(AF proj. 2308)

(AD-A078904; AFRPL-TR-79-48) Avail: NTIS HC A03/MF A01 CSCL 21/2

A test area was modified to allow holographic recordings to be made of burning solid propellant samples as contained in a pressurized window bomb. A holographic reconstruction area was also established. An attempt was made to develop a semi-automated holographic data retrieval (HDR) system using existing AFRPL hardware. The purpose of the HDR system was to retrieve particle size and positions information in a timely manner from holographic reconstructions of the propellant combustion. Experiments with the HDR system revealed serious deficiencies in the areas of resolution and particle recognition. Since a primary goal of the program was to establish particle distribution correlations from holographically derived particle information, the present program has been inactivated pending the development and acquisition of an improved HDR system. HYDROGEN AS A FUEL

L. W. Richards Jul. 1979 35 p refs

(TT-7903; ISSN-0140-9751) Avail: NTIS HC A03/MF A01

Research on the storage of hydrogen in automobiles is reviewed. Metal hydride storage, encapsulation of hydrogen in molecular sieve zeolites, and the reaction of saline hydrides with water are considered in detail. After a brief comparison of hydrogen energy yield with gasoline energy yield per weight, hydrogen fuel storage in motor vehicles is considered. Safety factors of different storage schemes (high pressure gas, cryogenic tanks, metal hydrides) are emphasized along with volume and weight considerations. Results show two basic systems as feasible, namely that of a saline hydride reacting with water inside the vehicle, or a system involving a combination of calcium - mischmetal and magnesium, with nickel to act as a catalyst. ACOUSTICS OR SHAKERS FOR SIMULATION OF CAPTIVE FLIGHT VIBRATION **c39**
A. M. Spandrio and M. E. Burke *In* Shock and Vibration Inform. Center The Shock and Vibration Bull., Pt. 4 Sep. 1978 p 5-14 (For primary document see N80-18213 09-31)
Avail: NRL, Tech. Inform. Div., Washington, D.C.

Two methods currently being used to simulate the captive flight vibration loads the PHOENIX missile experiences on the F-14 aircraft are compared. In these programs the PHOENIX T-201 Environmental Measurements Missile was used. This same missile was subjected to captive flight simulation using the dual shaker vibration and acoustical vibration. PHOENIX T-201 was assembled in the same instrumentation configuration during both simulations as it was in the captive flight programs. The excitation of the missile by acoustics more nearly resembled that seen in captive flight than the excitation provided by the dual shakers. Since the acoustic excitation allows the missile to vibrate in three axes simultaneously, the simulation technique becomes far superior when the single axis constraint of shakers is considered. In addition, several test specimens may be placed in the acoustic chamber simultaneously. It was concluded that the use of acoustics for simulation of captive flight vibration demonstrated itself to be an accurate and cost effective test method. M.M.M.

STABILITY AND FREQUENCY RESPONSE OF HYDRO-MECHANICAL SHAKERS IN VIBRATION RIGS **c35**
T. Seshadri Sankar *In* Shock and Vibration Inform. Center The Shock and Vibration Bull., Pt. 4 Sep. 1978 p 33-47 refs Sponsored by the Natl. Res. Council of Canada and the Formation de Chercheurs et d'Action Contertee (For primary document see N80-18213 09-31)
Avail: NRL, Tech. Inform. Div., Washington, D.C.

An analytical study on the stability and frequency response of hydromechanical shakers used for generating vibrational signals to drive a vibration rig is presented. The analytical expressions for stability are derived based on linearized flow characteristic equations and taking into account the effect of fluid inertance and resistance in the connecting pipes. It was shown that the size of the connecting pipes and their elasticity influence the stability of the shaker. Simple expressions are derived for the amplitude ratio and phase angle against frequency for both open and closed loop frequency response of the hydromechanical shaker based on Duffing's linearization scheme. The analytical expressions derived for stability and frequency response can be directly used for selecting and/or specifying the hydromechanical shaker which best meets a given set of requirements. M.M.M.

HIGH FREQUENCY GROUND VIBRATION MEASUREMENT **c39**
H. Nolle *In* Shock and Vibration Inform. Center The Shock and Vibration Bull., Pt. 4 Sep. 1978 p 95-103 refs (For primary document see N80-18213 09-31)
Avail: NRL Tech. Inform. Div., Washington, D.C.

The basic requirements for vibration transducer-to-ground coupling to ensure linear measuring system response are reviewed. Results are presented from field tests of different designs for ground attachments, and recommendations are made for procedures of ground attachment installation in different soil types and rock formations. The techniques are demonstrated with reference to some of the results of vibration surveys of three different railway track installations. K.L.

THE RECIPROCITY CALIBRATION OF VIBRATION STANDARDS OVER AN EXTENDED FREQUENCY RANGE **c39**
R. R. Bouche *In* Shock and Vibration Inform. Center The Shock and Vibration Bull., Pt. 4 Sep. 1978 p 105-111 refs (For primary document see N80-18213 09-31)
Avail: NRL Tech. Inform. Div., Washington, D.C.

Reciprocity calibrations are performed at various frequencies up to 10,000 Hz using an air-breathing shaker with a built-in primary standard accelerometer. The shaker is used for sensitivity and frequency response calibrations on other accelerometers and velocity pickups in the range of 10 Hz to 10,000 Hz and up to 50,000 Hz for resonance frequency calibrations. A NON-CONTRACTING BETA BACKSCATTER GAGE FOR EXPLOSIVE QUANTITY MEASUREMENT **c35**
P. B. Higgins, F. H. Mathews, and R. A. Benham *In* Shock and Vibration Inform. Center The Shock and Vibration Bull., Pt. 4 Sep. 1978 p 113-126 refs (For primary document see N80-18213 09-31)
Avail: NRL Tech. Inform. Div., Washington, D.C.

A noncontracting method of measuring the quantity of light initiable explosive previously applied to a surface is described. Design parameters, calibration procedures, and field results are given for a beta backscatter gage which measures the areal density of a layer of the primary explosive, silver acetylide-silver nitrate (SASN), on a carbon or aluminum subsurface. The radiation patterns produced by the gage using three different beta source geometries are determined and their relative merits are discussed. K.L.

DATA ACQUISITION FOR THE IMMEDIATE FUTURE **c35**
Josef F. Schneider *In* Shock and Vibration Inform. Center The Shock and Vibration Bull., Pt. 4 Sep. 1978 p 127-137 refs (For primary document see N80-18213 09-31)
Avail: NRL Tech. Inform. Div., Washington, D.C.

The problem of acquiring transient data in an extremely hostile environment is addressed. An analog multiplex system that transmits data in real time and requires analog type recording is considered along with a system that multiplexes on the digital side. The data is stored digitally and plotted for quick-look analysis without the need for precomputer data reduction. Application guides and formulae are given for each system, and a comparison is presented which lists respective system merit parameters for similar data handling requirements. K.L.

THE VIBRATION RESPONSE OF THE PHOENIX MISSILE IN THE F-14 AIRCRAFT CAPTIVE-FLIGHT ENVIRONMENT **c15**
Marsha E. Burke *In* Shock and Vibration Inform. Center The Shock and Vibration Bull., Pt. 4 Sep. 1978 p 139-150 refs (For primary document see N80-18213 09-31)
Avail: NRL Tech. Inform. Div., Washington, D.C.

The vibration response characteristics of the PHOENIX missile on the F-14 aircraft in the captive high environment is investigated. Variations in vibration response with flight condition, mounting configuration, direction, and location along the length of the missile are examined. The conclusions are: (1) vibration response in externally carried stores is directly proportional to dynamic pressure except in the transonic region where an increase in vibration occurs; (2) vibration response varies with platform configuration with an increase occurring with additional externally carried stores in the flow fields; and (3) vibration response is most severe in the after section and in the vertical and lateral direction of the externally carried stores. K.L.

TURBULENT-BOUNDARY-LAYER EXCITATION AND RESPONSE THERETO FOR A HIGH-PERFORMANCE CONICAL VEHICLE **c05**
C. M. Ailman *In* Shock and Vibration Inform. Center The Shock and Vibration Bull., Pt. 4 Sep. 1978 p 159-169 refs (For primary document see N80-18213 09-31)
Avail: NRL Tech. Inform. Div., Washington, D.C.

A compiled data bank for describing the fluctuating pressures that force the shell of a non-maneuvering reentry vehicle to vibrate during reentry is presented, the use of local aerodynamic parameter values for the cone when predicting these pressures is discussed, and the characteristics of shell-mode vibration peculiar to a conical structure with a multilayered skin are described. Flight data are reported for such a structure maneuvering as a result of flow disturbance at the aft end. The data suggest some angle of attack dependencies not previously detected, and indicate low frequency response of the vehicle as a beam. The beam response is analytically examined as to its probable cause. K.L.

CALCULATION OF ATTACH POINT LOADS DUE TO POSSIBLE COMBUSTION INSTABILITY IN THE SPACE

SHUTTLE SOLID ROCKET BOOSTERS c20
F. R. Jensen and D. T. Wang *In* Shock and Vibration Inform. Center The Shock and Vibration Bull., Pt. 4 Sep. 1978 p 171-174 (For primary document see N80-18213 09-31)
Avail: NRL, Tech. Inform. Div., Washington, D.C.

The structural response of the Space Shuttle vehicle to possible acoustic combustion instability in the solid rocket boosters was analyzed. The response of the vehicle to pressure oscillations in the solid rocket boosters (SRB's) was calculated in terms of forces and displacements at the attach points between the SRB's and the External Tank (ET), and between the ET and the orbiter. The NASTRAN computer program was used to analyze various finite element shuttle models. A detailed finite element model of the solid rocket motor was constructed for use with the cyclic symmetry option in NASTRAN. The models were analyzed separately and results were combined to represent the total structure by using a mechanical impedance type approach. K.L.

A liquid reactant injector assembly suited for the injection of liquid reactant into a high temperature metal reductant vapor and carrier gas stream for the production of metal is presented. The assembly is especially adapted for the continuous production of high purity silicon by the reduction of SiCl4 with sodium. The assembly includes a refractory-lined, hollow metal shell having ten equally-spaced, concentric, radially directed ports provided in the shell and wall. A hydraulic, atomizing type spray nozzle is mounted in each of the ports recessed from the inner wall surface. Official Gazette of the U.S. Patent Office

STRUCTURAL EVALUATION OF RECYCLED PAVEMENT MATERIALS, VOLUMES 1 AND 2 Ph.D. Thesis
Dallas Neville Little, Jr. 1979 713 p
Avail: Univ. Microfilms Order No. 8003161

The principles of rational pavement analysis were used together with in situ nondestructive testing to evaluate the structural performance of recycled pavement materials under load. The recycled layers were compared to the conventional pavement layers of the AASHTO Road Test by means of The AASHTO structural layer coefficient. These coefficients describe the relative structural contribution of an asphalt concrete surface, a crushed stone base, and a gravel subbase to the pavement system. A rational technique utilizing nonlinear layered elastic theory and characterization of recycled asphalt bound materials in terms of resilient modulus as a function of temperature was used to develop structural coefficients for the recycled materials. The response of the recycled layer was compared to a reference layer of conventional construction at the same location using the stiffness equivalency factor concept. The results proved the recycled surfaces and bases to be generally stiffer and superior in terms of their ability to favorably distribute harmful stresses and strains than the conventional materials. Dissert. Abstr.

PREDICTION AND STATISTICAL ANALYSIS OF SETTLEMENTS OF SHALLOW FOUNDATIONS ON SAND Ph.D. Thesis
Michel Ragi R. Elias 1979 151 p
Avail: Univ. Microfilms Order No. 8004848

A proposed settlement formulation based on the theory of elasticity and the equivalent corrected blow counts is used to calculate the ratio, r, of measured settlements to calculated settlements of 67 shallow foundations on sand. The error in predicting settlement as estimated by the variance indicates that the proposed method results in an improvement over two recognized methods. The proposed method is considered to be consistent, and more reliable in the sense that the variance and uncertainty in the predicted settlements are known and can be accounted for. A hypothetical project involving the design of foundations on sand, from the standpoint of settlement considerations, is presented to illustrate a procedure of optimizing the total expected settlement related cost of the project, C sub T, which is expressed as a function of the number of test borings. In the optimization process, the optimum number of test borings that would minimize C sub T is determined. Dissert. Abstr.

N80-18234 Illinois Univ. at Urbana-Champaign.
RESILIENT BASED FLEXIBLE PAVEMENT DESIGN PROCEDURE FOR SECONDARY ROADS Ph.D. Thesis
Jose Ludwig Figueroa 1979 334 p
Avail: Univ. Microfilms Order No. 8004168

Easy to use and reliable algorithms to predict the resilient response of flexible pavements in terms of material properties and layer thicknesses are developed based on the data generated from a modified finite element program and an elastic layer stress-dependent program. Other research objectives are: (1) to establish the significance of subgrade resilient properties in determining pavement response to load; (2) to establish the significance of the damage caused to the pavement by loads applied during periods of critical subgrade support; (3) to study the influence on pavement response of using different types of granular base materials and to examine the possibility of developing thickness equivalence factors; and (4) to study the influences of base material shear strength on the development of failure zones within the pavement cross-section and on the pavement response to load. Dissert. Abstr.

RESISTANCE OF REINFORCED CONCRETE STRUCTURES UNDER HIGH INTENSITY LOADS Ph.D. Thesis
Theodor Krauthammer 1979 230 p
Avail: Univ. Microfilms Order No. 8004210

The resistance of reinforced concrete structural members subjected to high intensity loads such as that arising from a nuclear detonation, is studied for cases in which an equivalent static design approach can be employed as a basis for the proportioning of the structural components. A modified procedure for analyzing and designing reinforced concrete beams is developed. The method provides a basis for assessing the influence of the shearing reinforcement on the ultimate moment capacity of the beams. The procedure is employed to analyze simply supported reinforced concrete slender and deep beams and the results are compared to the experimental data. Dissert. Abstr.

N80-18236 Illinois Univ. at Urbana-Champaign.
A STUDY OF LOCAL MINIMA IN STRUCTURAL DESIGN Ph.D. Thesis
Bernardo Horowitz 1979 197 p
Avail: Univ. Microfilms Order No. 8004191

Structural design optimization problems are addressed. Design problems involving simple structural configurations amenable to graphical representation are discussed. The results obtained for those examples suggest that each local minimum corresponds to a specific way in which the structure may carry the applied loads. This motivates the concept of load carrying mechanisms. In order to be able to handle larger problems, an algorithm is developed which seeks to ensure convergence to a possible local minimum corresponding to the intended mode of behavior. For the case of single loads and stress constraints only, it is shown that the Lagrange multipliers represent the gradient vector of the functional that expresses the objective function in terms of the maximum member stresses. The method is applied to symmetric plane frames made up of prismatic members where the objective function is the total volume of material. Examples of structures subjected to single loading conditions and stress constraints only are studied to verify the generality of the concept of load carrying mechanisms. Dissert. Abstr.

N80-18237 Texas A&M Univ., College Station.
BEARING CAPACITY OF DRIVEN PILES IN SAND Ph.D. Thesis
Reno Reine Castello 1979 151 p
Avail: Univ. Microfilms Order No. 8003113

The unit point and side resistances obtained from thirty-four field pile load tests were used to determine which of the pile geometry and soil parameters are most significant. Bearing capacity factors are calculated and correlated with the most significant pile-soil system parameters. Three types of load test data are used: compression test data adjusted for residual stresses, unadjusted compression test data and compression/tension test data. The best and simplest correlations are developed by plotting the bearing capacity factors versus the relative depth, i.e., the depth of penetration to diameter ratio. An error analysis of these correlations provides the basis for the conclusion that both unadjusted compression and compression/tension test correlations yield fairly accurate predictions (usually within ±20%) for total bearing capacity. However, the compression/tension test correlations give the best predictions for point and side bearing capacity. Dissert. Abstr.

N80-18238 Massachusetts Univ., Amherst.
A STUDY OF THE STRUCTURE OF LIQUID HELIUM BY X-RAY SCATTERING Ph.D. Thesis
Howard Neil Robkoff 1979 263 p
Avail: Univ. Microfilms Order No. 8004980

The static structure factor of liquid He-4 was systematically measured over a wide range of temperature, pressure and momentum transfer, using a high intensity precision cryogenic X-ray diffractometer. The data at small momentum transfer extrapolate smoothly to the thermodynamic value for the k intercept. Generally, the effect of increasing the density at constant temperature is to heighten and sharpen the structure factor peak and displace it to slightly larger values of k. Agreement with the previous neutron measurements at elevated pressure by Mozer et al is excellent. A comparison with recent theoretical calculations for elevated pressure at OK reveals a sharper status structure factor peak in the experimental results. The effect of lowering the temperature at constant density is found to be an increase in the structure factor peak height up to the lambda transition. Further cooling is observed to result in a small but distinct decrement in structure. This decrease in structure persists to the lowest temperature studied. Dissert. Abstr.

N80-18239 Illinois Univ. at Urbana-Champaign.
EXPERIMENTAL STUDY OF FRAME-WALL INTERACTION IN REINFORCED CONCRETE STRUCTURES SUBJECTED TO STRONG EARTHQUAKE MOTIONS Ph.D. Thesis
Daniel Paul Abrams 1979 400 p
Avail: Univ. Microfilms Order No. 8004118

The response of reinforced concrete structures subjected to earthquake motions was studied. Reinforced concrete model structures were subjected to simulated earthquake motions. Each ten-story structure comprised two frames resisting lateral inertial loads in parallel with one slender structural wall. Geometry of each structure was the same, however, reinforcement was varied according to different concepts of intended behavior. Measurements at each level included accelerations, displacements, and forces resisted by wall. Strength of members was established according to a design method that recognized energy dissipation capabilities of reinforced concrete structures in the nonlinear range of response. A linear analytical model with arbitrarily softened members was used to estimate maximum response. Dissert. Abstr.

N80-18240 Illinois Univ. at Urbana-Champaign.
RESPONSE OF TEN STORY, REINFORCED CONCRETE MODEL FRAMES TO SIMULATED EARTHQUAKES Ph.D. Thesis
Haluk Cecen 1979 353 p
Avail: Univ. Microfilms Order No. 8004149

The elastic and inelastic response of reinforced concrete structures subjected to strong earthquake excitations was investigated for two identical test structures which were subjected to different numbers and intensities of base motions (principal variables of these tests). All the base motions were patterned after the El Centro-NS, 1940 earthquake. The original earthquake time scale was compressed by a factor, k = 2.5, in order to excite the test models in a way that would be compatible with the excitation of actual structures by real earthquakes. Several analytical methods and structural idealizations were evaluated by comparing the response calculated by them with the observed response of the test structures. A special formulation of a general method was used in an attempt to determine apparent member stiffness distributions at selected instants of a given response history. Dissert. Abstr.

N80-18241 Lehigh Univ., Bethlehem, Pa.
ANALYSIS AND DESIGN OF STEEL BEAM-TO-COLUMN WEB CONNECTIONS Ph.D. Thesis
Glenn Paul Bentschler 1979 390 p
Avail: Univ. Microfilms Order No. 8003068

Web connections were studied relative to their elastic behavior with regard to stiffness, stress distribution, and stress concentrations. The primary analytical tool used was the finite element method. Also included were experimental tests involving web connection details as well as web connection beam and column assemblages. Two types of connections were studied: (1) a connection where the beam flange is attached to the column via a flange connection plate which is welded or bolted to the beam flange and welded to the column flanges; and (2) a connection in which the beam flange is welded directly to the column web. Procedures are outlined for predicting the elastic stiffness of such connections. Dissert. Abstr.

N80-18242 Oklahoma State Univ., Stillwater.
A STUDY OF FLEXIBLE PAVEMENT CRACK DYNAMICS AND SEALANTS Ph.D. Thesis
Ismail Mouhamed Bash 1979 162 p
Avail: Univ. Microfilms Order No. 8003556

Laboratory test procedures for predicting field performance of flexible pavement crack sealing materials were evaluated. In addition, a field study of crack movements and behavior under varying load and temperature conditions was conducted in order to establish criteria for sealant performance based on average conditions on Oklahoma pavements. The bond-ductility test was found to offer the basic evaluative procedure for crack sealing materials. The rubberized asphalt was superior to the other tested sealants. The asphalt cements and the emulsions were found to be too stiff to withstand crack simulated straining actions. The geological formation underlying the pavement had an effect on subsequent cracking of the pavement and cracking behavior. The relative vertical displacement of the crack sides, which indicates the sealant shear strain, was approximately 10 percent of the horizontal crack movement. Dissert. Abstr.

THE INFLUENCE ON SPARK MACHINING EFFICIENCY OF THE TECHNIQUE FOR INDUCING DIELECTRIC CIRCULATION BETWEEN THE WORK MATERIAL AND THE ELECTRODE Final Report [INFLUENCE DU MODE DE CIRCULATION DU DIELECTRIQUE ENTRE LA PIECE ET L'ELECTRODE SUR LE RENDEMENT DE L'USINAGE PAR ELECTRO EROSION]
Dixmier 30 Nov. 1979 106 p In FRENCH
(CETIM-13-G-03-0) Avail: NTIS HC A06/MF A01

Dielectric circulation techniques in electro-erosion machining are reviewed. Several alternatives are discussed and practical rules of the selection of the optimum dielectric circulation technique for each case are given. The discussion includes the case of passing-through cavities, the influence of electrode shape and material, optimization of flow, and aspiration flow systems. It is shown that there are low and high limits to the acceptable dielectric flow and practical rules for the maximum length of dielectric circulation in the electrode gap are derived. Author (ESA)

METHODOLOGY FOR PREDICTING THE REFLECTION CRACKING LIFE OF ASPHALT CONCRETE OVERLAYS Interim Report, Sep. 1974 - Mar. 1979
Frederick P. Germann and Robert L. Lytton Mar. 1979 151 p refs Sponsored in part by Texas State Dept. of Highways and Public Transportation, Austin
(PB80-101710; TTI-2-8-75-207-5; FHWA/TX-79-09-207-5) Avail: NTIS HC A08/MF A01 CSCL 13B

An experimental testing procedure was established, for quantitative analysis of overlays designed to reduce reflection cracking. From this testing procedure the overlay scheme that shows the most resistance to cracking can be chosen. The procedure uses crack propagation tests on overlay samples which are conducted on a machine called the overlay tester. This machine was specifically built to stimulate the displacements resulting from temperature changes in the cracked or jointed pavement or base materials that are beneath an overlay. Various types of overlay samples were investigated on the overlay tester. These include samples with fabric, such as 'Petromat', and samples composed of different grades of asphalt. GRA

TEXTURING OF CONCRETE PAVEMENTS Final Report, Jun. 1973 - Aug. 1979
Sheldon M. Law and Masood Rasoulian Aug. 1979 54 p refs
(PB80-106032; RR-134; FHWA/LA-79-134) Avail: NTIS HC A04/MF A01 CSCL 13B

Research was conducted to document and evaluate the Category 2 Experimental Concrete Texturing project. Several texturing techniques, were tried and compared in order to determine which concrete pavement texture would perform best in regard to skid resistance, durability non hydroplaning properties, noise levels and uniformity. Initially transverse metal tines produced the highest skid number and the best speed gradient. It was recommended that the texturing technique of a longitudinal burlap drag followed by metal tines applied transversely to the centerline of the concrete pavement, be continued as standard on all new concrete pavements and bridge decks. HIGH-SPEED DATA LINK FOR MODERATE DISTANCES AND NOISY ENVIRONMENTS Patent
Michael W. Sievers, inventor (to NASA) (JPL) Issued 5 Feb. 1980 10 p Filed 25 Apr. 1978 Supersedes N79-24212 (17 - 15, p 1968) Sponsored by NASA
(NASA-Case-NPO-14152-1; US-Patent-4,187,394; US-Patent-Appl-SN-899828; US-Patent-Class-178-58R; US-Patent-Class-179-15BA) Avail: U.S. Patent and Trademark Office CSCL 17B

A full duplex, high speed data link is described which comprises identical modules at each site for communication over coaxial cables. Each module having a digital frequency modulation (DFM) transmitter with an first-in-first-out (FIFO) data buffer for data from a digital system to be transmitted over a cable and a receiver with an FIFO data buffer for data received for a digital system at the other end of the cable. Data words are preceded by a sync word which enables the receiver. Every word transmitted, including the sync word is stored in the FIFO data buffer. This arrangement using FIFO buffers allows for asynchronous transmission of data with receipt of the data beginning with the very first bit of the sync word.

RADIO FREQUENCY ARRAYING METHOD FOR RECEIVERS Patent
Milton H. Brockman (JPL) and Mahlon F. Easterling, inventors (to NASA) (JPL) Issued 29 Jan. 1980 15 p Filed 31 Oct. 1978 Supersedes N79-14272 (17 - 05, p 0585) Sponsored by NASA
(NASA-Case-NPO-14328-1; NASA-Case-NPO-14579-1; NASA-Case-NPO-14590-1; US-Patent-4,186,347; US-Patent-Appl-SN-956160; US-Patent-Class-325-305; US-Patent-Class-325-307; US-Patent-Class-325-419) Avail: US Patent and Trademark Office CSCL 17B

A method and apparatus for increasing the signal to noise ratio of a receiving facility for coherent frequency reception by arraying receiving systems using separate antennas for each, or one antenna for all systems are presented. One system is operated with a carrier tracking loop to provide a first local oscillator frequency for the first and all other systems arrayed, with individual tracking loops in all other systems operated at IF for tracking out any phase differences due to separate group delays using an adjustable phase shifter for a second reference to compensate for different group delays in the antenna and low noise amplifier of each of the other systems. The second IF output of all systems is summed into the first system. This technique may also be used when two systems are arrayed to an antenna designed for circular or linear polarization diversity reception to effectively provide the same signal to noise ratio for both polarized signal transmission channels that would result from matched polarization. An arrangement adapted to high rate telemetry reception is disclosed. With additional components, the same arrangement is adapted to provide low rate telemetry reception as well.

ANALYSIS OF ARBITRARILY SHAPED WIRE ANTENNAS RADIATING OVER A LOSSY HALF-SPACE Ph.D. Thesis
Parviz Parhami 1979 136 p
Avail: Univ. Microfilms Order No. 8004249

The problem of an arbitrarily oriented current element over a lossy half space is analyzed. Various numerical approaches are developed and discussed for evaluating the infinite Sommerfeld integrals appearing in the vector potential expressions. In particular, a technique based on the steepest descent path integration is introduced for exact evaluation of these integrals, and, as an efficient alternative, an additional technique is developed based on approximating the well behaved Fourier transform expressions of the Sommerfeld integrals. The latter technique has the merit of not requiring any time consuming infinite integrations and, at the same time, is shown to yield accurate results for a wide range of parameters of practical interest. Finally, the thin wire antenna problem over a lossy half space is analyzed via the method of moments and the current element solution techniques discussed earlier. Dissert. Abstr.

EVALUATION AND IMPROVEMENTS TO THE QUALITY AND INTELLIGIBILITY OF LINEAR PREDICTION VOICE CODING Ph.D. Thesis
David Yee-Yan Wong 1979 281 p
Avail: Univ. Microfilms Order No. 8003040

Linear prediction (LP) voice coding is discussed. The causes of the loss in speech quality are studied and techniques for improvements are explored. Low bit rate speech coding is attained with LP voice coding because of the explicit use of a linear speech model. The validity of the linear model and the accuracy with which its parameters are estimated by the LP algorithms are examined. From this examination, a number of problem areas which lead to quality degradation are defined. An evaluation is conducted to correlate the problem areas with the perceived quality defects in the vocoded speech. The evaluation consists of careful listening and analysis of speech samples produced by two different LP vocoder programs followed by a series of short experiments. Based on the preliminary evaluation, a study on the application of a more realistic excitation pulse for synthesizing voiced speech is conducted. A least squares technique for extracting the glottal volume velocity waveform from the speech waveform is developed and applied to several speech samples.

ELECTROMAGNETIC TRANSMISSION THROUGH A FILLED SLIT OF ARBITRARY CROSS SECTION IN A CONDUCTING PLANE OF FINITE THICKNESS Ph.D. Thesis
David Thomas Auckland 1979 137 p
Avail: Univ. Microfilms Order No. 8004485

Electromagnetic transmission through a filled slit in a conducting plane of finite thickness was investigated when the slit cross sections was an arbitrary shape. A non-modal formulation was developed whereby the original problem was broken up, via the equivalence principle, into three isolated situations. An integral equation was written for each of these situations involving equivalent electric and magnetic currents as unknowns on the closed contour defining the slit cross section. These three integral equations were solved simultaneously and it is shown that they have a unique solution at all frequencies. A modal solution was also developed for the case when the slit cross section can be viewed as a sequence of two dimensional rectangular cavities, each coupled to the other by an aperture. Results obtained from these two solutions are compared. Dissert. Abstr.

RADAR IMAGE SIMULATION: A PROJECT TO DEVELOP A MODEL, DEFINE ITS OPERATIONAL CONSTRAINTS, VALIDATE ITS ACCURACY, AND TO PRODUCE SAMPLE RESULTS, VOLUME 1 AND 2 Ph.D. Thesis
Verne Henry Kaupp 1979 552 p
Avail: Univ. Microfilms Order No. 8002808

A radar image simulation project was conducted to develop a model, to define its operational constraints, to validate its accuracy, and to produce sample results. Two different approaches to simulation of radar imagery were evaluated and resulted in two distinct models. The first of these models, the point scattering method (PSM), is applicable to simulation of area extensive, distributed targets. The second, the area spatial filtering (ASF) method, is applicable to simulation of specular reflection, cultural targets. Theoretical developments for both models are summarized, implementations are discussed, and sample results are presented. In addition, several ancillary studies performed in support of simulation are presented. Dissert. Abstr.

FM TRANSMISSION OF TELEVISION FROM ROCKETS AND BALLOONS Interim Report
Willard F. Thorn 11 Jul. 1979 58 p refs
(Contracts F19628-76-C-0111; F19628-76-C-0152; AF Proj. 7659)
(AD-A075489; SCIENTIFIC-3; AFGL-TR-79-0160) Avail: NTIS HC A04/MF A01 CSCL 17/2

This report deals with the use of preemphasis filtering in FM transmission of television. The television cameras and transmitter are to be located on rocket or balloon instrumentation payloads. The large RF bandwidth necessary for television transmission requires a large transmitted power for the distances of interest. The use of preemphasis will reduce the required transmitted power considerably below that required for a picture of similar quality without preemphasis. This thesis shows how preemphasis filtering can provide an improvement and what the limits of these improvements are. GRA

COMPARISON OF MEASURED DATA WITH IF-77 PROPAGATION MODEL PREDICTIONS Final Report
M. E. Johnson and G. D. Gierhart Aug. 1979 443 p refs
(Contracts DOT-FA78WAI-840; DOT-FA68WAI-145)
(AD-A076508; FAA-RD-79-9) Avail: NTIS HC A19/MF A01 CSCL 20/14

Measured propagation data were compared with predictions made by the IF-77 (ITS-FAA-77) and other propagation models. Although IF-77 was developed for aeronautical applications, it can be used for some point-to-point propagation paths, and the measured data selected for comparison includes point-to-point as well as aeronautical paths. Approximately 870,000 hours of data are associated with the 242 paths used. Predictions made with IF-77 were always best or second best and were substantially better than those made for free space conditions. The IF-77 model has a wide range of application and provides predictions compatible with the more specialized models tested. The aeronautical propagation data pool from which the data were selected is an appendix. A.R.H.

PICTURE DESCRIPTION INSTRUCTIONS (PDI) FOR THE TELIDON VIDEOTEX SYSTEM
H. G. Bown, C. D. OBrien, W. Sawchuk, and J. R. Storey Nov. 1979 74 p
(CRC-TN-699-E) Avail: NTIS HC A04/MF A01

The Telidon Videotex system is a method by which information is accessed from central data bases by the general public. By the use of a domestic home television receiver augmented by a microcomputer controlled interface device a user can access pages of graphical and textual information over a public common carrier communications facility such as the telephone network, a cable television line, or in a broadcast television signal. A coding scheme which encodes a picture into the geometric drawing elements which compose it is described. The picture description instructions are an alpha geometric coding model and are based on the primitives of POINT, LINE, ARC, RECTANGLE, POLYGON, point by point BIT encoded images, and TEXT encoded as ASCII characters. A detailed specification of the code as well as a description of the principles which make it independent of communications channel and display hardware is provided. A.W.H.

A FLUORESCENT RADIATION CONVERTER Patent Application
Walter Viehmann, inventor (to NASA) Filed 11 Jan. 1980 19 p
(NASA-Case-GSC-12528-1; US-Patent-Appl-SN-111439) Avail: NTIS HC A02/MF A01 CSCL 20N

A fluorescent radiation converter having a substantially undoped optically transparent substrate and a waveshifter coating deposited on at least one portion of substrate for absorption of radiation and conversion thereof to fluorescent radiation is described. The coating is formed of substantially 1000 g/liter of a solvent, 70 to 200 g/liter of an organic polymer, and .2 to 25 g/liter of at least one organic fluorescent dye. The incoming incident radiation impinges on the coating and enters therein. Radiation is absorbed by the fluorescent dye and is reemitted as a longer wavelength radiation. Advantages of the fluorescent radiation converter in the areas of liquid crystal displays, scintillation counters, and in photovoltaic conversion techniques are discussed. NASA

THE 30/20 GHz FIXED COMMUNICATIONS SYSTEMS SERVICE DEMAND ASSESSMENT. VOLUME 1: EXECUTIVE SUMMARY
R. B. Gamble, H. R. Seltzer, K. M. Speter, and M. Westheimer Aug. 1979 50 p 3 Vol.
(Contract NAS3-21366)
(NASA-CR-159619) Avail: NTIS HC A03/MF A01 CSCL 17B

Demand for telecommunications services is forecasted for the period 1980-2000, with particular reference to that portion of the demand associated with satellite communications. Overall demand for telecommunications is predicted to increase by a factor of five over the period studied and the satellite portion of demand will increase even more rapidly. Traffic demand is separately estimated for voice, video, and data services and is also described as a function of distance traveled and city size. The satellite component of projected demand is compared with the capacity available in the C and Ku satellite bands and it is projected that new satellite technology and the implementation of Ka band transmission will be needed in the decade of the 1990's. SYSTEM-DESIGN CONSIDERATION FOR AN OPTICAL CORRELATOR FOR THE SEASAT-A SYNTHETIC-APERTURE RADAR
E. B. Felstead Apr. 1979 81 p refs
(AD-A071358; CRC-1321) Avail: NTIS HC A05/MF A01 CSCL 17/9

System-design considerations are presented for an optical correlator that processes signals recorded on film from the

synthetic-aperture radar of the SEASAT-A satellite. A strip-map image of the Earth's surface is to be produced with a resolution down to 6.5 m along track (azimuth) and 25 m across track (range). The input film and the two-dimensional Fourier transform are described mathematically and their parameters given. Processing problems introduced by range curvature, antenna pitch and yaw, earth rotation, low PRF, etc., are handled by simple modifications to a standard tilted-plane correlator. Recommended system configurations, output parameters and system limitations are given. GRA

RADAR SURVEILLANCE/RADAR TRACKING VARIANT TO SPEARS
Mar. 1979 75 p Revised
(AD-A076147; NRL-7958-Rev) Avail: NTIS
HC A04/MF A01 CSCL 17/9

The AAW performance simulation designated SPEARS (System Performance Evaluation and Requirements Simulation) now exists in a version which contains extensive revisions in the areas of radar surveillance and radar tracking. To upgrade the capability of the SPEARS simulation of shipboard radar surveillance, a detailed radar-surveillance model designated SURSEM (Surveillance Radar Systems Evaluation Model) has been modified and incorporated into SPEARS. In addition, a simple tracking algorithm has also been added to replace the implicit assumption that a target track is established instantaneously upon initial detection and then carried automatically until the target either leaves the radar's coverage volume or terminates its flight. Due to time and financial constraints, this version of SPEARS has undergone only limited testing at present. GRA

THE USE OF LINEAR PREDICTION FOR THE INTERPOLATION AND EXTRAPOLATION OF MISSING DATA AND DATA GAPS PRIOR TO SPECTRAL ANALYSIS
Stephen B. Bowling and Shu T. Lai 18 Jun. 1979 23 p refs
(Contract F19628-78-C-0002)
(AD-A075515; TN-1979-46; ESD-TR-79-160) Avail: NTIS
HC A02/MF A01 CSCL 12/1

The spectral analysis of a series of equally spaced samples of a time-stationary process becomes difficult when samples are missing or sizable data gaps occur within the interval of interest. A linear prediction algorithm can be used to fill in the missing data with estimates that are spectrally consistent with the data that are observed. Simulated and practical radar examples demonstrate an improvement in resolution and a reduction of sidelobe interference levels. Computer programs are provided which accomplish the extrapolation and interpolation for complex data. GRA

STIMULATED - EMISSION - OF - ENERGETIC - PARTICLES (SEEP) EXPERIMENT Final Report
Sep. 1979 28 p refs
(Contract N00014-78-C-0755)
(AD-A075503; LMSC-D678462) Avail: NTIS
HC A03/MF A01 CSCL 20/14

The immediate scientific objective of this stimulated-emission-of-energetic-particles (SEEP) program is to experimentally establish the detailed relationship between ground-based VLF transmitter activity (i.e., operating frequency, signal strength, pulse duration and duty cycle) and the characteristics of the resulting particle precipitation (intensity, energy and pitch angle distribution). Once these relationships are established an assessment can be made of the feasibility of using controlled wave-particle interactions as a selective method of precipitating electrons from the radiation belts onto critical communication links in the ionosphere. With this knowledge corrective actions to mitigate the effects of such activity against existing and planned U.S. Navy communication systems can be pursued. GRA

ELF SFERIC OCCURRENCES IN THE ANTARCTIC DURING A SOLAR PROTON EVENT CASE STUDY OF OCCURENCES AT BYRD STATION DURING THE EVENT 9 JUNE 1968 Final Report, 1 Dec. 1977 - 30 Nov. 1978
A. C. Fraser-Smith and R. A. Helliwell 19 Sep. 1979 45 p refs
(Contract DNA001-78-C-0017)
(AD-A078923; AD-E300634; SU-SEL-79-005; DNA-4911F)
Avail: NTIS HC A03/MF A01 CSCL 04/1

Electromagnetic waves with frequencies above the extremely-low-frequency range (ELF; frequencies in the range 5 Hz-3) are susceptible to a variety of solar proton event (SPE) effects when propagating through a polar region in the earth-ionosphere waveguide. These effects appear to become less severe as the frequency of the waves becomes smaller and approaches the ELF range. Although measurements have been lacking, it would be expected that ELF wave propagation through the polar regions would be comparatively stable. To investigate polar ELF wave propagation during an SPE, we have carried out a series of measurements of the properties of ELF sferics (75 Hz) at a polar location (Byrd Station, Antarctica) during a moderately-large SPE. These measurements suggest that an SPE can significantly alter the characteristics of ELF signals propagating through the polar regions: during the first 24 hours of the SPE there was a reduction of about 50% in the median amplitudes of the sferics, compared with their amplitudes before the SPE, and there were substantial changes in their rates of occurrence. HC A12/MF A01 CSCL 17/5

A materials development and characterization program has been conducted with the goal of developing hardened antenna window materials for application to millimeter wave and infrared sensors for ballistic missile defense interceptor (BMDI) applications. Three distinct classes of materials were studied. The ADL-4D6 multidirectionally reinforced silica-silica composite developed in previous BMD work was tested for particle erosion resistance and dielectric properties in the mm wavelength region. A comprehensive study was also performed on the effects of constituent properties and weaving and composite densification variations on the mechanical properties of this material. A second class of refractory dielectrics, ultrahigh purity nitrides of silicon and aluminum, were also examined for their ultimate potential in the BMDI environment. Specimens were prepared by chemical vapor deposition and hot pressing of powders. These were variously tested for mechanical and thermal properties, chemical purity and dielectric properties in X and millimeter wavelength bands. The CVD Si3N4 material in particular showed a decade lower loss tangent than previously reported versions of this ceramic. A third material, 'Raytran' zinc selenide, an infrared window material candidate, was characterized for its thermophysical and mechanical properties from -150 C to 1000 C. GRA

THE EMP RESPONSE OF A SYSTEM OF UNCOUPLED, INTERCONNECTED CABLES
Robert F. Gray Oct. 1979 21 p
(DA Proj. 1L1-62120-AH-25)
(AD-A077659; HDL-TR-1903) Avail: NTIS HC A02/MF A01 CSCL 20/14

An approximate analytical technique is developed for the electromagnetic pulse (EMP) response of a complex system of cables deployed over a real earth. The technique involves an existing transmission-line solution for the EMP response of a cable which is extended to a system of interconnected but uncoupled cables by the principle of superposition. The complete response of one particular cable is found by replacing all the other cables connected to it with equivalent Thevenin sources. The response of the cable due to the EMP and the equivalent sources are then summed. The equivalent Thevenin sources are developed from the existing transmission-line solution for the EMP response of a single cable. Experimental verification of the applicability of the superposition principle to transmission lines is also given. GRA

In this article we present a multiple scattering analysis of the coherent wave propagation through an inhomogeneous medium consisting of either random or periodic distribution of scatterers of arbitrary shape. Both specific and random orientations of the scatterers are considered. The mathematical unity inherently present in the T-matrix formalism for the three wave fields, namely acoustic, electromagnetic and elastic, is employed in conjunction with suitable averaging procedures to formulate a self-consistent multiple scattering theory. For a random distribution of scatterers we use a configurational averaging procedure, while for a periodic distribution, we use a suitable lattice sum based on crystallographic theory. The information about the orientation of the scatterers has been incorporated into the T-matrix of the scatterer itself thus making formalism a convenient computational scheme to study the anisotropic effects in an inhomogeneous medium. The statistically averaged equations obtained by the analysis are then solved by using Lax's quasicrystalline approximation to obtain the bulk or effective properties of the medium. Numerical results are presented for propagation speeds, attenuation and frequency dependent elastic properties for a range of frequencies to demonstrate the broad applicability of the T-matrix method. HARDENED RADAR COMPONENT MATERIALS DEVELOPMENT STUDY Final Report, 28 May 1978 - 30 Jan. 1979
Irving Osofsky and Robert Semelsberger May 1979 255 p refs
(Contract DAAG46-78-C-0052; DA Proj. 8X3-63304-D-215)
(AD-A077805; AMMRC-TR-79-34) Avail: NTIS HC A12/MF A01 CSCL 17/9

A combined analytical and experimental study was conducted to identify and evaluate materials for protecting Ballistic Missile Defense system ground radar components from nuclear thermal radiation damage. This program included thermal testing using the French Solar Furnace and the SAI Thermal Radiation Simulator, electrical property tests at the Georgia Institute of Technology, Engineering Experiment Station, and planning of mechanical property tests to be conducted in the BMD Materials Test facility at AMMRC. Materials included bulk ceramics, ceramic coatings and bulk ablators. The results indicated promise for the use of a silicone rubber ablator and uninfiltrated porous ceramic coatings for radar component thermal hardening. Further tests and analyses are recommended for these classes of materials in order to evaluate the effect on radar performance. GRA

(AD-A078478; RADC-TR-79-243) Avail: NTIS HC A08/MF A01 CSCL 17/9

This final report documents the results of a six-month study conducted during phase 1 of a contract to examine Signal Processing for Unattended Radars. Based on a general set of system and processor requirements for a representative unattended radar, various signal processing operations, architectures, and technologies are evaluated. A recommended signal processor is identified, and the selection rationale is presented. The principle selection criteria are those of reliability, performance, cost, maintainability, risk and power consumption. The major risk areas in the selected processor have been identified and a validation plan proposed for phase 2 of the SPUR effort. This plan consists of recommended approaches, including a formal test plan, for reducing these risks. GRA

THE SENSITIVITY OF SATELLITE COMMUNICATIONS TO THE UNCERTAINTIES IN SELECTED CHEMICAL REACTION RATE COEFFICIENTS Final Report, Apr. 1977 - Feb. 1979

Murray Scheibe 31 May 1979 55 p refs
(Contract DNA001-77-C-0224)
(AD-A078924; AD-E300633; MRC-R-458; DNA-4971F) Avail: NTIS HC A04/MF A01 CSCL 20/14

The relative importance of various reaction rates are examined using the results of a recent MELT code calculation for a megaton range burst at 250 km altitude. New rate coefficients are developed for the critical reactions involved in the ion decay and the uncertainties in these rate coefficients are examined. With the use of a number of assumptions, some of them rather crude, these rate coefficient uncertainties are translated into uncertainties in communications degradation effects for HF and higher frequencies and some of these are significant. Areas in which improvement is needed, with regard to both reaction rate data and the chemistry treatment in MELT, are noted. GRA

AN X-BAND ARRAY ANTENNA MODULE WITH GaAs IMPATT DIODE AMPLIFIER. VOLUME 1: TEXT
Herbert Steyskal Apr. 1979 76 p refs In SWEDISH; ENGLISH summary 2 Vol.
(FOA-C-30155-E1-Vol-1) Avail: NTIS HC A05/MF A01

The construction of a MIC twin transceiver module is described. It contains three stage GaAs IMPATT diode amplifiers with 1 W cw output and 20 dB gain at 9 GHz, analog ferrite phase shifters, PIN-diode switches, and balanced mixers. Test methods for transmitter and receiver branches are described and test results broken down into transmitter, receiver, and control elements characteristics are reported. Emphasis is on phase data as functions of temperature, voltage, and time. Phase and amplitude tracking at constant voltage or constant current were measured for a changing ambient temperature. The ICW operation of the transmitter branches on low duty cycle was tested and results concerning amplification and intrapulse phases shift are discussed. Author (ESA)

CONTRIBUTIONS OF OPTIMAL RECEIVER THEORY TO DIGITAL EQUALIZATION [APORTACION DE LA TEORIA DEL RECEPTOR OPTIMO A LA IGUALACION DIGITAL]
Jesus Rivero Laguna 1979 58 p refs In SPANISH
(ETSI-04-176) Avail: NTIS HC A04/MF A01

Data transmission through telephonic channels was analyzed with emphasis on optimal receiver theory. An optimized analog filter structure was studied and its influence on the received signal was determined. The modifications derived from the insertion of a digital filter were surveyed and optimal detection algorithms were examined. It is concluded that the equalization of the telephonic channel for data transmission can be reduced to the design of a digital filter, leaving out the nonlinear optimal detectors if the intersymbol interference is not too strong. A voltage feed-through apparatus, having reduced partial discharge, has an electrical conductor and an electrical terminal connected thereto. A semiconductor sleeve surrounds the conductor for reducing the electric field concentration at the metallic conductor surface and consequently reducing the partial discharge occurrences. An insulator sleeve encircles the semiconductor sleeve. A metallic sleeve surrounds a portion of the terminal. Another insulator is connected to the metallic sleeve and surrounds a portion of the insulator sleeve forming a space therebetween. Another metallic sleeve spaced from the first metallic sleeve surrounds a portion of the other insulator.

A system in which the characteristics of a microwave power transmission beam are controlled in accordance with power distribution profiles altered due to the detected presence or entrance of an object into the beam which causes changes that are perceived in various received, reflected and scattered power distribution profiles resulting over various receiving elements of the system is presented. The system comprises a microwave power beam radiator array, a microwave power beam receiving antenna array, the radiator array in one embodiment being located on an orbiting spacecraft and the receiving array being located at a ground station. Another embodiment provides a ground based transmitting array and a receiving array aboard an aircraft or airship.

DETECTION, ESTIMATION, AND ORDER REDUCTION IN MULTIPARAMETER SINGULARLY PERTURBED SYSTEMS Ph.D. Thesis
Dean Altshuler 1979 105 p
Avail: Univ. Microfilms Order No. 8004123

The problem of state estimation for the slow modes of a hierarchial singularly perturbed system is considered. A detection estimation approach is derived which obtains near optimal estimates in the presence of multiple perturbation parameter uncertainties. The scheme is of most value when the estimation problem is one of a steady state nature. However, small sample performance is analytically derived. Since the algorithm always contains a near optimal filter corresponding to the unknown perturbation parameters, questions of convergence need not be considered. A second problem that is addressed is that of obtaining a steady state slow mode estimate when the perturbation parameter is not small. It is shown that in many cases, a near optimal solution exists that is easily implementable. Its performance, in general, is superior to the reduced filter, yet its complexity is comparable. Dissert. Abstr.

A METHOD FOR THE TRANSIENT STABILITY ENHANCEMENT OF A POWER SYSTEM USING FEEDBACK CONTROL OF A SYNCHRONOUS GENERATOR Ph.D. Thesis
Haren Almaula 1979 97 p
Avail: Univ. Microfilms Order No. 8003339

A control strategy for augmenting the transient stability of a power system is developed using a direct phase model of a synchronous generator. The strategy uses prime-mover power and the excitation voltage of the synchronous generator as the controller variable. The control problem is formulated as a sequence of linear optimal control problems, where the control law is obtained from the backward solution of a Riccati type, matrix differential equation. Two different conditions of transient instability of a power system are considered. In each case the control strategy counters the instability resulting from a three phase-to-ground fault near the synchronous generator. The control strategy is applied only after the fault is removed. A gain of one cycle in the transient stability limit is observed in each case. Dissert. Abstr.

ELECTRON AND HOLE PHOTOCURRENT EFFECTS ON IMPATT OSCILLATORS Ph.D. Thesis
Hanuman Prasad Vyas 1979 155 p
Avail: Univ. Microfilms Order No. 8004770

The effect of the magnitude and composition of leakage current on IMPATT oscillator performance is experimentally and theoretically evaluated. The principal effect of leakage current is to cause a reduction in the diode RF power output and an increase in the frequency of oscillations. The electron dominated leakage currents are more effective in reducing the RF power output and increasing the frequency of oscillations of an Impatt oscillator compared to leakage current dominated by holes. For experimental demonstration of leakage current effects flat profile, single drift region Impatt diodes were fabricated. A He-Ne laser was used as an optical source and the composition of leakage current with this source is changed by fabricating two types of devices. One with junction side down or flip chip to generate hole dominated leakage current and other with junction side up or top mounted to generate electron dominated leakage current. Dissert. Abstr.

THEORY AND DESIGN OF CYCLOTRON-WAVE TRAVELING-WAVE AMPLIFIERS Ph.D. Thesis
Arthur Herman Gottfried 1979 277 p
Avail: Univ. Microfilms Order No. 8002664

The energy exchange mechanism and the axial beam velocity spread induced by RF interactions are examined. Analysis of the energy spread in a realistic model of the beam with nonzero size and nonzero space-charge density shows that higher maximum efficiencies at higher power is attainable (with collector depression) in cyclotron-wave amplifiers than in synchronous-wave amplifiers. A one-watt, and a ten-watt cyclotron-wave amplifier at 3 GHz, utilizing bifilar helix circuits, scaled from a 2 kW, 5 GHz design, were constructed. A computer was used to design a pitch taper for the circuit of the ten-watt tube to maintain synchronism between beam and circuit waves so as to enable the extraction of more energy from the beam. Test results indicate the possibility of attaining efficiencies of the order of 70% in a 2 kW, 5 GHz cyclotron-wave amplifier. Because of the relatively low interaction impedance available for transverse-wave interactions, it is estimated that gains of the order of 1 dB/inch are possible. Dissert. Abstr.

N80-18293 Missouri Univ. - Columbia.
PARALLEL DIGITAL SIMULATION OF POWER SYSTEMS Ph.D. Thesis
Alvin Lawrence Day 1979 223 p
Avail: Univ. Microfilms Order No. 8002351

A quadrature differential equation simulation technique suitable for parallel digital processors is developed. Parallel digital architectures are suggested which provide modular construction to allow expansion, modification, and easier maintenance of the simulator. The solution speed of the proposed fully programmable power system simulator is independent of the size of the simulated system. Detailed model equations are developed for several basic power system components using the quadrature differential equation technique. This technique of simulation is shown to be valid by comparisons with a conventional sequential digital program and a hybrid simulator. Faster than real time simulation with the TMS 9900 is shown to be possible by the substitution of a TMS 9900 steam turbine model into an analog simulation system scaled at twenty times faster than real time. Present microprocessors are feasible for simulation of only the slower solution rate models of a power system. The faster components may be simulated by either analog electronics or discrete digital hardware. Dissert. Abstr.

N80-18294 California Univ., Davis.
THE EFFECT OF NONUNIFORM CHANNEL DOPING ON HIGH FREQUENCY JFET AND MESFET DEVICES Ph.D. Thesis
Giovonnae Francesca Anderson 1979 155 p
Avail: Univ. Microfilms Order No. 8003495

A new load device for use in high speed switching circuits is presented. The device, a non-uniformly doped junction field effect transistor (NUDJFET), has a doping gradient along the length of the channel, that is, the doping at the source end of the channel is higher than the doping at the drain end of the channel. A model for this device was developed and used in computer simulations which compared gallium arsenide high speed switching circuits which used NUDJFETs as a load device with circuits employing conventional load devices. According to simulations, circuits using GaAs NUDJFETs should show a reduction in the speed power product ranging from 42% to 12% depending on the circuit configuration. Dissert. Abstr.

N80-18295 Alabama Univ., University.
DEVELOPMENT OF EQUIVALENTS FOR ELECTRIC POWER SYSTEM TRANSIENT STABILITY ANALYSIS Ph.D. Thesis
Nallicheri J. Balu 1979 208 p
Avail: Univ. Microfilms Order No. 8004528

The simplified representation of an external system was constructed in two stages: (1) a dynamic equivalent for reducing the number of generator terminal buses in the external system, and (2) a network equivalent for eliminating the unwanted nongenerator buses in the external system. The dynamic equivalents was developed based on the principle of coherency of generating units. A novel analytical technique, based on the study of trajectories of a power system in a state space was developed for the recognition of coherent machine groups during system disturbances. Two coherency-based techniques for the construction of dynamic equivalents of external systems are discussed, and computer programs were developed for the implementation of these techniques. The practical applicability and the accuracy of each of these two techniques is demonstrated. Dissert. Abstr.

N80-18296 Illinois Univ. at Urbana-Champaign.
STATE ESTIMATION OF LINEAR SYSTEMS DRIVEN SIMULTANEOUSLY BY WIENER AND POISSON PROCESSES Ph.D. Thesis
Samuel Horshing Poriza Au 1979 116 p
Avail: Univ. Microfilms Order No. 8004127

The case where the incident intensities of the Poisson processes are low and the system is observed in an additive white Gaussian noise is considered. The minimum mean-squared-error (MMSE) optimal filter is derived via the Doleans-Dade and Meyer differentiation rule for discontinuous semimartingales and its corresponding basic filtering theorem for white Gaussian observations noise. The nonclosedness property and performance of the filter are investigated. The results together with the performance of the linear optimal filtering schemes lead to the conclusion that causal filters and noncausal linear filters are inherently unsuitable for the state estimation for such class of systems. A noncausal nonlinear suboptimal scheme is developed for the estimation problem based on a combined estimation and detection strategy. A first order approximation scheme is included in the scheme to eliminate the error propagation effects that result from the sequential structure of the approach. Dissert. Abstr.

N80-18297 Toledo Univ., Ohio.
ANALYTICAL CORE LOSS CALCULATIONS FOR MAGNETIC

MATERIALS USED IN HIGH FREQUENCY HIGH POWER CONVERTER APPLICATIONS Ph.D. Thesis
James Edward Triner 1979 101 p
Avail: Univ. Microfilms Order No. 8002826

The basic magnetic properties under various operating conditions encountered in the state-of-the-art dc-ac/dc converters were examined. Using a novel core excitation circuit, the basic B-H and loss characteristics of various core materials were observed as a function of circuit configuration, frequency of operation, input voltage, and pulse-width modulation conditions. From this empirical data, a mathematical loss characteristics equation was developed to analytically predict the specific core loss of several magnetic materials under various waveform excitation conditions. Core excitations involving symmetric and asymmetric conditions for both sinusoidal and square wave waveforms were investigated analytically using three specific core loss calculation methods. The predicted and measured specific core losses were within 10 percent of each other for all conditions analyzed. Dissert. Abstr.

(Contract NAS1-14290)
(NASA-CR-3218; Rept-08-78-49) Avail: NTIS HC A09/MF A01 CSCL 09A

A variety of charged coupled devices (CCDs) for performing programmable correlation for preprocessing environmental sensor data preparatory to its transmission to the ground were developed. A total of two separate ICs were developed and a third was evaluated. The first IC was a CCD chirp z transform IC capable of performing a 32 point DFT at frequencies to 1 MHz. All on chip circuitry operated as designed with the exception of the limited dynamic range caused by a fixed pattern noise due to interactions between the digital and analog circuits. The second IC developed was a 64 stage CCD analog/analog correlator for performing time domain correlation. Multiplier errors were found to be less than 1 percent at designed signal levels and less than 0.3 percent at the measured smaller levels. A prototype IC for performing time domain correlation was also evaluated. R.C.T.

LIQUID METAL SLIP RING Patent Application
Frank D. Berkopec, Robert R. Lovell, and David H. Culp, inventors (to NASA) Filed 21 Dec. 1979 11 p
(NASA-Case-LEW-12277-3; US-Patent-Appl-SN-106190) Avail: NTIS HC A02/MF A01 CSCL 09A

The liquid metal slip ring described comprises a rotor in the form of a range about an axis and a stator, the rotor being rotatable relative to the stator. The rotor has a channel in which the liquid metal is retained during operation by surface tension. The stator comprises a brush or probe which is partially immersed in the metal in the channel and is bidirectionally symmetrical so that whichever direction the rotor turns the probe presents the same physical resistance and affords the same electrical conductivity as a connection between the probe and the rotor. THERMIONIC CATHODE LIFE TEST STUDIES
Ralph Forman and Paul Elmer (Watkins-Johnson, Palo Alto, Calif.) 1980 11 p refs Proposed for presentation at the Tri-Services Cathode Workshop, New York, 15-17 Apr. 1980; sponsored by Dept. of the Air Force
(NASA-TM-81441; E-317) Avail: NTIS HC A02/MF A01 CSCL 09A

An update on the life testing of commerical, high current density impregnated tungsten cathodes is presented. The B-type cathodes, operated at a current density of 2 A/cm2 and a cathode temperature of 1100 C have now been run satisfactorily for more than four years. The M-cathode, at the same current density but at an operating temperature of only 1010 C, have been tested for more than three years. The M-cathodes show no degradation in current over their present operating life whereas the current from the B-cathodes degrade about 6 percent after four years of operation. R.E.S.

The GaAs dual-gate MESFET is a very powerful microwave device offering more gain and a wider range of functional capabilities than a conventional single-gate FET. It has also been demonstrated that the dual-gate FET can be switched from full off to full on in less than 50 psec. Combining the high gain

and fast switching speed of this device with its inherently high isolation makes it an attractive candidate for microwave switching applications. This report describes the progress made during the first year of an effort to demonstrate the feasibility of using dual-gate FET's as high speed, broadband, lossless microwave switches. In this period, we have designed and fabricated two different dual-gate FET structures which functionally operate as multipole, multithrow switches with gain. We have achieved gains of 18 dB at 10 GHz from a more conventional dual-gate structure. This result is comparable to the best reported in the literature. We have also measured on-off ratios in excess of 30 dB and channel-to-channel isolation in excess of 25 dB in a multiport structure. Due to the many difficulties in handling multiport structures such as these, we have not yet been able to demonstrate signal switching. However, near the end of this report period we developed a new measurement technique which has the potential of eliminating many of the existing difficulties. GRA

AN ANALYTIC ANALYSIS OF A KALMAN FILTER AND SMOOTHER
B. Billard Jul. 1979 26 p refs
(AD-A076140; ERL-0087-TR) Avail: NTIS HC A03/MF A01 CSCL 09/3

A Kalman filter and smoother which uses data from position measuring instrumentation to estimate changes in position, velocity, and acceleration is derived in detailed analytic form. The filtering and smoothing characteristics are shown to be completely determined by a single nondimensional parameter, which itself is a simple function of the input parameters to the filter. The concept of the bandwidth of the filter and the smoother is examined, and analytic expressions are derived for the bandwidth of the smoother, and of the filter with respect to position. The analysis highlights situations in which the smoother is clearly superior to the filter. GRA

PERFORMANCE ANALYSIS OF A TYPE OF ELECTROHYDRODYNAMIC POWER GENERATOR
T. H. Gawain and Oscar Biblarz Apr. 1979 91 p
(AFOSR MIPR 78-0002)
(AD-A076115; NPS67-79-006) Avail: NTIS HC A05/MF A01 CSCL 10/2

This report develops a detailed analysis of a type of electrohydrodynamic power generator which employs an ejector and a so-called 'fluid flywheel' as essential components. The medium is steam containing electrically charged water droplets. The analysis takes into account the experimentally established facts that the maximum strength of the electrical field that can be sustained at incipient breakdown at the most critical location is proportional to the fluid density at that location. It is shown that as a consequence of this fact, the electrical output can be maximized by designing the primary jet for an exit Mach number of 0.71. Estimates are made of the pump work required, of mixing losses in the ejector and of friction and secondary flow losses. The mathematical analysis is reduced to a fully nondimensional form and the key dimensionless parameters that govern performance are clearly identified. A preliminary estimate is made of the numerical values of these parameters and the overall performance of the system is estimated on this basis. GRA

NO-LOAD TESTING OF THE SHAPED FIELD SUPERCONDUCTIVE MOTOR Final Report
H. N. Robey, M. J. Cannell, and L. T. Dunnington Oct. 1979 60 p refs
(AD-A076125; DTNSRDC-79/076) Avail: NTIS HC A04/MF A01 CSCL 09/5

A laboratory-model superconductive d.c. motor, designed and constructed at the David W. Taylor Naval Ship Research and Development Center for peak power output in the 400 to 1000 hp range, has been undergoing no-load testing since January 1973. Results, reported herein, substantially validate the loss estimates (6.5 kW total power loss at 1800 rpm, 120 amp field current, open circuit) predicted in a prior analysis, and indicate that no major problems should be encountered in future planned load tests, with the possible exception of the collector electromagnetic stability, which cannot be evaluated satisfactorily at no-load conditions. Background information on machine development and discussions of the liquid metal and cryogenic helium handling procedures are also included. GRA

BONDED GRID DEVELOPMENT Final Technical Report, 1 Feb. 1978 - 31 Jan. 1979
Richard Dawson Griffiss AFB, N.Y. RADC Oct. 1979 83 p refs
(Contract F30602-78-C-0101; AF Proj. 4506)
(AD-A078631; RADC-TR-79-249) Avail: NTIS HC A05/MF A01 CSCL 09/1

This report details the results of efforts expended towards the development of a cathode and control grid assembly having the control grid solidly bonded to the cathode surface by means of a layer of insulating material. A device capable of emission and modulation was fabricated and tested. This effort demonstrated the feasibility of a control grid for microwave tubes fabricated with lithographic techniques directly on the cathode surface. When perfected this technique has two primary payoffs: (1) It will permit the use of high gain control grids at higher frequencies than possible with present shadow grid construction techniques, (2) It will also improve tube reliability, yield and construction cost. This technique will be applicable to microwave tubes used in tactical and ground based radars as well as ground based and satellite communications systems. GRA

This report addresses the problem of high-resolution fault diagnosis in linear, analog electrical circuits in which a limited number of terminals are accessible for measurement. An efficient algorithm is described for computing network responses after a single parameter is changed. The computational complexity of this algorithm has been found to be very superior to that of a conventional algorithm. In addition, the problem of choosing a set of measurements for fault analysis has been studied. We have found necessary conditions for resolving the fault to the component level. The problems of measurement error and numerical conditioning have also been studied. GRA

INVESTIGATION OF THE BASIC MECHANISMS OF RADIATION EFFECTS ON SEMICONDUCTOR DEVICES USED IN ELECTRO-OPTICAL SENSOR APPLICATIONS Final Report, Jan. 1978 - Jan. 1979
Joseph R. Srour, Siegfried Othmer, Susan C. Chen, and Robert A. Hartmann 31 Aug. 1979 147 p refs
(Contract DNA001-78-C-0028)
(AD-A076940; AD-E300617; NRTC-79-9R; DNA-4881F) Avail: NTIS HC A07/MF A01 CSCL 09/1

This report describes results of an investigation of radiation effects on semiconductor devices used in electro-optical sensor applications. Emphasis is placed on determining the basic mechanisms of the interaction of radiation with such devices with a view toward gaining understanding of benefit to developers of radiation-tolerant devices. A study of ionizing radiation effects on silicon MOS devices was performed at temperatures ranging from 4 to 77 degrees K. Charge buildup in the SiO2 layer was observed to be identical at 4 and 77 degrees K after a steady-state exposure to ionizing radiation, which indicates that electron trapping is not important at 4 degrees K. Results at both temperatures can be accounted for quite well in terms of hole trapping and hole transport. An investigation of the basic mechanisms of radiation effects on extrinsic silicon detector material was initiated. Carrier removal produced by neutron bombardment of such material was studied and it was found that the introduction rate of compensating defects depends strongly on the depth within the forbidden gap of the intentional dopant level. A detailed study of radiation effects on charge-coupled devices was performed, with emphasis placed on examining changes in dark current density produced by bombardment with neutrons and with ionizing radiation. The rate of increase in dark current density was found to be very similar for neutron-irradiated buried-channel CCDs obtained from two sources. Results of short-term annealing measurements on CCDs following pulsed neutron bombardment are also presented. A damage coefficient appropriate for describing the introduction of damage in silicon depletion regions was experimentally determined. GRA

THE ELECTRICAL SWITCHING PROPERTIES OF AMORPHOUS BISMUTH TRIOXIDE THIN FILM DEVICES Final Report, 1978 - 1979
R. Stephen Weis 9 May 1979 58 p refs
(AD-A077662; USNA-TSPR-101) Avail: NTIS HC A04/MF A01 CSCL 20/12

Many gold-amorphous bismuth trioxide-gold layered devices, known as Bi-O-Trons were fabricated and their switching properties were investigated. The Bi-O-Trons were made by direct vacuum deposition. A unique microprocessor controlled measurement method was developed. This report also contains evidence that filaments can be formed by exclusively thermal effects. Also, evidence that suggests an electrothermal model of threshold switching is presented and discussed. Finally a conclusion about the possibility of the immediate application of Bi-O-Trons as memory cells is presented. GRA

THE INSTABILITY BOUNDARY AND GROWTH RATE CONTOURS OF THE GYROTRON AMPLIFIER WITH SPREADS IN ENERGY AND MOMENTA
Joon Y. Choe and Saeyoung Ahn 14 Nov. 1979 13 p refs
(AD-A077450; NRL-MR-4106) Avail: NTIS HC A02/MF A01 CSCL 09/5

The combined effects of the spreads in energy and axial momentum of annular beam electrons in a gyrotron amplifier are spectrally investigated. A conveniently normalized dispersion relation is found for TE modes, and analyzed to obtain the instability boundary and growth rate contours. The spread effects prove to reduce the growth rate near the beam-waveguide synchronous mode, and enhance it for the mode out of synchronization. In particular the growth rate at the synchronous mode tends to peak when the electron distribution is thermally isotropic. GRA

A FUNCTIONAL APPROACH TO THE STATISTICAL MECHANICS OF FLUID PARTICLES IN TURBULENCE Ph.D. Thesis
Taylan Alankus 1979 95 p
Avail: Univ. Microfilms Order No. 8004403

A turbulence formalism based on the generating functional for the probability density functions of a turbulent Eulerian velocity field is presented. For incompressible fluids it is shown that the generating functional coincides with the characteristic functional of a random scalar field which can be considered as the microscopic density for fluid particles. The dynamical equations for the microscopic density and the generating functional are derived, and it is demonstrated at the functional level that the whole formalism is mathematically indistinguishable from the statistical dynamics of a closed system of (many) identical particles interacting with velocity dependent and dissipative forces. The dynamical equation for the generating functional is formally solved by using functional integration technqiues, and the integral representations of the probability density functions are given. Some fluid dynamical model equations for which the integral representations can be evaluated explicitly are considered. Dissert. Abstr.

A NUMERICAL INVESTIGATION OF THE TWO STREAM INSTABILITY AND RESONANT HEATING OF AN INHOMOGENEOUS, AXISYMMETRIC, PLASMA COLUMN Ph.D. Thesis
Mohammad Taghi Ahmadian 1979 185 p
Avail: Univ. Microfilms Order No. 8002745

An inhomogeneous, cylindrically axisymmetric electron plasma confined electrostatically by immobile ions and with an external boundary surface is considered. A two stream instability excited by axial counter-streaming is followed through limiting amplitude for one or two unstable wavenumbers. The results show that the limiting amplitude is largest for the wavenumber with largest growth rate, consistent with the one-dimensional result. In the case of multiple unstable waves, the first wave to reach limiting amplitude modifies the distribution function and 'turns off' the instability before the other waves reach the limiting amplitudes they would attain as isolated waves. An electric field is applied on the boundary of the plasma along the axis of the cylinder. Power amplification through a thermonuclear fusion reaction is achieved by using the wave to speed up particles on the tail of the distribution function. The maximum power amplication occurs at a frequency omega = 1.3 omega(p). Dissert. Abstr.

N80-18327 Illinois Inst. of Tech., Chicago.
HEAT, MASS AND MOMENTUM TRANSFER THROUGH SPRAYS Ph.D. Thesis
Mohan L. Jain 1979 293 p
Avail: Univ. Microfilms Order No. 8003649

An experimental facility consisting of a subsonic wind tunnel, a spray generation system and instrumentation was designed and constructed. A numerical-photographic procedure was developed for analyzing drop trajectories to imply drop drag coefficients. Experiments were conducted over a Reynolds number range of 1000-3500, and it was found that the drops in the sprays of the present type experience up to 18% higher drag than single drops. Thermal experiments to determine average heat and mass transfer through sprays were conducted over a Reynolds number range of 1000-2500 for three different spray

configurations involving two volume fractions. It is shown that the widely used Ranz-Marshall correlations for single drops give too high a prediction for heat and mass transfer in the present system. Only 36-67% of the calculated transport actually occurred over the Reynolds number range studied. Dissert. Abstr.

N80-18328 Florida Univ., Gainesville.
ANALYTICAL AND EXPERIMENTAL INVESTIGATION OF THE EFFECT OF DYES ON SOLAR DISTILLATION Ph.D. Thesis
Anil Kumar Rajvanshi 1979 203 p
Avail: Univ. Microfilms Order No. 8002890

A model was developed which treated the transient heat transfer inside the dye-water system as one dimensional. Coupled with this was the energy exchange from the surface of water to the glass cover by convection, radiation and evaporation of water. A finite difference technique was used in solving the nonlinear partial differential equations. The results from the model were compared with those from an experimental investigation using two identical solar stills (4 ft. x 4 ft. x 1 ft.). The control still contained water only while the other had dye-water solution. The dyes used were Black Napthylamine, Red Carmoisine and Dark Green, with various concentrations. An increase in distillate output resulted with increasing dye concentration, but became independent of concentration after 500 ppm. The change of increase of output with concentration of the dye was different for different dyes (among those tested) with Black having the maximum rate and Red having the lowest. For the spring conditions at Gainesville, Florida, the optimum concentrations for Black, Green and Red dyes were 218 ppm, 377 ppm and 408 ppm, respectively. Dissert. Abstr.

N80-18329 Old Dominion Univ., Norfolk, Va.
EFFECT OF PRECURSOR HEATING ON RADIATING AND CHEMICALLY REACTING VISCOUS FLOW AROUND A JOVIAN ENTRY BODY Ph.D. Thesis
Kuo-Yen Szema 1979 185 p
Avail: Univ. Microfilms Order No. 7927104

The influence of changes in the precursor region flow properties (resulting from absorption of the radiation from the shock layer) on the entire shock layer flow phenomena around a Jovian entry body was investigated. Realistic thermo-physical and radiation models are used and results are obtained by employing the implicit finite difference technique in the shock layer and an iterative procedure for the entire shock layer-precursor zone. Results obtained for a 45 deg hyperboloid blunt body entering the Jupiter's atmosphere at zero angle of attack indicate that pre-heating of the gas significantly increases the static pressure and temperature ahead of the shock for entry velocities exceeding 36 km/sec. The nonequilibrium radiative heating rate to the body is found to be significantly higher than the corresponding equilibrium heating. The precursor heating, in general, increases the radiative and convective heating to the body, and this increase is slightly higher for the nonequilibrium conditions. Dissert. Abstr.

N80-18330 Oklahoma State Univ., Stillwater.
LAMINAR FREE CONVECTIVE HEAT TRANSFER IN THE SUPERCRITICAL REGION WITH VARIABLE FLUID PROPERTIES Ph.D. Thesis
Afshin Jahanshahi Ghajar 1979 207 p
Avail: Univ. Microfilms Order No. 8003574

A technique was developed which allowed predictions of heat transfer to fluids in the supercritical region. This technique proved to be more general, less complicated, easier to use, and more accurate in comparison to the existing prediction schemes. The heat transfer predictions are in good agreement with the existing variable property experimental data. Analytical methods for predicting thermodynamic and transport properties in the supercritical region were developed from the available experimental data. A shorthand method (reference temperature) was developed by which heat transfer to fluids in the supercritical region under variable property conditions can be evaluated. The heat transfer results obtained with the reference temperature scheme showed good agreement with the existing variable property theoretical and experimental results. Dissert. Abstr.

N80-18331 California Univ., Davis.
HEAT TRANSFER TO AIR FROM A YAWED ISOTHERMAL CYLINDER Ph.D. Thesis
John Stanford Kraabel 1979 222 p
Avail: Univ. Microfilms Order No. 8003518

Local and mean heat transfer coefficients were determined experimentally at two subscritical Reynolds numbers for forced convective heat transfer from an isothermal circular cylinder to air. The stagnation point and laminar boundary layer heat transfer was found to be dependent only on the Reynolds number based on the velocity component normal to the cylinder. The local heat transfer from the rear of the cylinder, for moderate yaw (up to 40%), was also independent of the spanwise component of flow. At higher angles (50 deg, 60 deg), the heat transfer from the rear of the cylinder is dependent on both yaw and Reynolds number. The region of minimum heat transfer, which occurs in the vicinity of flow separation, was found to be dependent on the yaw. A numerical solution of the stagnation point and laminar boundary layer equations is presented. The numerical heat transfer results compare favorably with the experimental data. Dissert. Abstr.

N80-18332 Lehigh Univ., Bethlehem, Pa.
AN EXPERIMENTAL AND THEORETICAL STUDY OF THE CONFINED VORTEX WITH HIGH FLOW RATE Ph.D. Thesis
Walter Jeffrey Shakesphere 1979 156 p
Avail: Univ. Microfilms Order No. 8003070

The behavior of the flow field in the vortex chamber when the radial and tangential velocities are of equal order of magnitude at the cylindrical distributor and the Reynolds number based on chamber radius and radial velocity is of order 10,000 was investigated. A model was developed by piecing together the analyses for three regions, including the main part of the flow field, the portion near the end walls and the viscous core close to the axis of symmetry. It is shown that although the end wall secondary flow patterns persist, the end wall boundary layers may be uncoupled from the flow in the main region. An explanation for the variation in the size of the viscous core region with changes in operating parameters is presented and compared with a previous theory now used extensively in vortex modelling. A parametric analysis of the radial velocity profiles with changes in geometry was also done. Dissert. Abstr.

N80-18333 Princeton Univ., N. J.
MACROSCOPIC DESCRIPTION OF MULTI-PHASE SYSTEMS: A THERMODYNAMIC THEORY OF FLOW IN POROUS MEDIA Ph.D. Thesis
Majid Hassanizadeh 1980 289 p
Avail: Univ. Microfilms Order No. 8005288

A systematic averaging technique was developed and used to derive multi-phase equations of mass, momentum, angular momentum, energy and entropy from the balance laws for a single continuum. The technique was systematized by requiring a single set of criteria to govern the averaging of all quantities and all equations. Next, a constitutive theory for solid-fluid systems was developed. Finally, the general form of constitutive assumptions for porous media was reduced using the Coleman and Noll method of exploitation of entropy inequality. The constitutive equations were then linearized and a set of field equations were obtained which provided nine equations to be solved for fluid density, porosity, fluid velocity vector, solid displacement vector and the medium temperature. Certain fluid flow cases were reviewed and appropriate equations of varying degrees of approximation were obtained. Dissert. Abstr.

N80-18334 Cornell Univ., Ithaca, N. Y.
TURBULENCE MODELING IN HOMOGENEOUS FLOWS: DETERMINATION OF THE RAPID TERMS Ph.D. Thesis
Yasuo Bikane 1979 114 p
Avail: Univ. Microfilms Order No. 8003970

A method to determine the rapid terms in homogeneous turbulence was studied. The invariant functions in the dissipation equation were determined by data matching. The unknown invariant functions in the rapid terms were determined theoretically by using optimum variables and the independency hypothesis. In order to predict the existing data, one of the invariant functions was modified. The dissipation equation was also modelled by

the invariant technique. Because the form of the invariant functions in the equation is unknown, the form was assumed with two unknown constants which were optimized by data matching. The set of the modeling equations was tested for four experiments. The results agree reasonably with the experimental data. Dissert. Abstr.

N80-18335 Texas A&M Univ., College Station.
THE EFFECTS OF SPRAY ENTRAINMENT ON THE MEAN WIND PROFILE AND THE OVERALL LOAD ON MARINE STRUCTURES Ph.D. Thesis
John Michael Macha 1979 101 p
Avail: Univ. Microfilms Order No. 8003163

A model for the mean wind profile was developed. The log law for turbulent flow past a solid rough boundary was modified and applied to the relative wind speed over a wavy water surface. The waves were treated as individual roughness elements and the transfer of wind momentum to entrained spray drops was accounted for by an additional additive term. Experimental measurements in a high speed wind/wave channel showed that an equivalent 10-meter wind speed of 57 m/sec, the drag on entrained spray drops accounted for over 30 percent of the total momentum transfer from the wind. The spray content of the air at high wind speeds, was investigated from the standpoint of additional loading on marine structures due to spray impact. A maximum limiting spray concentration of .001 grams/cucm was determined based on the available turbulent mechanical energy in the wind shear layer. In addition, extensive measurements of spray concentration and impact force were conducted in the wind/wave channel. Dissert. Abstr.

N80-18336 Princeton Univ., N. J.
DEFORMATION AND HYDRODYNAMIC INTERACTION OF TWO PARTICLES IN A SUSPENSION Ph.D. Thesis
Mark Menachem Friedman 1979 167 p
Avail: Univ. Microfilms Order No. 8003782

The interactions between two particles immersed in a Newtonian fluid are studied under conditions such that inertial effects are negligible and no external forces or couples act on the particles. The flow field used is that produced by the Maxwell orthogonal rheometer. This flow field displays a nonzero vorticity and rate of deformation. Theories pertaining to the deformation of a single drop and the interaction of two solid spheres are combined and applied to the orthogonal rheometer flow field. Particle trajectories are obtained for two solid spheres, two fluid spheres, and two deformable drops in the linear, uniform shear flow field. Agreement between the theory and experiments performed in an orthogonal rheometer is obtained for only a few special cases. The lack of agreement is attributed to secondary flows induced by wall effects. These effects were shown to be produced by the bottom plate container wall and were related to the geometrical asymmetry of the orthogonal rheometer. Suggestions are offered as to how such problems may be overcome in the future. Dissert. Abstr.

EXPERIMENTAL STUDY OF THE STABILITY AND FLOW CHARACTERISTICS OF FLOATING LIQUID COLUMNS CONFINED BETWEEN ROTATING DISKS Final Report
A. A. Fowle, L. Soto, P. F. Strong, and C. A. Wang Feb. 1980 129 p
(Contract NASw-3186)
(NASA-CR-162800) Avail: NTIS HC A06/MF A01 CSCL 20D

A low Bond number simulation technique was used to establish the stability limits of cylindrical and conical floating liquid columns under conditions of isorotation, equal counter rotation, rotation of one end only, and parallel axis offset. The conditions for resonance in cylindrical liquid columns perturbed by axial, sinusoidal vibration of one end face are also reported. All tests were carried out under isothermal conditions with water and silicone fluids of various viscosities. A technique for the quantitative measurement of stream velocity within a floating, isothermal, liquid column confined between rotatable disks was developed. In the measurement, small, light scattering particles were used as streamline markers in common arrangement, but the capability of the measurement was extended by use of stereopair photography system to provide quantitative data. Results of velocity measurements made under a few selected conditions, which established the precision and accuracy of the technique, are given. The general qualitative features of the isothermal flow patterns under various conditions of end face rotation resulting from both still photography and motion pictures are presented. R.C.T.

AUTOMATIC THERMAL SWITCH Patent Application
Lawrence D. Wing and Joseph W. Cunningham, inventors (to NASA) Filed 30 May 1979 23 p
(NASA-Case-GSC-12415-1; US-Patent-Appl-SN-043943) Avail: NTIS HC A02/MF A01 CSCL 20D

An automatic heat flow control switch consisting of a thermal transfer plate pivotally mounted between two thermally conductive plates is described. A phase change power unit which includes a plunger is in contact with one of the conductive plates. When the unit is actuated by an increase in heat transmission, the plunger extends and pivots the transfer plate to vary the thermal conduction. An element connected to the transfer plate biases the transfer plate in a predetermined position with respect to the conductive plates. The biasing element, transfer plate, and piston can be arranged to provide either a closed or open thermally conductive path. The switch is to be used to control the temperature of electronic instruments in the Space Shuttle equipment bays. NASA

EXPERIMENTAL STUDY OF FLOW DUE TO AN ISOLATED SUCTION HOLE AND A PARTIALLY PLUGGED SUCTION SLOT Final Report, 1 Feb. 1978 - 31 Jan. 1980
G. L. Goglia and Stephen P. Wilkinson Feb. 1980 36 p refs
(Grant NsG-1491)
(NASA-CR-162808) Avail: NTIS HC A03/MF A01 CSCL 20D

Details for construction of a model of a partially plugged, laminar flow control, suction slot and an isolated hole are presented. The experimental wind tunnel facility and instrumentation is described. Preliminary boundary layer velocity profiles (without suction mode) are presented and shown to be in good agreement with the Blasius laminar profile. Recommendations for the completion of the study are made. An experimental program for study of transition on a rotating disk is described along with preliminary disturbance amplification rate data. RESONANT DOPPLER VELOCIMETER Ph.D. Thesis. Final Report, 1 Jul. 1974 - 31 Oct. 1979
Micha Zimmermann Mar. 1980 247 p refs
(Grant NsG-1070)
(NASA-CR-162815; MAE-T-1465) Avail: NTIS HC A11/MF A01 CSCL 20D

A technique is presented for visualizing and quantitatively

measuring velocity, temperature, and pressure by shining a single frequency laser beam into a gaseous flow which is seeded with an atomic species. The laser is tuned through the absorption frequencies of the seeded species and the absorption profile is detected by observing fluorescence as the atoms relax back to the ground state. The flow velocity is determined by observing the Doppler shift in the absorption frequency. Spectroscopic absorption line broadening mechanisms furnish information regarding the static temperature and pressure of the moving gas. Results of experiments conducted in the free stream and in the bow shock of a conical model mounted in a hypersonic wind tunnel indicate that the experimental uncertainties in the measurement of average values for the velocity, temperature and pressure of the flow are 0.1, 5 and 10 percent respectively. A SEMI-EMPIRICAL EQUATION FOR THE VISCOSITY OF AIR

James J. Gottlieb and David V. Ritzel Jul. 1979 23 p refs
(AD-A072053; DRES-TN-454) Avail: NTIS HC A02/MF A01 CSCL 20/4

Sutherland's theoretical expression for the absolute or dynamic viscosity of a gas has been modified to represent experimental viscosity data for air. The resulting semi-empirical equation accurately describes measured viscosities of air for temperatures ranging from the boiling point at 78 K to molecular dissociating conditions at 2500 K. Discrepancies between measured values and semi-empirical results rarely exceed 2%. Other more limited expressions for the viscosity of air are also compared to measured viscosity data and discussed. VISCOUS FLOWFIELDS INDUCED BY TWO- AND THREE-DIMENSIONAL LIFT JETS IN GROUND EFFECT Final Technical Report, 1 Feb. 1976 - 28 Feb. 1979

W. W. Bower, R. K. Agarwal, G. R. Peters, and D. R. Kotansky 1 Mar. 1979 38 p refs
(Contract N00014-76-C-0494; NR Proj. 215-246; RR0141184)
(AD-A078782; ONR-CR-215-246-3F) Avail: NTIS HC A03/MF A01 CSCL 20/4

An important consideration for VTOL aircraft design is the aerodynamic interaction between airframe undersurfaces and the ground. In an effort to predict this phenomenon, a second-order-accurate, finite-difference scheme for solution of the two- and three-dimensional conservation equations of fluid mechanics, in combination with a turbulence model, is described. The solution technique is applied to a planar lift jet in ground effect for both incompressible and compressible flow and to two interacting incompressible jets with fountain formation. Fluid properties that characterize the jet impingement flowfields are given for a range of Reynolds numbers, and comparisons with measured data are presented. GRA

STUDY OF THREE-DIMENSIONAL INTERNAL FLOW PROBLEMS RELATED TO TURBOMACHINERY FLOWS Annual Report, 1 Jan. - 31 Dec. 1978

Kirti N. Ghia and Urmila Ghia Feb. 1979 68 p refs
(Contract F49620-78-C-0041; AF Proj. 2307)
(AD-A078376; AFL-79-2-46; AFOSR-79-1264TR) Avail: NTIS HC A04/MF A01 CSCL 20/4

The primary objective of this two-year research project is to develop a finite-difference numerical technique for the solution of the parabolized Navier-Stokes equations using a system of surface-oriented coordinates suitable for ducts of arbitrary geometry. An additional objective to be fulfilled by this research consists of developing an analysis for laminar duct flow with stream wise separation using mathematical models simpler than the full Navier-Stokes equations. In order to achieve the above objectives, the following three problems have been studied during the first year of the two-year contract period: (1) Laminar Flow through Joukowski ducts, (2) Laminar flow through curved polar ducts, and (3) Analysis of laminar streamwise flow separation via a semi-elliptic mathematical model. In each phase of the research attention is given to the accuracy of the numerical solutions as well as the efficiency with which they can be determined. For this purpose, the following two additonal areas have been studied: (4) Higher accuracy of numerical solutions, and (5) Efficient numerical algorithms. Suitable model problems have been selected wherever required, in this research, with the overall goal of contributing to further the understanding of internal flows in turbomachinery. Each of the above research areas is described in this report. GRA

THEORETICAL STUDY OF THERMAL LOSSES: THE USE OF HYBRID AND COMBINED DRY COOLANTS [ETUDE DE BASE DES REJETS THERMIQUES: UTILISATION DE REFRIGERANTS SECS, HYBRIDES ET COMBINES]

Andre L. Jaumotte, Pierre Decock, Bernard Leduc, and Philippe Nagel 1978 67 p refs In FRENCH Sponsored by Groupement Ecologique Belge (GEBEG)
(NT-44-1978) Avail: NTIS HC A04/MF A01

After a brief review of techniques used in the disposal of waste heat from electrical power plants, dry coolant systems are cited as a promising solution. Emphasis is placed on the size reduction of cooling towers, on further limiting heat exchanger surfaces by using special cooling fin profiles, and on the introduction of an intermediary cold cycle between the condenser and the coolant (ammonia cycle). Results show that a combined wet tower/dry tower system has short term advantages, especially from a cost effectiveness point of view (reduced ecological impact). Three regions in Belgium are taken as examples of areas that might benefit from this scheme. As a long term solution the use of a condensable fluid (ammonia) with a cold cycle for recuperating thermal energy is suggested. Author (ESA)

THE INFLUENCE OF A HIGH PRESSURE GRADIENT ON UNSTEADY VELOCITY PERTURBATIONS IN THE CASE OF A TURBULENT SUPERSONIC FLOW [INFLUENCE D'UN

FORT GRADIENT DE PRESSION SUR DES PERTURBATIONS INSTATIONNAIRES DE VITESSE CAS D'UN ECOULEMENT TURBULENT SUPERSONIQUE]
J. J. Dussauge and J. F. Debieve Jul. 1979 28 p refs In FRENCH Presented at 15th Colloq. d'Aerodyn. Appl., Marseille, 7-9 Nov. 1978
(AAAF-NT-79-10; ISBN-2-7170-0537-4) Avail: NTIS HC A03/MF A01; CEDOCAR, Paris FF 17 (France and EEC) FF 21 (others)

The amplification or reduction of unsteady velocity perturbations under the influence of strong flow acceleration or deceleration is studied. Supersonic flows with large velocity and pressure gradients are examined and the conditions in which the velocity fluctuations depend on the action of the average gradients of pressure and velocity, rather than turbulence, are described. Experimental results obtained on a cylinder positioned parallel to the flow are analyzed statistically and interpreted as a 'return to laminar' process. It is shown that this 'return to laminar' implies negative values in the turbulence production terms for kinetic energy. A simple geometrical representation of the Reynolds stress production is given. It is also shown that in the experimental case the influence of viscous energy dissipation cannot be neglected. A TURBULENT LAYERS DESCRIPTION OF UNSTEADY TWO DIMENSIONAL FLOW [MODELISATION D'ECOULEMENTS BIDIMENSIONNELS INSTATIONNAIRES PAR DES NAPPES TOURBILLIONNAIRES]
C. Berger Paris Assoc. Aeron. et Astronautique de France 1979 32 p refs In FRENCH Presented at 15th Colloq. d'Aerodyn. Appl., Marseille, 7-9 Nov. 1978
(AAAF-NT-79-18; ISBN-2-7170-0545-5) Avail: NTIS HC A03/MF A01; CEDOCAR, Paris FF 29 (France and EEC) FF 33 (others)

The modeling of free layers is examined. It is shown that for computations based on point vortices, models do not adequately describe continuous media flow. Taking into account the continuity of the layer by means of fluid segments allows the elimination of those irregularities and makes it possible to calculate its deformation to a very advanced degree. Examples of Kelvin-Helmholtz instability are presented and compared with the linear theory. This model is then applied to an alternative vortices regime in a flow around a cylinder. The evolution of the pressure distribution on the cylinder is represented adequately by this model. Author (ESA)

PERTURBATION SOLUTIONS FOR BLAST WAVES IN A LOW DENSITY GAS
S. Srinivasan Aug. 1978 46 p refs
(VTH-LR-263) Avail: NTIS HC A03/MF A01

A solution for the propagation of blast waves in a low density gas, in which a virial power expansion in terms of the parameter lambda representing the product of the internal volume of the molecules which is assumed to be constant and the initial gas density is used in the equation of state, is presented. Analytical expressions are obtained by means of a perturbation technique showing the dependence of pressure, density, and gas velocity on the distance from the origin of the explosion and the distance of the shock front. The influence of the parameter lambda on the flow field and temperature distributions is studied at different stages of the explosion process. Shock velocity variations with the shock propagation distance and shock trajectories are also determined. A comparison is made with ideal gas solutions. It is found in a significant temperature drop near the origin. Author (ESA)

NON-UNIFORM PROPAGATION OF CYLINDRICAL SHOCKS AND DETONATIONS
S. Srinivasan Aug. 1978 39 p refs
(VTH-LR-264) Avail: NTIS HC A03/MF A01

Nonuniform propagation of diverging cylindrical shocks and detonations are considered. The nonsimilar effects due to counter pressure are accounted for in the case of shocks. For overdriven detonations, the nonsimilar effect due to heat release at the wave front is taken into account. Detailed flow patterns and characteristic properties are presented for these two situations. Author (ESA)

N80-18356# Research Inst. of National Defence, Stockholm (Sweden).
MODEL FOR THE FRONT PROPAGATION IN A DETONATING GAS
Sven Wahlborn and Hjoerdis Celander Sep. 1978 30 p refs
(FOA-C-20323-D6(D8)) Avail: NTIS HC A03/MF A01

The general laws for the propagation of an explosion wave in a perfect gas are presented and reformulated in a pair of characteristic equations. The solutions of these equations are discussed for nonsteady detonation processes where the front speed (U) is allowed to vary in a regular fashion with front

location (R). In a simplified model, governed essentially by the Hugoniot conditions and overall energy conservation, an explicit relation between U and R is derived for a strong detonation (spherical case). This model is applied to unconfined divergent detonation and to laser driven detonation. Conclusions are drawn about the qualitative validity of the model and the initiation criteria for the processes considered. Author (ESA)

(NASA-Case-NPO-14501-1; US-Patent-4,185,493; US-Patent-Appl-SN-918535; US-Patent-Class-73-56; US-Patent-Class-73-343R; US-Patent-Class-264-40.4) Avail: US Patent and Trademark Office CSCL 14B

A method and apparatus are provided for enabling the measurement of the viscosity of substances, especially those containing volatiles at elevated temperatures, with greater accuracy and at less cost than before. The apparatus includes a cylinder with a narrow exit opening at one end and a piston which closely slides within the cylinder to apply force against a sample in the cylinder to force the sample through the exit opening. In order to more rapidly heat a sample the ends of the cylinder and piston are tapered and the sample is correspondingly tapered, to provide a large surface to volume ratio. A corresponding coal sample is formed by compressing particles of coal under high pressure in a mold of appropriate shape.

DECONVOLUTION OF GAS CHROMATOGRAPHIC DATA Final Report
Samuel Howard and Grayson H. Rayborn Feb. 1980 79 p refs
(Contract NsG-1380)
(NASA-CR-3229) Avail: NTIS HC A05/MF A01 CSCL 07D

The use of deconvolution methods on gas chromatographic data to obtain an accurate determination of the relative amounts of each material present by mathematically separating the merged peaks is discussed. Data were obtained on a gas chromatograph with a flame ionization detector. Chromatograms of five xylenes with differing degrees of separation were generated by varying the column temperature at selected rates. The merged peaks were then successfully separated by deconvolution. The concept of function continuation in the frequency domain was introduced in striving to reach the theoretical limit of accuracy, but proved to be only partially successful. R.C.T.

INFRARED SCANNER CONCEPT VERIFICATION TEST REPORT
F. D. Bachtel Jan. 1980 66 p
(NASA-TM-78264) Avail: NTIS HC A04/MF A01 CSCL 14B

The test results from a concept verification test conducted to assess the use of an infrared scanner as a remote temperature sensing device for the space shuttle program are presented. The temperature and geometric resolution limits, atmospheric attenuation effects including conditions with fog and rain, and the problem of surface emissivity variations are included. It is concluded that the basic concept of using an infrared scanner to determine near freezing surface temperatures is feasible. The major problem identified is concerned with infrared reflections which result in significant errors if not controlled. Action taken to manage these errors result in design and operational constraints to control the viewing angle and surface emissivity. R.C.T.

FIBER OPTIC SENSORS FOR MEASURING ANGULAR POSITION AND ROTATIONAL SPEED
Robert J. Baumbick Mar. 1980 13 p
(NASA-TM-81454; E-381) Avail: NTIS HC A02/MF A01 CSCL 20F

Two optical sensors, a 360 deg rotary encoder and a tachometer, were built for operation with the light source and detectors located remotely from the sensors. The source and detectors were coupled to the passive sensing heads through 3.65 meter fiber optic cables. The rotary encoder and tachometer were subjected to limited environmental testing. They were installed on an air breathing engine during recent altitude tests. Over 100 hours of engine operation were accumulated without any failure of either device. K.L.

SPECIFICATION FOR THE INSTALLATION OF ELECTRICAL RESISTANCE STRAIN GAUGES ON STRAIN PAIRS COUNTER AIRCRAFT
S. W. Gee Mar. 1979 13 p
(AD-A071363; ARL/Struc-TM-301) Avail: NTIS HC A02/MF A01 CSCL 14/2

A number of RAAF aircraft are to be strain gauged as part of a program designed to monitor the in-flight fatigue damage accumulated by service aircraft during normal squadron usage. Flight strains are to be measured by gauges, strategically placed on the structure and monitored by strain pairs counters. The materials and methods of application recommended in this memo, have been successfully used for flight trials over several years and have proved very reliable. Any deviations from the suggested methods should be thoroughly checked before use on the aircraft. GRA

GIMBAL PICKOFF TECHNOLOGICAL STUDIES
Aubrey Rodgers Aug. 1979 22 p refs
(AD-A076372; DRSMI-T-79-81) Avail: NTIS HC A02/MF A01 CSCL 17/7

The purpose of this study and analysis is to employ more sophisticated gyro gimbal pickoff component technology to replace existing pickoff designs. The existing wide gyro pickoffs experience gimbal wiring and slipring torques, potentiometer wiper lift off during flight environment, noise, increased friction, and assembly cost. The goals of this study are to gain a better understanding of the pickoff error mechanism and to utilize the major advances in component development, materials, and manufacturing techniques as applicability to the design of inertial instruments. DIELECTRIC-LOADED WAVEGUIDE CIRCULATOR FOR CRYOGENICALLY COOLED AND CASCADED MASER WAVEGUIDE STRUCTURES Patent
Robert C. Clauss (JPL) and Rex B. Quinn, inventors (to NASA) (JPL) Issued 5 Feb. 1980 6 p Filed 9 Feb. 1978 Supersedes N78-22359 (16 - 13, p 1703) Sponsored by NASA
(NASA-Case-NPO-14254-1; US-Patent-4,187,470;
US-Patent-Appl-SN-876432; US-Patent-Class-330-4;
US-Patent-Class-331-94; US-Patent-Class-333-24R) Avail: US Patent and Trademark Office CSCL 20E

A dielectrically loaded four port waveguide circulator is used with a reflected wave maser connected to a second port between first and third ports to form one of a plurality of cascaded maser waveguide structures. The fourth port is connected to a waveguide loaded with microwave energy absorbing material. The third (output signal) port of one maser waveguide structure is connected by a waveguide loaded with dielectric material to the first (input) port of an adjacent maser waveguide structure, and the second port is connected to a reflected wave maser by a matching transformer which passes the signal to be amplified into and out of the reflected wavemaser and blocks pumping energy in the reflected wave maser from entering the circulator. A number of cascaded maser waveguide structures are thus housed in a relatively small volume of conductive material placed within a cryogenically cooled magnet assembly.

NECESSARY CONDITIONS FOR THE HOMOGENEOUS FORMATION OF A VOLUME AVALANCHE DISCHARGE WITH SPECIFIC APPLICATIONS TO RARE GAS-HALIDE EXCIMER LASER DISCHARGES Ph.D. Thesis
Jeffrey Ian Levatter 1979 153 p
Avail: Univ. Microfilms Order No. 8002939

The phenomena involved in high E/n (electric field to gas number density ratio) breakdown and its relationship to the formation of spatially homogeneous discharges is considered. Assuming uniform field electrodes with no edge effects, the minimum preionization density required for homogeneous discharge initiation is found to depend on the voltage rise time across the electrodes as well as on the total gas pressure and various electrochemical properties of the gas mixture. A large volume avalanche dicharge laser was constructed which employs an 1 X-ray preionization scheme to obtain the required spatially uniform volume preionization. Using X-rays as an ionizing agent, spatially homogeneous pulsed avalanche discharges of several liter volume at several atmosphere pressure for up to 100-nesec duration were successfully generated. In concurrent laser generation experiments, high-optical-quality pulsed UV laser output up to 2.5 J/liter from such discharges in rare gas/halogen mixtures, and ir laser output of up to 12.5 J/liter from a He/N2/CO2 mixture were observed. Dissert. Abstr.

EXCITED STATES OF RUBIDIUM POPULATED BY STEP-WISE EXCITATION USING A RUBIDIUM LAMP AND/OR A TUNABLE DYE LASER: IMPORTANCE OF REDISTRIBUTION COLLISIONS Ph.D. Thesis
Ralph Henry Hill, Jr. 1979 133 p
Avail: Univ. Microfilms Order No. 8003147

Excited states of rubidium were populated by using a stepwise excitation scheme. The first step is either a transition to an atomic intermediate state using a rubidium resonance lamp, or a transition to a molecular intermediate state using a laser as the excitation source. The second step in both cases is accomplished using a laser to populate high states in the rubidium atom. Two different commercial lasers were used and the results were compared. One laser is a single mode laser whereas the other is a multimode laser. Once the excited states are populated, the importance of collisions with ground state rubidium atoms is investigated. Angular momentum changing collision cross sections are investigated. Dissert. Abstr.

N80-18375 Illinois Univ. at Urbana-Champaign.
LASER MELTING AND SUBSEQUENT SOLIDIFICATION OF A SURFACE LAYER Ph.D. Thesis
Shin-Chen Hsu 1979 224 p
Avail: Univ. Microfilms Order No. 8004193

The effect of stationary and moving high intensity heat fluxes, achieved by laser or electron beam radiation, on the surface melting and subsequent solidification variables of metallic substrates was investigated. The problems considered are the rapid melting and solidification of the surface layer of a semi-infinite solid subjected to: (1) step function stationary uniform heat flux over a circular region on its bounding surface when heat flow conditions are almost unidirectional; (2) step function stationary uniform and Gaussian heat flux distributions over a circular region on its bounding surface when heat flow is two-dimensional; and (3) uniform and Gaussian heat flux distributions over a circular region on its bounding surface moving

with a constant velocity, U, in the y-direction. Microstructural observations made on an Al-4.5% Cu alloy substrate are described and the findings are compared with the general trends established in the quasisteady state moving flux calculations. Dissert. Abstr.

N80-18376 State Univ. of New York at Stony Brook.
STUDIES IN ONE BEAM LASER SPECKLE INTERFEROMETRY Ph.D. Thesis
Gopal Krishan Jaisingh 1979 215 p
Avail: Univ. Microfilms Order No. 8004408

Topics covered include: (1) the motion of subjective speckles; (2) the upper bound of the one beam method; (3) the effects of an axial movement of the filtering aperture from its usual Fourier plane position on the wholefield filtering method; (4) a technique to determine surface contours of three dimensional objects; (5) a method to determine in-plane and out of plane displacement of a surface simultaneously by combining the one beam speckle method with projection moire; (6) determining displacements at the interior of three dimensional transparent objects using speckles produced by the scattered laser light; (7) fringe sharpening and (8) extension of the two beam method to three beams. Dissert. Abstr.

N80-18377 Illinois Univ. at Urbana-Champaign.
MULTIPHOTON CONTRIBUTIONS TO FAR INFRARED GENERATION IN OPTICALLY PUMPED DEUTERIUM OXIDE Ph.D. Thesis
Samuel Judah Petuchowski 1979 172 p
Avail: Univ. Microfilms Order No. 8004253

Far infrared (FIR) emission at 66 and 50 microns in D2O vapor, optically pumped with a CO2 TEA laser, is shown to constitute a stimulated Raman process associated with each wave within a system of four molecular vibrational-rotational levels. A propagation model, based on a semiclassical, quasistatic density matrix analysis, is constructed and applied to the system. The model is generalized to include one-, two-, and three-wave interactions among three near-resonant waves of arbitrary intensity in a variety of four-level system configurations. Agreement between the model calculations and empirical data is shown with respect both to FIR temporal behavior and to 66 micron pulse energy vs. D2O pressure and pump intensity. Explicit account is taken of inhomogeneous broadening of the pump transition at lower D2O pressures. Various hypotheses are considered to explain the singular failure of the model to account for the observed 50 micron intensity. Dissert. Abstr.

A 30-kW CO2 MIXING LASER
Ross C. McLeary, Russell E. Whitcher, and Peter J. Beckwith Jun. 1979 22 p refs
(MRL-R-751; AR-001-830) Avail: NTIS HC A03/MF A01

A convectively cooled, continuous wave mixing laser is described which is simple, robust, and reliable, and can be manufactured in a workshop with standard machining facilities. High pressure discharges are stabilized by pre-ionizing the gas flow by passing it through an array of subsidiary arc discharges. Flowing nitrogen, at a pressure of 120 kPa is electrically excited before passing through a restriction into a region of high pressure (20 kPa), where it is mixed with CO2. A small quantity of helium is added to depopulate the lower laser level and the optical power is extracted by means of a resonator situated downstream of the mixing system. The laser is operated in a blow down mode in which the gases are initially stored in pressure vessels and subsequently flow through the laser into a vacuum task. The plasma injection technique produced a laser with an output power of 30 kW at an efficiency rate of 9 percent. A.R.H.

LASER MEASURING SYSTEM FOR INCREMENTAL ASSEMBLIES Patent Application
James A. Munford and John G. Etzel, inventors (to NASA) Filed 7 Dec. 1979 14 p
(NASA-Case-GSC-12321-1; US-Patent-Appl-SN-102001) Avail: NTIS HC A02/MF A01 CSCL 20E

Incremental assemblies such as wire-wrapped frame assemblies used in spark chambers and the like are precisely measured using a system which includes a laser, an interferometer, and a retroreflector. A light source and a photodetector are located adjacent to the incremental assembly and mounted on a movable carriage. The interferometer is also mounted on the movable carriage, while the laser and retroreflector are positioned at either end of the carriage track. The carriage is moved along one edge of the incremental assembly between the retroreflector and the laser, and as the carriage is moved, the light from the light source to the photodetector is interrupted. This produces a trigger command to a control unit which in turn causes a distance measurement to be made. A printout is provided for each sampling trigger command to list such items as ideal position, actual position and amount of error. NASA

HIGH POWER METALLIC HALIDE LASER Patent Application
Thomas J. Pivirotto, inventor (to NASA) (JPL) Filed 7 Feb. 1980 19 p
(Contract NAS7-100)
(NASA-Case-NPO-14782-1; US-Patent-Appl-SN-119339) Avail: NTIS HC A02/MF A01 CSCL 20E

A high power metallic halide (CU3C13) laser capable of providing 300 watts of output power is disclosed. More specifically it is a laser amplification system and a heat exchanger in a closed loop system. In addition, a molecular dissociation apparatus is provided at the input to the laser amplifier for dissociating the copper chloride into copper atoms and ions and chlorine atoms and ions. The dissociation apparatus includes a hollow cathode tube and an annular ring spaced apart from the tube end. A voltage differential is applied between the annular ring and the hollow cathode tube so that as the copper chloride flows therethrough, it is dissociated into copper and chlorine ions and atoms. NASA

APPLICATION OF TUNABLE DIODE LASERS AS LOCAL OSCILLATORS IN AN INFRARED HETERODYNE RADIOMETER (IHR) Final Report
M. G. Savage, R. C. Augeri, and B. J. Peyton Dec. 1979 95 p refs
(Contract NAS1-14362)
(NASA-CR-159121) Avail: NTIS HC A05/MF A01 CSCL 20E

The utility of diode lasers as local oscillators (LOs) in a heterodyne receiver application was investigated. The CW power, spectral tunability, spectral stability, and spatial intensity distribution of the TDL outputs were measured. A tunable diode laser LO was incorporated into a laboratory Dicke-switched infrared heterodyne setup and used to measure radiometer sensitivity as well as spectroscopic characteristics of selected absorption lines of ammonia. The test results on one of the two tunable diode lasers are emphasized in an attempt to provide a comprehensive data package which may be useful for future planning purposes. The second tunable diode laser exhibits characteristics similar to the fully tested TDL with the exception that some changes in its performance characteristics as it was temperature cycled between room temperature and the operating temperature of approximately 50K occurred. A.R.H.

THE NON-LINEAR THEORY OF FREE ELECTRON LASERS AND EFFICIENCY ENHANCEMENT
P. Sprangle, Cha-Mfi Tang, and W. M. Manheimer Washington, D.C. Wave Research Lab. 28 Sep. 1979 54 p refs
(DARPA Order 3817; RR011941)
(AD-A075063; NRL-MR-4034) Avail: NTIS HC A04/MF A01 CSCL 20/5

The development of lasers in which the active medium is a relativistic stream of free electrons has recently evoked much interest. The potential advantages of such free electron lasers include, among other things, continuous frequency tunability, very high power of operations and high efficiency. The free electron laser is characterized by a pump field: for example, a spatially periodic magnetic field, which scatters from a relativistic electron beam. The scattered radiation has a wavelength much smaller than the pump wavelength depending on the electron beam energy. We present a general self-consistent non-linear theory of the free electron laser process. The non-linear formulation of the temporal steady state free electron laser problem results in a set of coupled differential equations governing the spatial evolution of the amplitudes and wavelength of the radiation and space charge fields. These equations are readily solved numerically since the amplitude and wavelength vary on a spatial scale which is comparable to a growth length of the output radiation. A number of numerical/analytical illustrations are presented ranging from the optical to the submillimeter wavelength regime. Our non-linear formulation in the linear regime is compared with linear theory and agreement is found to be excellent. Analytical expressions for the saturated efficiency and radiation amplitude are also shown to be in very good agreement without non-linear numerical solutions. Efficiency curves are obtained for both the optical and submillimeter FEL examples with fixed magnetic pump parameters. We show that these intrinsic efficiencies can be greatly enhanced by appropriately contouring the magnetic pump period. GRA

PERFORMANCE AND DIAGNOSTICS OF LASERS INITIATED BY THE REACTION OF NO WITH ClO2
S. J. Arnold, K. D. Foster, and D. R. Snelling Sep. 1979 25 p refs
(AD-A076010; DREV-R-4144/79) Avail: NTIS HC A02/MF A01 CSCL 20/5

A purely chemical HCl laser employing transverse flow was operated with a maximum multiline output power of 13 W, which represents a chemical efficiency of 8.6% based on the total exothermicity of the pumping reaction. The required nonequilibrium concentration on Cl atoms was generated by the branched-chain reaction of NO with ClO2. Mass spectrometric and absorption spectroscopic measurements of species concentrations in the NO/ClO2 reaction system showed that the effectiveness of production of the branched chain decreased with increasing total pressure. METHODS OF EFFICIENCY ENHANCEMENT AND SCALING FOR THE GYROTRON OSCILLATOR Interim Report
K. R. Chu, M. E. Read, and A. K. Ganguly Sep. 1979 29 p refs
(Contract DE-AC01-79ET-52053)
(AD-A075133; NRL-MR-4051) Avail: NTIS HC A03/MF A01 CSCL 20/5

It is shown that a gyrotron oscillator operating in a slightly tapered magnetic field can attain an efficiency of about 78%, approximately 1.7 times higher than that obtainable in a constant magnetic field. Extensive numerical data have been tabulated and a convenient parameter is introduced to generate numerical efficiency scaling relations through which optimum operating conditions are clearly exhibited. Conditions for reaching the high efficiency operating regime have also been studied and are numerically illustrated. GRA

FLAMEOUT AND ACOUSTIC DAMPING IN PULSED CHEMICAL LASERS Final Report
R. Limpaecher Jun. 1979 143 p refs
(Contract N00173-76-C-0162; DARPA Order 3016)
(AD-A076124) Avail: NTIS HC A07/MF A01 CSCL 20/5

The objective of this program was to address the acoustic damping issue of a repetitively-pulsed atmospheric pressure pulsed chemical laser. For this purpose a device, one meter in size parallel to the optical axis, was designed and constructed. To achieve flameout 80 fluidic devices were used to control the hydrogen flow. A new mixer was fabricated to obtain the required medium quality using a photochemical machining technique. For the acoustic quieting a heat exchanger was used to reduce the acoustic reflection of the hot-cold gas interfaces, and a muffler type acoustic absorber was constructed for acoustic energy attenuation. The results of a limited test period have been described. GRA

THEORETICAL STUDIES OF LASER LIGHT INTERACTION AND OPTICAL AND X-RAY EMISSION FROM DENSE METALLIC PLASMAS Final Report, 1 Aug. 1975 - 1 Oct. 1979
J. J. Duderstadt and R. S. B. Ong Nov. 1979 55 p refs
(Grant AF-AFOSR-2904-76; AF Proj. 2301)
(AD-A078664; AFOSR-79-1303TR) Avail: NTIS HC A04/MF A01

The interaction of a high power CO2 laser with a dense plasma is investigated. Stimulated Brillouin scattering and thermal self-focusing of the incident beam is studied. The dynamics of a strongly turbulent plasma generated by laser-plasma interaction, and the behavior of nonlinear waves (solitons) in the plasma is analyzed. Advanced MHD plasma simulation models are employed to study the complex dynamics of nonequilibrium plasmas interacting with laser radiation. MHD computer codes capable of simulating exploding wire or pinch dynamics subjected to intense laser irradiation are developed. Radiation transport effects, such as X-ray line emission and re-absorption in optically thick regions of the plasma, are incorporated in the MHD computer code. GRA

DESIGN OF INJECTION LASERS FOR IMPROVED RADIATION PERFORMANCE Final Report, 23 Feb. 1976 - 22 Feb. 1979
Jerome K. Butler 14 Nov. 1979 111 p refs
(Grant DAAG29-76-G-0146; DA Proj. 1T1-61102-BH-57)
(AD-A078519; ARO-13568.9-EL) Avail: NTIS HC A06/MF A01 CSCL 20/9

This research was concerned with (1) the electromagnetic modes and (2) the radiation pattern characteristics of contemporary injection laser structures. The objective was to investigate laser structures which can produce stable-beam radiation patterns. The control of lateral fields in lasers has been accomplished with many novel devices such as the channeled-substrate-planar, buried heterostructure and strip-loaded waveguide. The drawback to the stripe laser is that it is laterally unstable. Much of our work has been aimed at rigorously modeling the electromagnetic modes of stripe lasers. We have also applied our analysis to other lasers such as the channeled-substrate-planar device. GRA

THE THEORY OF OPTICAL RESONATORS
L. Ronchi (CNR, Florence) Jun. 1979 24 p refs Transl. into ENGLISH from Alta Frequenza (Italy), v. 47, no. 6, 1978 p 468-474
(DRIC-Trans-5616; BR68834) Avail: NTIS HC A02/MF A01

The operating principles of optical resonators are examined, focusing on unstable resonators used in the field of high power lasers. The main characteristic discussed is that every mode occupies the whole volume at its disposal and in particular, the volume of the active material. This is related to the control of lateral modes. Theory predicts that the connection with external space can be exploited by using the radiation spillover which generally corresponds with a fairly regular near field. It is noted that reported experimental results on unstable resonators agree well with the presented theoretical analysis regarding field distributions and connection with outside space. Author (ESA)

37 MECHANICAL ENGINEERING

Includes auxiliary systems (non-power); machine elements and processes; and mechanical equipment.

CRYOGENIC CONTAINER COMPOUND SUSPENSION STRAP Patent
John W. Vorreiter, inventor (to NASA) Issued 22 Jan. 1980 5 p Filed 22 Aug. 1978 Supersedes N79-18087 (17 - 09, p 1109)
(NASA-Case-ARC-11157-1; US-Patent-4,184,609; US-Patent-Appl-SN-935827; US-Patent-Class-220-445; US-Patent-Class-220-423; US-Patent-Class-220-901) Avail: US Patent and Trademark Office CSCL 13I

A support strap for use in a cryogenic storage vessel for supporting the inner shell from the outer shell with a minimum heat leak is presented. The compound suspension strap is made from a unidirectional fiberglass epoxy composite material with an ultimate tensile strength and fatigue strength which are approximately doubled when the material is cooled to a cryogenic temperature.

COMBUSTION SIMULATION OF A DUAL CHAMBER STRATIFIED CHARGE SPARK IGNITION ENGINE Ph.D. Thesis
Samuel Shangchi Pan 1979 210 p
Avail: Univ. Microfilms Order No. 8004247

A one-dimensional mathematical model was developed which includes the submodels of ignition, mixing; chemical kinetics, heat transfer, turbulent diffusivity, and NO formation. Studies are made on the basic parameters, such as the turbulence level, the preexponential constant, the heat transfer, the mixing percentage, the total air fuel ratio, the prechamber intake air fuel ratio, the prechamber intake mass flow ratio, the volumetric efficiency, the throat diameter, and the spark location and timing. The calculated results correlate well with the experimental data. All the predicted trends agree with the experimental trends over the range of the engine conditions investigated. Dissert. Abstr.

N80-18395 Tennessee Technological Univ., Cookeville.
IDENTIFICATION OF NOISE SOURCES IN FC CENTRIFUGAL FAN ROTORS Ph.D. Thesis
David Raj 1978 263 p
Avail: Univ. Microfilms Order No. 8004108

The sources of broad band noise in forward curved centrifugal fan rotors were studied using a 10.6 inch diameter fan. The flow field inside the fan was observed using flow visualization techniques. The velocity and velocity fluctuations of the rotor exit flows were measured using a hot-wire anemometer. The blade-to-blade variation of the absolute velocity, both magnitude and direction, and the high level of velocity fluctuations made it necessary to develop a special sampling system for the velocity measurements. This system was successfully used to measure the rotor exit velocity levels. The separated flow over the blade suction surface was the major broad band noise source. The presence of circumferential and axial gradients in the mean flow also contributed to the problem. The rotor blades must be redesigned to eliminate the flow separation over the suction surfaces. Dissert. Abstr.

FLARED TUBE ATTACH SYSTEM Patent Application
Innis D. Alkire (Rockwell International Corp., Houston, Tex.) and Julian P. King, Jr., inventors (to NASA) (Rockwell International, Houston, Tex.) Filed 18 Jan. 1980 16 p Sponsored by NASA
(NASA-Case-MSC-18416-1; US-Patent-Appl-SN-113017) Avail: NTIS HC A02/MF A01 CSCL 13I

A flared tube connection is described. It can be disassembled and assembled in a nondestructive manner without wasting, discarding, or damaging any of its parts or any portion of the associated tubing and parts to which it is joined, and features a split ferrule which may be installed or removed in situ and used to couple fluid lines without the necessity of a permanently installed coupling nut. NASA

INTERNAL COMBUSTION ENGINE WITH ELECTROSTATIC DISCHARGING FUELS Patent Application
James B. Stephens (JPL) and Charles G. Miller, inventors (to NASA) (JPL) Filed 18 Sep. 1979 16 p Sponsored by NASA
(NASA-Case-NPO-13798-2; US-Patent-Appl-SN-076635) Avail: NTIS HC A02/MF A01 CSCL 21A

An internal combustion engine system is disclosed in which a mixture of air and fuel droplets which are electrostatically charged to a selected polarity, e.g., negative, is fed to the engine's chambers. The fuel droplets are of uniform size in the micron range, and tend to be uniformly distributed in each chamber. Each chamber includes an electrode which, at a particular point in the engine's cycle of operation, is electrically connected to a

potential of a polarity opposite the polarity of the fuel droplets' charge to initiate electrostatic discharging of the droplets. The discharging produces sparks which initiate the combustion of the fuel droplets. Due to electrically insulating matter in the chambers' walls the charged droplets prior to combustion are repelled away from the walls to minimize combustion quenching. NASA

N80-18398*# National Aeronautics and Space Administration. Lyndon B. Johnson Space Center, Houston, Tex.
THERMAL BARRIER SEAL Patent Application
Milo Surbat (Rockwell International Corp., Downey, Calif.) and John O. Kane, inventors (to NASA) (Rockwell International Corp., Downey, Calif.) Filed 10 Mar. 1980 16 p Sponsored by NASA
(NASA-Case-MSC-18390-1; US-Patent-Appl-SN-092170) Avail: NTIS HC A02/MF A01 CSCL 11A

A thermal barrier for providing thermal sealing in an elongated space of varying width between adjacent surfaces of first and second members mounted for at least limited movement relative to each other is disclosed. The barrier may include an elongated envelope formed by an elongated sheet of fibrous material centrally and longitudinally folded to provide trailing and leading edges of the barrier. An elongated rigid support plate, the contour of which conforms to the contour of the adjacent surface of one of the members, may be enclosed in the envelope. An elongated core may be confined within the envelope near its leading edge between the rigid support plate and the inner surface of the other side of the envelope. The core is deformable to accommodate the varying width of the elongated space while still maintaining thermal sealing contact between the barrier and the adjacent surfaces of the first and second members. MOVING BODY VELOCITY ARRESTING LINE Patent Application
Reid A. Hull, inventor (to NASA) Filed 28 Dec. 1979 11 p
(NASA-Case-LAR-12372-1; US-Patent-Appl-SN-108107) Avail: NTIS HC A02/MF A01 CSCL 13H

A method for arresting a moving body using steel cables that elongate to absorb kinetic energy is presented. A sleeve surrounding the cables protects them from chafing and provides an energy absorbing system should the cables fail. NASA

N80-18400*# National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.
GAS PATH SEAL Patent Application
Robert C. Bill and Robert D. Johnson, inventors (to NASA) Filed 20 Nov. 1979 8 p
(NASA-Case-NPO-12131-3; US-Patent-Appl-SN-096255) Avail: NTIS HC A02/MF A01 CSCL 20A

A gas path seal suitable for use with a turbine engine or compressor is described. A shroud wearable or abradable by the abrasion of the rotor blades of the turbine or compressor shrouds the rotor bades. A compliant backing surrounds the shroud. The backing is a yieldingly deformable porous material covered with a thin ductile layer. A mounting fixture surrounds the backing. NASA

N80-18401*# National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.
CIRCUMFERENTIAL SHAFT SEAL Patent Application
L. P. Ludwig, inventor (to NASA) Filed 7 Dec. 1979 8 p
(NASA-Case-LEW-12119-2; US-Patent-Appl-SN-102004) Avail: NTIS HC A02/MF A01 CSCL 20A

A circumferential shaft seal in which the seal elements are capable of adequate response to shaft motion is described. The seal is comprised of two sealing rings held to a rotating shaft by means of a surrounding elastomeric band. The rings are segmented and have an inner diameter dimensioned so that the segments can slidably and sealably engage the shaft. Alternative embodiments of the seal concept are described and suggestions for component materials are given. M.G.

N80-18402*# National Aeronautics and Space Administration. Langley Research Center, Langley Station, Va.
IMPROVED TIRE/WHEEL CONCEPT Patent Application
Philip M. Harper, Sr., inventor (to NASA) (Boeing Commercial Airplane Co., Seattle, Wash.) Filed 12 Dec. 1979 12 p Sponsored by NASA
(NASA-Case-LAR-11695-2; US-Patent-Appl-SN-103836) Avail: NTIS HC A02/MF A01 CSCL 01C

A tire and wheel assembly is described which consists of a low profile pneumatic tire with sidewalls that deflect inwardly under a load and a wheel having a narrow central channel and extended rim flanges. The extended rim flanges support the tire sidewalls under static and dynamic loading conditions to produce a combination particularly suited to aircraft applications. NASA

ANALYTICAL AND EXPERIMENTAL SPUR GEAR TOOTH TEMPERATURE AS AFFECTED BY OPERATING VARIABLES
Dennis P. Townsend and Lee S. Akin (Western Gear Corp., Industry, Calif.) 1980 29 p refs Presented at 3d Intern. Power Transmission and Gearing Conf., San Francisco, Calif., 18-22 Aug. 1980; sponsored by Am. Soc. of Mech. Engr.
(NASA-TM-81419; E-342) Avail: NTIS HC A03/MF A01 CSCL 13I

A gear tooth temperature analysis was performed using a finite element method combined with a calculated heat input, calculated oil jet impingement depth, and estimated heat transfer coefficients. Experimental measurements of gear tooth average surface temperatures and instanteous surface temperatures were made with a fast response infrared radiometric microscope. Increased oil jet pressure had a significant effect on both average and peak surface temperatures at both high load and speeds. Increasing the speed at constant load and increasing the load at constant speed causes a significant rise in average and peak surface temperatures of gear teeth. The oil jet pressure required for adequate cooling at high speed and load conditions must be high enough to get full depth penetration of the teeth. Calculated and experimental results were in good agreement with high oil jet penetration but showed poor agreement with low oil jet penetration depth. Author

EVALUATION OF A HIGH PERFORMANCE FIXED-RATIO TRACTION DRIVE
Stuart H. Loewenthal, Neil E. Anderson, and Douglas A. Rohn 1980 32 p refs Proposed for presentation at 3d Intern. Power Transmission and Gearing Conf., San Francisco, Calif., 18-22 Aug. 1980; sponsored by Am. Soc. of Mech. Engr.
(NASA-TM-81425; E-349) Avail: NTIS HC A03/MF A01 CSCL 13I

The results of a test program to evaluate a compact, high performance, fixed ratio traction drive are presented. This transmission, the Nasvytis Multiroller Traction Drive, is a fixed ratio, single stage planetary with two rows of stepped planet rollers. Two versions of the drive were parametrically tested back-to-back at speeds to 73,000 rpm and power levels to 180 kW (240 hp). Parametric tests were also conducted with the Nasvytis drive retrofitted to an automotive gas turbine engine. The drives exhibited good performance, with a nominal peak efficiency of 94 to 96 percent and a maximum speed loss due to creep of approximately 3.5 percent. Author

N80-18405*# National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.
ENDURANCE AND FAILURE CHARACTERISTICS OF MODIFIED VASCO X-2, CBS 600 AND AISI 9310 SPUR GEARS
Dennis P. Townsend and E. V. Zaretsky 1980 28 p refs Proposed for presentation at 3d Intern. Power Transmission and Gearing Conf., San Francisco, Calif., 18-22 Aug. 1980; sponsored by Am. Soc. of Mech. Engr.
(NASA-TM-81421; E-344) Avail: NTIS HC A03/MF A01 CSCL 13I

Gear endurance tests and rolling-element fatigue tests were conducted to compare the performance of spur gears made from AISI 9310, CBS 600 and modified Vasco X-2 and to compare the pitting fatigue lives of these three materials. Gears manufactured from CBS 600 exhibited lives longer than those manufac-

tured from AISI 9310. However, rolling-element fatigue tests resulted in statisitcally equivalent lives. Modified Vasco X-2 exhibited statistically equivalent lives to AISI 9310. CBS 600 and modified Vasco X-2 gears exhibited the potential of tooth fracture occurring at a tooth surface fatigue pit. Case carburization of all gear surfaces for the modified Vasco X-2 gears results in fracture at the tips of the gears. Author

EFFECT OF GEOMETRY AND OPERATING CONDITIONS ON SPUR GEAR SYSTEM POWER LOSS
Neil E. Anderson and Stuart H. Loewenthal 1980 31 p refs Proposed for presentation at 3d Intern. Power Transmission and Gearing Conf., San Francisco, Calif., 18-22 Aug. 1980; sponsored by Am. Soc. of Mech. Engr.
(NASA-TM-81426; E-350; AVRADCOM-TR-80-C-2) Avail: NTIS HC A03/MF A01 CSCL 20I

The results of an analysis of the effects of spur gear size, pitch, width, and ratio on total mesh power loss for a wide range of speeds, torques, and oil viscosities are presented. The analysis uses simple algebraic expressions to determine gear sliding, rolling, and windage losses and also incorporates an approximate ball bearing power loss expression. The analysis shows good agreement with published data. Large diameter and fine pitched gears had higher peak efficiencies but low part load efficiency. Gear efficiencies were generally greater than 98 percent except at very low torque levels. Tare (no-load) losses are generally a significant percentage of the full load loss except at low speeds. Author

N80-18407*# National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.
CONSTRAINED FATIGUE LIFE OPTIMIZATION OF A NASVYTIS MULTIROLLER TRACTION DRIVE
John J. Coy, Douglas A. Rohn, and Stuart H. Loewenthal 1980 20 p refs Proposed for presentation at 3d Intern. Power Transmission and Gearing Conf., San Francisco, Calif., 18-22 Aug. 1980; sponsored by Am. Soc. of Mech. Engr.
(NASA-TM-81447; AVRADCOM-TR-80-C-6; E-214) Avail: NTIS HC A02/MF A01 CSCL 13I

A contact fatigue life analysis method for multiroller traction drives is presented. The method is based on the Lundberg-Palmgren analysis method for rolling element bearing life prediction, and also uses life adjustment factors for materials, processing, lubrication, and effect of traction. The analysis method is applied in an optimization study to the multiroller traction drive, consisting of a single-stage planetary configuration with two rows of stepped planet rollers of five rollers per row. The drive was approximately 25 centimeters in diameter by 11 centimeters long, having a nominal ratio of 15:1. The theoretically predicted drive life was 2510 hours at a nominal continuous power and speed of 74.6 kW (100 hp) and 7500 rpm. Author

N80-18408*# National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.
ANALYSIS AND DESIGN OF A UNIFORM-CLEARANCE, PUMPING-RING ROD SEAL FOR THE STIRLING ENGINE
I. Etsion Mar. 1980 30 p refs
(NASA-TM-81463; E-080) Avail: NTIS HC A03/MF A01 CSCL 11A

A uniform clearance pumping ring, as opposed to the conventional taper clearance one, is described. The uniform clearance concept eliminates complex elastohydrodynamic problems and enables a simple analytical treatment to be made. An analytical expression is derived for the pumping rate showing the effect of various design parameters on the pumping ring's performance. An optimum clearance is found by which the pumping rate is maximized and a numerical example is presented to demonstrate the potential of the uniform clearance design. Author

N80-18409*# National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.
SOME LIMITATIONS IN APPLYING CLASSICAL EHD FILM-THICKNESS FORMULAE TO A HIGH-SPEED BEARING
John J. Coy and Erwin V. Zaretsky 1980 32 p refs Proposed for presentation at Intern. Lubrication Conf., San Francisco, 18-21 Aug. 1980; sponsored by Am. Soc. of Mech. Engr. and Am. Soc. of Lubrication Engr.
(NASA-TM-81431; AVRADCOM-TR-80-C-3; E-198) Avail: NTIS HC A03/MF A01 CSCL 13I

Elastohydrodynamic film thickness was measured for a 20 mm ball bearing using the capacitance technique. The bearing was thrust loaded to 90, 448, and 778 N. The corresponding maximum stresses on the inner race were 1.28, 2.09, and 2.45 GPa. Test speeds ranged from 400 to 14,000 rpm. Film thickness measurements were taken with four different lubricants: (1) synthetic paraffinic; (2) synthetic paraffinic with additives; (3) neopentylpolyol (tetra) ester; and (4) synthetic cycloaliphatic hydrocarbon traction fluid. The test bearing was mist lubricated. Test temperatures were 300, 338, and 393 K. The measured results were compared to theoretical predictions and are presented. A.W.H.

HANDBOOK OF VIBRATION AND NOISE CONTROL Final Report
J. C. Snowdon 27 Apr. 1979 204 p refs
(Contract N00024-79-C-6043)
(AD-A071485; ARL/PSU-TM-79-75) Avail: NTIS HC A10/MF A01 CSCL 20/11

The static and dynamic properties of rubberlike materials are reviewed initially, followed by discussion of the simple and compound mounting systems. Reference is also made to the dynamic vibration absorber and to the measurement of mount transmissibility. Three sections then describe the natural frequencies, the mechanical impedances, and the transmissibility of structural members. Finally, four-pole parameter analyses are reviewed and the relative transmissibility of various mounting systems supported by a variety of non-rigid foundations is discussed. GRA

LABORATORY INVESTIGATION OF THE PERFORMANCE OF A HOLDEN ENGINE OPERATING ON LIQUIFIED PETROLEUM GAS
N. Webb Aug. 1979 49 p
(AD-A076145; EDE-28/79) Avail: NTIS HC A03/MF A01 CSCL 14/2

A laboratory investigation into the relative performances of an engine when operated on both liquified petroleum gas (LPG) and petrol showed that the engine operated at higher terminal efficiency on LPG and also that it would operate satisfactorily at leaner air-fuel mixtures on this fuel. Engine performance was less affected by retarded ignition for LPG than for petrol. Furthermore, a large increase in dwell angle from the recommended setting had no significant effect on LPG performance. The LPG carburettor when installed in its normal configuration maintained an essentially constant mixture strength with no part throttle leaning of mixtures to give better efficiency nor corresponding full throttle enrichment to give best engine torque. GRA

ALTERNATIVE METHOD FOR THE EVALUATION OF FUSED GLASS-TO-METAL SEALS Final Technical Report, 19 Jan. 1978 - 19 Feb. 1979
G. F. Trojanowski and L. Zakraysek Griffiss AFB, N.Y. RADC May 1979 52 p refs
(Contract F30602-78-C-0086; AF Proj. 2338)
(AD-A077514; PM-13-79; RADC-TR-79-98) Avail: NTIS HC A04/MF A01 CSCL 11/1

Glass-to-metal seals on electronic component packages make it possible to obtain electrical feed-thru while maintaining hermeticity throughout severe environmental exposure. As a result of this study, it was determined that sealed sub-assemblies will generally pass the least severe thermal shock requirement of MIL-STD-883, but that the same (previously accepted) lots will exhibit a 6%, or higher, failure rate as a result of manufacturing stresses imposed by cover welding, delidding, and thermal bakes or soaks. During this study, the use of tighter controls on the

more critical glass sealing processes was shown to reduce the reject rate to less than 1%. Success in matched glass-seal making depends on the use of three thermal treatments for Kovar: de-carburizing, pre-oxidation and sealing. This report deals specifically with pre-oxidation and sealing. An oxide film on Kovar, prior to sealing, promotes glass wetting and provides for the development of a chemical-mechanical bond at the glass-metal interface. A determination for residual intergranular oxide is useful for judging the quality of a matched glass-to-metal seal where pre-oxidation is a requisite for sealing. Residual oxides can be detected by metallographic techniques, and the range of 2.0 - 6.5 micrometers is appropriate for high quality glass seals. Other effects are also detectable by the evaluation of metallographic cross-sections of sealed packages. These include volume fraction of bubble formation, bubble size, bubble distribution, glass-metal separation and other interface criteria. GRA

THE INFLUENCE OF ROAD ROUGHNESS ON THE BRAKING AND STEERING PERFORMANCE OF CARS
Georg Magnusson and Peter W. Arnberg 1977 46 p refs In SWEDISH; ENGLISH summary
(VTI-134) Avail: NTIS HC A03/MF A01

Information was compiled concerning the influence of road roughness on automobile braking and steering characteristics, and on driver performance. Evidence found indicates that road roughness has a degrading effect on wheel load and therefore steering ability, but contradictory findings exist for its effects on braking performance. Drivers' visual, auditory, and kinesthetic information acquisition as well as steering ability are influenced by vibration, but it is not clear that it is important to traffic safety. Author (ESA)

RELIABILITY ANALYSIS FOR OPTIMUM DESIGN
A. O. Payne and A. D. Graham 14 Sep. 1978 18 p refs Repr. from Eng. Fracture Mech., Great Britain, v. 12, 1979 p 329-346
(ICAF-1132) Avail: NTIS HC A02/MF A01

An approach is presented which offers a means of enabling the influence of significant design parameters to be studied and the design to be optimized. It is illustrated by two applications-assessment of ultimate load design procedures for an offshore drilling unit and the derivation of a reliability based inspection procedure for a crop-dusting aircraft. The approach requires extensive data not normally available in design and is still in the development stage, but it is seen as an approach to achieving an optimum design. R.E.S.

THE APPLICATION OF RELIABILITY IMPROVEMENT WARRANTY TO DYNAMIC SYSTEMS Final Report, 28 Sep. 1978 - 4 Sep. 1979
A. A. Bilodeau, F. B. Crum, W. A. Dunphy, and R. A. Kowalski 4 Sep. 1979 162 p
(Contract DAAK70-78-C-0200)
(AD-A075520; Rept-1736-01-1-2025; MERADCOM-TQ-1) Avail: NTIS HC A08/MF A01 CSCL 14/4

The Reliability Improvement Warranty (RIW) is currently used within the Department of Defense to provide an incentive to contractors to design and produce equipment that will have a low failure rate, as well as low costs of repair following failure in field or operational use. Current applications of RIW have generally been restricted to initial production procurements of relatively small, transportable avionics equipment. The RIW concept has potential applications for dynamic systems (e.g., transmissions, gearboxes, engines, etc.) procured by the U.S. Army Mobility Equipment Research and Development Command (MERADCOM). However, dynamic systems may differ from avionics in design and maintenance concepts, transportability features, and deployment and utilization philosophy. Therefore, current criteria for using RIW and current guidelines for developing RIW terms and conditions should be reviewed and adapted for this new class of systems. This effort identified several differences between the characteristics of dynamic systems and those of RIW avionics equipment that are not emphasized in current RIW guidelines. RIW application criteria for dynamic systems were also developed. An existing life-cycle cost (LCC) model was modified to address quantitative features of dynamic systems that should be considered in an economic analysis of RIW versus organic maintenance. Case studies were developed to demonstrate the use of the RIW selection criteria and the LCC model. GRA

THE PROCESSING RESOURCE DEMANDS OF FAILURE DETECTION IN DYNAMIC SYSTEMS
Christopher D. Wickens and Colin Kessel Jan. 1979 27 p refs
(Grant AF-AFOSR-3380-77)
(AD-A078329; EPL-79-1/AFOSR-79-1; AFOSR-79-0684TR)
Avail: NTIS HC A03/MF A01 CSCL 05/8

A conception of human attentional resources is presented that describes these resources, not as an undifferentiated pool of capacity, but as partitioned into separate structure-specific reservoirs related to the processes of encoding, central processing and responding. An experiment is then described in which subjects detected dynamic system failures, either while actually tracking the control dynamics (manual mode), or while passively observing an autopilot controlling the dynamics (automatic mode). Failure detection, the primary task was performed alone, and with each of two structurally different loading tasks: mental arithmetic and a critical instability tracking task. Manual detection and primary task tracking were affected by the critical tracking task but not by mental arithmetic. The opposite pattern of interference was found for automatic detection. Assuming that manual and automatic detection depend upon different information sources, these results are shown to be compatible with the concept of structure-specific resources. GRA

MIXED-MODE FRACTURE ANALYSIS USING A CONSERVATION INTEGRAL Ph.D. Thesis
Jen-fu Yau 1979 116 p
Avail: Univ. Microfilms Order No. 8004309

An efficient and convenient method of analysis for determining stress intensity factors for two-dimensional mixed mode fracture problems with complicated geometry and loading conditions (static or dynamic) is presented. The method is applicable to a wide variety of material properties including linear elastic isotropic, anisotropic, as well as isotropic bimaterials and linear viscoelastic behavior. One of the salient features of the present analysis is that it can directly determine mixed mode stress intensity solutions from the conservation integral without the need of solving the corresponding complex boundary value problem. This method is demonstrated to be superior in its numerical simplicity to other approaches, since the conservation integral can be conveniently evaluated along a path removed from the crack tip region. Solutions of complicated and practical engineering problems such as cracks emanating from a circular hole and a crack branching from an edge crack in a fibrous composite are presented. Dissert. Abstr.

COLLAPSE LOAD ANALYSIS FOR PLATES AND PANELS Ph.D. Thesis
Kailasam Satyamurthy 1979 101 p
Avail: Univ. Microfilms Order No. 8003339

A FORTRAN, large capacity computer program was developed to determine collapse loads and bifurcation loads for fiber reinforced, laminated, circular cylindrical panels with rectangular plan form and rectangular plates under general loading systems and boundary conditions. The program is based on the principle of total potential energy and uses finite difference in the discretization process. Whole station spacing was used to calculate the strain energy associated with an area element and an orthogonal finite difference grid that provides for variable spacings in perpendicular directions is incorporated. Numerical results for isotropic panels are presented that compare favorably with results obtained via the general computer program STAGS. Other numerical results for fiber reinforced, laminated panels are also presented that illustrate the types of boundary conditions, applied loads, cut-outs, and initial geometric imperfections that can be handled by the present program. Dissert. Abstr.

N80-18425 Illinois Univ. at Urbana-Champaign.
BOUNDARY INTEGRAL EQUATION SOLUTION OF PLANE ELASTICITY PROBLEMS WITH HIGH STRESS CONCENTRATIONS Ph.D. Thesis
Hassan Nikooyeh 1979 133 p
Avail: Univ. Microfilms Order No. 8004240

A numerical method for determination of stresses in two-dimensional elastic bodies with high stress concentration is presented. Major emphasis is placed on bodies with a notch having a fillet of small radius and bodies with a crack of small width. These static boundary value problems are formulated in terms of boundary integral equations of a type used previously for sharp notches and cracks. The results for the fillet problem are used to develop analytical solutions for the intermediate region adjacent to the fillet region. In this way the details of the boundary configuration of the fillet are reflected in a set of generalized displacements which characterize the intermediate field. For the solution of the whole body including the loaded boundary, kernels are used to pick out the generalized displacements of the intermediate region. The solution of the wide crack problem is similar except that a perturbation scheme is required to ensure homogeneous boundary conditions at the actual edges of the crack. Dissert. Abstr.

N80-18426 Colorado Univ. at Boulder.
RESPONSE OF A CIRCULAR CYLINDRICAL SHELL TO DISTURBANCES IN A HALF-SPACE Ph.D. Thesis
Nabil Mohamed El-Akily 1979 206 p
Avail: Univ. Microfilms Order No. 8002971

The problem of determining the steady state dynamic response of a circular cylindrical shell to disturbances in a half-space is discussed. Both the shell and the surrounding medium are assumed to be linearly elastic, isotropic, and homogeneous and the shell is assumed to be in welded contact with the surrounding medium. Approximate solutions for the response of the shell and as a limiting case of the shell, the solutions for the cavity are presented. The solutions in both cases are obtained by two different methods. First, the method of matched asymptotic expansions

is used. The second method of solution (the method of successive reflections) is based on assuming two infinite series representing the scattered field. The usefulness and the range of applicability of each method is established for the cases studied.

Dissert. Abstr.

STRESS ANALYSIS AND BUCKLING OF J-STIFFENED GRAPHITE-EPOXY PANEL
Randall C. Davis Washington Feb. 1980 23 p refs
(NASA-TP-1607; L-13256) Avail: NTIS HC A02/MF A01 CSCL 20K

A graphite epoxy shear panel with bonded on J stiffeners was investigated. The panel, loaded to buckling in a picture frame shear test is described. Two finite element models, each of which included the doubler material bonded to the panel skin under the stiffeners and at the panel edges, were used to make a stress analysis of the panel. The shear load distributions in the panel from two commonly used boundary conditions, applied shear load and applied displacement, were compared with the results from one of the finite element models that included the picture frame test fixture. STRESS INTENSITY FACTORS IN TWO BONDED ELASTIC LAYERS CONTAINING CRACKS PERPENDICULAR TO AND ON THE INTERFACE. PART 1: ANALYSIS
Ming-Che Lu and F. Erdogan Jan. 1980 31 p refs 2 Vol. (Grants NGR-39-007-011; NSF ENG-78-09737)
(NASA-CR-159218) Avail: NTIS HC A03/MF A01 CSCL 20K

The basic crack problem which is essential for the study of subcritical crack propagation and fracture of layered structural materials is considered. Because of the apparent analytical difficulties, the problem is idealized as one of plane strain or plane stress. An additional simplifying assumption is made by restricting the formulation of the problem to crack geometries and loading conditions which have a plane of symmetry perpendicular to the interface. The general problem is formulated in terms of a coupled system of four integral equations. For each relevant crack configuration of practical interest, the singular behavior of the solution near and at the ends and points of intersection of the cracks is investigated and the related characteristic equations are obtained. The edge crack terminating at and crossing the interface, the T-shaped crack consisting of a broken layer and a delamination crack, the cross-shaped crack which consists of a delamination crack intersecting a crack which is perpendicular to the interface, and a delamination crack initiating from a stress-free boundary of the bonded layers are some of the practical crack geometries considered. A.R.H.

FRACTURE MECHANICS IN JAPAN
Takeo Yokobori 1978 20 p refs Repr. from Fracture Mech., Proc. Intern. Symp. on Fracture Mech., 1978 p 91-109 Presented at Intern. Symp. on Fracture Mech., Washington, D.C., 1978
(ICAF-1123) Avail: NTIS HC A02/MF A01

A brief survey of fracture mechanics studies in Japan is given. Combined micro and macrofracture mechanics including both crack and crystal dislocation as stress concentrators, rate process theory and nucleation theory of fracture, including both thermal fluctuation and macroscopic stress concentration such as crack are among the topics examined. Comparative fracture studies, on cracked specimens and uncracked specimens, on brittle fracture and fatigue, crack arrest for fracture design, and high temperature strength and fracture are included. ESTIMATION OF THE FATIGUE STRENGTH OF WELDED JOINTS BASED ON NON-DESTRUCTIVE TEST RESULTS
Kunihiko Satoh and Kenji Seo Mar. 1979 17 p refs Repr. from Proc. 1st Conf. on N.D.T., R.O.C. (Japan), Mar. 1979 17p
(ICAF-1125) Avail: NTIS HC A02/MF A01

The relationship between the fatigue strength of welded joints and the results of nondestructive test was investigated experimentally. Furthermore, statistical data of stress concentration factor caused by porosities were obtained by finite element method. It was found that the fatigue strength of welded joints with porosites could be estimated theoretically by using these statistical data and the fatigue strength reduction factor. Author

LOCAL RESIDUAL STRESS NEAR FATIGUE CRACK TIP
Shuji Taira and Keisuke Tanaka 1978 9 p refs Repr. from Trans. Iron Steel Inst. Jap. (Japan), v. 19, 1979 p 411-418
(ICAF-1129) Avail: NTIS HC A02/MF A01

The distribution of residual stress near the tip of a fatigue crack propagating under constant amplitude stress cycling accompanied by several cycles of overloads was measured using an X-ray microbeam diffraction technique. The residual stress measured in the close vicinity of the crack tip was compressive and gradually changed to tensile at a certain distance from the crack tip. The compressive residual stress became higher as the number of overload cycles increased. The high compressive residual stress may be responsible for a large amount of growth retardation of a fatigue crack due to increasing numbers of overload cycles. A theoretical method to predict the growth rate of a fatigue crack from information on the local residual distribution near the tips of fatigue cracks is presented. K.L.

ACTION OF PLASTIC DEFORMATIONS IN THE MECHANICAL DAMAGE SUFFERED BY THE SURFACE OF STRUCTURES
William Barrois 1979 19 p refs In FRENCH; ENGLISH summary
(ICAF-1114) Avail: NTIS HC A02/MF A01

After reviewing the essential features of the fatigue behavior of metal structures in service, it is shown that the elementary phenomena of plastic deformation and fatigue crack propagation,

which explain the fatigue behavior of notched parts, also play an important role in other modes of damage of machinery parts. This is the case for mechanical surface damage under repeated bearing pressure in the absence of any apparent lateral sliding, for fretting fatigue in which there is alternating lateral displacements of very low amplitude, and for false-brinelling marks in ball or roller bearings. It is also the case for unidirectional friction wear and for rolling damage, either with friction in gears or with very low friction in ball or roller bearings. R.E.S.

A RELIABILITY ANALYSIS APPROACH TO FATIGUE LIFE DISPERSION OF LAMINATED GLASS FIBER COMPOSITE MATERIALS
T. Tanimoto, S. Amijima, H. Ishikawa (Kagawa Univ., Japan), K. J. Miller, ed. (Sheffield Univ., England), and R. F. Smith, ed. (Welding Inst., Cambridge, England) Oxford, England Pergamon Press 1979 11 p refs Repr. from ICM, England Presented at the 3d Intern. Conf. on Mech. Behavior of Mater. Cambridge, England, 20-24 Aug. 1979
(ICAF-1127) Avail: NTIS HC A02/MF A01

The statistical nature of the fatigue life of laminated glass fiber composite materials (FRP) is studied. Four different FRP laminates (satin woven FRP, plain woven FRP, roving woven FRP, and SMC laminated FRP) were used in the experiments. Unidirectional carbon fiber reinforced plastic was used for comparison. P-S-N diagrams for each laminate are presented. A statistical approach based on the Weibull distribution was applied to the test data to evaluate the dispersion in the fatigue life of the material. The effect of varying applied stress levels, specimen size, and glass fiber content on the fatigue life and its dispersion of the laminates is discussed. A.W.H.

MINITWIST: A SHORTENED VERSION OF TWIST
H. Lowak, J. B. DeJonge, J. Franz, and D. Schuetz 1979 25 p refs In GREEK
(LBF-TB-146) Avail: NTIS HC A02/MF A01

A description of the shortened version of the transport wing standard load program (TWIST), called MINITWIST, is presented. In all cases where testing time is a prohibitive factor to use TWIST, it is proposed to use this shortened program. The user of this shortened program should be aware though that in most cases the load cycles with high frequency and low amplitude omitted in MINITWIST would contribute to damage; thus the results will overestimate the fatigue life. R.E.S.

FATIGUE MEASURING GAUGES (FMG): A NEW SYSTEM FOR MONITORING FATIGUE LOADS
W. Ludwig, K. F. Sahm, and E. Steinheil 1979 23 p Presented at Tenth ICAF Symp., 17 May 1979, Brussels
Avail: NTIS HC A02/MF A01

An optical fatigue measuring gage (FMG), which provides monitoring of ingegral fatigue loads of individual structural units up to any given state in operational life, is described and evaluated. It is based on specially prepared, polished, and annealed metal foils which are cemented to the sites of structural units to be controlled, and which have the property of storing dynamic loads via well defined changes in surface properties due to plastic deformation. The measuring apparatus is made up of an optical measuring head and a display unit. The measuring head contains an illumination system with lenses producing a parallel beam as well as electron optical receivers. The FMG reveal information

on load history of structural units for the time the foils have been attached. The various possibilities for monitoring fatigue loads are described and FMG data are correlated with fatigue failure data of materials and structural units. M.G.

SEPARATION OF PRESTRESSED-TIME FUNCTIONS AFTER THEIR BEGINNING [TRENNUNG VON BEANSPRUCHUNGS-ZEITTUNKTIONEN NACH IHREM UPSPRUNG]
O. Buxbaum and J. M. Zaschel 1979 8 p refs Repr. from Sonderdruck aus Konstrwktion, West Germany, v. 31, no. 9, 1979 p 345-351 In GERMAN
Avail: NTIS HC A02/MF A01

Random stress-time histories as measured at structures in service consist usually of two parts, i.e., stresses caused by environment and by the so-called working process inherent in the usage of the structure. In order to obtain a reliable fatigue life assessment, these two parts must be separated before analysis is performed. Criteria are defined which can be used to identify either of the two parts. Based upon these criteria, methods for a separation were developed. It was demonstrated on a number of examples that for a wide range of stress-time histories two methods can be applied, i.e., frequency filtering and a separation of single stress variations characterized by shape and period. AEROELASTIC EQUATIONS OF MOTION OF A DARRIEUS VERTICAL-AXIS WIND-TURBINE BLADE
Krishna Rao V. Kaza (Toledo Univ.) and Raymond G. Kvaternik Dec. 1979 57 p refs
(Contract E(49-26)-1028)
(NASA-TM-79295; DOE/NASA/1028-79/25; E-238) Avail: NTIS HC A04/MF A01 CSCL 20K

The second-degree nonlinear aeroelastic equations of motion for a slender, flexible, nonuniform, Darrieus vertical-axis wind turbine blade which is undergoing combined flatwise bending, edgewise bending, torsion, and extension are developed using Hamilton's principle. The blade aerodynamic loading is obtained from strip theory based on a quasi-steady approximation of two-dimensional incompressible unsteady airfoil theory. The derivation of the equations has its basis in the geometric nonlinear theory of elasticity and the resulting equations are consistent with the small deformation approximation in which the elongations and shears are negligible compared to unity. These equations are suitable for studying vibrations, static and dynamic aeroelastic instabilities, and dynamic response. Several possible methods of solution of the equations, which have periodic coefficients, are discussed. K.L.

ANTI-PLANE SHEAR FIELDS WITH DISCONTINUOUS DEFORMATION GRADIENTS NEAR THE TIP OF A CRACK IN FINITE ELASTOSTATICS
J. K. Knowles and Eli Sternberg Sep. 1979 73 p refs
(Contract N00014-75-C-0196)
(AD-A076027) Avail: NTIS HC A04/MF A01 CSCL 20/11

This paper reconsiders the problem of determining the elastostatic field near the tip of a crack in an all-around infinite body deformed by a 'Mode 3' loading at infinity to a state of anti-plane shear. The problem is treated for a class of incompressible, homogeneous, isotropic elastic materials whose constitutive laws permit a loss of ellipticity in the governing displacement equation of equilibrium at sufficiently severe shearing strains. The analysis represents a generalization of that reported in an earlier study and, as before, is carried out for the 'small-scale nonlinear crack problem', in which a crack of finite length is replaced by a semi-infinite one, and the nonlinear field far from the crack-tip is matched to the near field predicted by the linearized theory. The methods employed in the present paper are necessarily largely qualitative, since they apply to all materials in the class considered. The principal feature of the resulting elastic field is the presence of two symmetrically located curves issuing from the crack-tip and bearing discontinuities in displacement gradient and stress. HLH ROTOR BOX BEAM FATIGUE TEST
M. Hanson Sep. 1979 21 p refs
(DA Proj. 1L1-62209-AH-76)
(AD-A076931; USARTL-TN-35) Avail: NTIS HC A02/MF A01 CSCL 20/11

The purpose of this program was to evaluate the fatigue properties of a fiberglass/epoxy box beam specimen which was similar in design to the Heavy Lift Helicopters (HLH) rotor blade spar. The fiberglass/epoxy box beam was designed and fabricated by Boeing Vertol using a ply layup scheme similar to the rotor HLH blade spar but with a different preimpregnated fiberglass tape. The box beam was tested at a fatigue load level sufficient to cause failure within a reasonable number of fatigue cycles (5 x 1000,000) to determine fatigue strength and observe failure modes and rates. Premature fatigue failure occurred in the box beam as the result of chordwise wrinkles occurring during fabrication. The Integral Spar Inspection System (ISIS), which depends on a pressure differential between the sealed spar and outside ambient pressure to detect leaks resulting from cracks or flaws, indicated that a leakage had occurred at approximately the same time the failure was observed. It was concluded that the ISIS appeared to be a viable technique for signaling a structural failure of fiberglass spars. The presence of the wrinkles in the spar which resulted in premature failure, however, precluded any

conclusions with regard to the fatigue strength of the preimpregnated fiberglass tape used. GRA

HC A02/MF A01 CSCL 20/11

This paper describes experimental and analytical procedures whereby the conventional commercial fracture mechanics clip-gage can be used for precision measurement of fatigue-crack-growth-rate in compact tension specimens. Potential sources of error in measuring crack length via COD techniques are delineated. Comparisons are made among crack length data obtained via specimen surface observations and crack-opening-displacement (COD) techniques. Comparisons are also made among data analyzed by the secant and 7-point incremental polynomial methods. It is emphasized that COD techniques can enhance the accuracy of the secant method of data reduction. Step-loading procedures using COD techniques are described. Proposed amendments to ASTM E647-78T regarding incrementing of crack-length measurements via COD techniques are discussed. GRA

This research program is intended to explore and develop commonalities in fracture theory as applied to wide classes of differing materials at different scales - from the atomic to the continuum. Primary attention is focused upon analytical and experimental methods needed to analyze underlying and potentially common basic mechanisms controlling the fracture process, e.g., two and three dimensional stress singularities, effect of environment, etc. and to examine structure-property relationships, including the effect of the fabrication process upon the preparation of specimens made from standardized model materials representative of polymers and metals. Secondary emphasis is focused upon numerical analysis methods needed at various scale levels, atomic to continuum, and instrumentation capability peculiarly suited to or needed for fracture studies. In later stages of the program, increasing attention will be devoted to technology transfer and engineering applications of the basic research. Major results during the first year include: (1) the development of a test for measuring Mode 2 fracture toughness, and (2) quantifying the effect of geometry in an embedded fiber or rod and the location of initial interfacial debonding from the matrix upon resulting adhesive fracture under load. HC A03/MF A01 CSCL 20/11

A Stress-Strain-Time Model (SST) has been developed to predict high-temperature, low-cycle fatigue life. The model states that the life can be predicted by three variables--stress, strain, and time. These three variables are combined in a power-law equation to predict the life. The stress parameter accounts for mean stress effects. The strain parameter accounts for time-independent fatigue damage, and the time parameter accounts for the time dependence of fatigue life. High-temperature, low-cycle fatigue data for several alloy systems are correlated to within a factor of 2.1, and data are predicted to within a factor of 2.6 using the SST Model. GRA

A NUMERICAL APPROACH TO ELASTIC-PLASTIC PLAIN-STRAIN PROBLEMS OF THICK-WALLED CYLINDERS
P. C. T. Chen Oct. 1979 22 p refs Proposed for Presentation at the 10th Southeastern Conf. on Theoret. and Appl. Mech., Knoxville, Tenn., 17-18 Apr. 1980
(DA Proj. 1L1-61101-A-91A)
(AD-A078365; ARLCB-TR-79026) Avail: NTIS
HC A02/MF A01 CSCL 12/1

A new finite-difference approach has been developed for solving the elastic-plastic plane-strain problems of thick-walled cylinders subjected to internal or external pressure. The material is assumed to obey the von Mises' yield criterion, the Prandtl-Reuss flow theory and the isotropic hardening rule. The numerical scheme is stable for ideally-plastic as well as straining-hardening materials. The approach is simpler than others, and very accurate solutions can be obtained by reducing the grid sizes and load increments. The results for the stresses and strains in all principal directions have been computed as functions of loading history. GRA

BENDING STRENGTH OF VERTICALLY GLUED LAMINATED BEAMS WITH ONE TO FIVE PLIES
Ronald W. Wolfe and Russell C. Moody 1979 23 p refs Prepared in cooperation with Wisconsin Univ., Madison
(AD-A077173; FSRP-FPL-333) Avail: NTIS
HC A02/MF A01 CSCL 11/12

Properties of vertically laminated beams were studied to determine the effects of number and quality of component laminations on structural performance. Deterministic and probabilistic analyses were both used to show how performance varies with number and quality of laminations and with assumed loading parameters. Increase in allowable stress with number of laminations, currently recognized as a constant adjustment for three or more laminations, was significant for two-lamination beams as well. This increase proved to be inversely related to lumber quality. Results will be helpful to organizations publishing engineering design stresses in establishing a more efficient design of vertically laminated beams. GRA

BENDING PROPERTIES OF NON-HOMOGENEOUS PLATES OF ISOTROPIC AND ORTHOTROPIC MATERIALS [BOEJSTYVHET HOS EN ICKE-HOMOGEN PLATTA AV ISOTROPT OCH ORTOTROPT MATERIAL]
Pavel Sindelar 1977 24 p refs In SWEDISH
(TRITA-HFL-21) Avail: NTIS HC A02/MF A01

The bending properties of laminated plates composed of several layers of different homogeneous materials was studied. Isotropic and orthotropic materials were considered. A bending theory for thin, uniform, and flat plate was developed. The corresponding equations are presented together with numerical examples. It is shown that while the orthotropy and the width ratio have a noticeable influence on the bending characteristics, the shearing force ratio is of minor importance. Author (ESA)

FRACTURE MECHANICS STUDY OF FRESH WATER ICE [BROTTMEKANISKA STUDIER AV FAERSKVATTENIS]
Holger Droege Dec. 1975 70 p refs In SWEDISH
(TRITA-HFL-0021; Publ-201) Avail: NTIS HC A04/MF A01

Various experiments done on fresh water ice are reported. Some general physical characteristics and data linked to elasticity research are described. The results of fracture elasticity experiments on artificial fresh water ice at -10 C are given. A special hydraulic press was used and displacement, force, and time were registered by two X-Y recorders. Polarized light photographs were taken. Load rates of 100 14, and 1.3 N/s were used. Only for the 100 and 14 N/s was fracture elasticity found in accordance with linear fracture mechanics prediction. The average value of fracture elasticity was 0.16 and 0.26 mega newton per meter to the 3/2 power respectively. The corresponding values for the re-iced test samples are 0.13 and 0.19 MN/m to the 3/2 power respectively. Author (ESA)

FATIGUE CRACK GROWTH IN LUGS AND THE STRESS INTENSITY FACTOR
J. Schijve and A. H. W. Hoeymakers Jul. 1978 28 p refs
(VTH-LR-273) Avail: NTIS HC A03/MF A01

Crack growth in aluminium alloy lugs was recorded during constant amplitude loading (R = 1/3). Observations were made both for artificial cracks started by a small saw cut and natural cracks started by fretting corrosion between hole and pin. Scatter was low for artificial cracks, whereas considerable scatter was seen at the natural cracks as a result of multiple crack initiation at different times and locations. The fastest crack growth was observed for artificial cracks which appear to be a worst case as compared to natural cracks. The K-values derived from crack growth results were in good agreement with K-values reported in the literature. Author (ESA)

UTILIZATION OF 'STAGS' TO DETERMINE KNOCKDOWN FACTORS FROM MEASURED INITIAL IMPERFECTIONS
Johann Arbocz and C. D. Babcock Nov. 1978 88 p refs
(VTH-LR-275) Avail: NTIS HC A05/MF A01

Various methods for predicting the buckling load of axially compressed stringer stiffened shells in the presence of initial imperfections were evaluated. Both simplified analytical methods and refined computer codes based on finite difference energy formulation (STAGS) were used. The analytical predictions were validated by comparison with the experimentally determined buckling load. A method is proposed which makes it possible to take into account both the effect of initial imperfections and the effect of the appropriate boundary conditions. Author (ESA)

Main features of solar activity are described in relation to solar and geophysical forecasting. Spectroheliograms, radio and X-ray data, white light coronal observations, particles data, photospheric images, and photospheric magnetic fields are among the types of data used to identify the active centers and flares of the Sun. Forecasting and identification of geomagnetic activity is also discussed. The forecasting technique is described along with the types of users. J.M.S.

FORECASTS OF GEOMAGNETIC ACTIVITIES AND HF RADIO PROPAGATION CONDITIONS MADE AT HIRAISO/JAPAN **c32**
K. Marubashi, Y. Miyamoto, T. Kidokoro, and T. Ishii *In* NOAA Solar-Terrest. Predictions Proc., Vol. 1 Aug. 1979 p 182-204 refs (For primary document see N80-18462 09-42)
Avail: NTIS MF A01; SOD HC CSCL 20N

The Hiraiso Branch of RRL prediction techniques are summarized separately for the 27 day recurrent storm and the flare-associated storm. The storm predictions are compared with the actual geomagnetic activities in two ways. The first one is the comparison on a day to day basis. In the second comparison, the accuracy of the storm predictions during 1965-1976 are evaluated. In addition to the storm prediction, short-term predictions of HF radio propagation conditions are conducted at Hiraiso. The HF propagation predictions are briefly described as an example of the applications of the magnetic storm prediction. M.M.M.

A DISTURBANCE FORECASTER'S VIEW OF THE SEPTEMBER 1977 EVENTS **c46**
F. E. Cook *In* NOAA Solar-Terrest. Predictions Proc., Vol. 1 Aug. 1979 p 239-248 refs (For primary document see N80-18462 09-42)
Avail: NTIS MF A01; SOD HC CSCL 04A

The solar-geophysical events of 1977 September 7-26 are presented. A variety of disturbance forecasting problems, viz. disc transit of a center of activity with high microwave flux but relatively low meter-wave flux, flares in this region near east limb, central meridian, and west limb with major radio events, and the presence of two coronal holes, were observed. The Sydney daily GEOSYD message and IPS Disturbance Warnings issued during this period are related to the solar geophysical data available, at the time, about these events. M.M.M.

N80-18484*# Ionospheric Prediction Service, Darlinghurst (Australia). Dept. of Science and the Environment.
THE USE OF IONOSPHERIC INDICES TO MAKE REAL- AND NEAR-REAL-TIME FORECASTS OF foF2 AROUND AUSTRALIA **c46**
L. F. McNamara *In* NOAA Solar-Terrest. Prediction Proc., Vol. 1 Aug. 1979 p 249-258 refs (For primary document see N80-18462 09-42)
Avail: NTIS MF A01; SOD HC CSCL 04A

Two computer programs are used to forecast foF2 at points

around Australia from daily and hourly ionospheric indices. It is found that for forecasts one day ahead, the most accurate results are obtained using the past variations of foF2 at several stations to determine a latitudinal-average daily ionospheric index. Forecasts made with lead times of zero to three hours do not offer significant improvements over those made one day ahead. K.L.

N80-18485*# Ionospheric Prediction Service, Darlinghurst (Australia). Dept. of Science and the Environment.
PREDICTION LIMITS FOR foF2 **c46**
P. J. Wilkinson. *In* NOAA. Solar-Terrest. Predictions Proc., Vol. 1. Aug. 1979. p 259-278. refs (For primary document see N80-18462 09-42)
Avail: NTIS. MF A01; SOD HC. CSCL 04A

Some of the factors limiting the prediction of foF2 are investigated using median and hourly foF2 values recorded at stations in the Australian ionosonde network. Different time and spatial scales together with different levels of solar and geomagnetic activity are considered. All data used in the analysis are displayed in a series of scatter diagrams which provide an overall view of the accuracy limits for foF2 predictions. K.L.

N80-18486*# Ionospheric Prediction Service, Darlinghurst (Australia). Dept. of Science and the Environment.
A WEEKLY IONOSPHERIC INDEX **c46**
J. F. Turner and P. J. Wilkinson. *In* NOAA. Solar-Terrest. Predictions Proc., Vol. 1. Aug. 1979. p 279-287. refs (For primary document see N80-18462 09-42)
Avail: NTIS. MF A01; SOD HC. CSCL 04A

The monthly and weekly T indices are discussed. Some possibilities for improving the reliability of the weekly T index are considered, including extending its applicability to daily variations of the global ionosphere. K.L.

N80-18487*# Ionospheric Prediction Service, Darlinghurst (Australia). Dept. of Science and the Environment.
CORONAL HOLES INFERRED FROM THE FLEURS EAST-WEST SOLAR SCANS **c92**
Brian G. Ferguson. *In* NOAA. Solar-Terrest. Predictions Proc., Vol. 1. Aug. 1979. p 288-311. refs (For primary document see N80-18462 09-42)
Avail: NTIS. MF A01; SOD HC. CSCL 03B

East-West solar scans produced daily on 692 and 1415 MHz are analyzed for the period 1968 to 1973. The analysis confirms that coronal holes are stable features displaying significantly reduced electromagnetic emission which can persist for many solar rotations. The coronal hole observations are summarized in a series of tables. K.L.

Avail: NTIS. MF A01; SOD HC. CSCL 20N

A propagation assessment and forecasting terminal, PROPHET, is described. The terminal is a key element of the environmental prediction and assessment system which uses real time solar/geophysical data to provide real time knowledge of propagation conditions. The terminal uses models to translate data from satellite and ground based sources into performance predictions for specific systems. K.L.

Avail: NTIS. MF A01; SOD HC. CSCL 04A

The four Dimensional Ionospheric Model (4-D) is described. The 4-D integrates a wide variety of ionospheric data types into a consistent ionospheric specification. At each observing location, the 4-D reduces an entire electron density profile to four weighting coefficients. These weighting coefficients are interconnected in time and space by spectral analysis techniques. The resultant field of spectral coefficients can be used to reconstruct an electron density profile at any latitude, longitude and time. R.C.T.

Avail: NTIS. MF A01; SOD HC. CSCL 03B

The procedure to predict solar activity indexes for use in upper atmosphere density models is given together with an example of the performance. The prediction procedure employs a least square linear regression model to generate the predicted smoothed vinculum R sub 13 and geomagnetic vinculum A sub p(13) values. Linear regression equations are then employed to compute corresponding vinculum F sub 10.7(13) solar flux values from the predicted vinculum R sub 13 values. The output is issued principally for satellite orbital lifetime estimations. R.C.T.

FORECASTS OF GEOMAGNETIC ACTIVITY BY OTTAWA MAGNETIC OBSERVATORY: THEIR RELIABILTY AND APPLICATION **c46**
J. Hruska. *In* NOAA. Solar-Terrest. Predictions Proc., Vol. 1. Aug. 1979. p 398-405. refs. Sponsored in part by NOAA (For primary document see N80-18462 09-42)
Avail: NTIS. MF A01; SOD HC. CSCL 04A

A 27 day forecast of geomagnetic activity based on the forecasts from two locations is presented. To evaluate the reliability of the forecasts, the predicted activity was compared with the actual geomagnetic activity at five geomagnetic observatories located in different magnetic zones: Ottawa (57.0N, 351.5E);

Meanook (61.8N, 301.0E); Fort Churchill (68.8N, 322.5E); Cambridge Bay (76.7N, 294.0E); and Resolute Bay (83.1N, 287.7E). Results indicate that the percentage of correct predictions varies with the geomagnetic latitude of the observatory used for comparison. The percentage is on the average highest for lower latitude stations and lowest for the northern stations. The number of incorrect predictions ranges from 4.7% for Ottawa to 8.4% for Churchill. LAND USE AND CLIMATOLOGICAL PARAMETERS IN HUMID TROPICS [O CLIMA E O USO DA TERRA NOS TROPICOS UMIDOS]
Luiz Carlos Baldicero Molion and Juan Jose Verdesio Bentancurt Nov. 1979 28 p refs In PORTUGUESE; ENGLISH summary Presented at the 2d Simp. Nacl. de Ecol., Belem, Portugal, 19-24 Nov. 1979
(INPE-1630-RPE/092) Avail: NTIS HC A03/MF A01

The interaction of climatological parameters with different land use systems in the humid tropics is discussed. The climate of humid tropical regions is characterized as a function of large scale parameters and the differences of the energy and water balances terms over different ground cover types are discussed. It is shown that humid forests have a higher net radiation flux when compared to different cover types and, therefore, have more energy available to vaporize water. Consequently, the changeover from forest to other land uses modifies the regional climate. An attempt is made to identify techniques which would attenuate the land use effects on the climate of tropical regions. M.G.

RADAR TARGET FOR REMOTELY SENSING HYDROLOGICAL PHENOMENA Patent
Willford E. Sivertson, Jr., inventor (to NASA) Issued 15 Jan. 1980 6 p Filed 22 Sep. 1978 Supersedes N78-33511 (16 - 24, p 3231)
(NASA-Case-LAR-12344-1; US-Patent-4,184,155; US-Patent-Appl-SN-945041; US-Patent-Class-343-5CM; US-Patent-Class-343-5W; US-Patent-Class-343-18B; US-Patent-Class-343-18D) Avail: U.S. Patent and Trademark Office CSCL 08H

An apparatus for remotely measuring and accessing water status relative to snow and glacial melt, surface runoff, rainfall, evaporation, flow rate, and soil moisture is described. A radar target located at a selected location on the surface of the Earth is designed to collect water and render its cross sectional area variable as a function of the height of the water level within the target. The target is remotely monitored by an orbiting or airborne synthetic aperature radar. The target appears as a bright spot embedded within the radar image. The target brightness is indicative of the height of the water level within the ground located target.

AN EVALUATION OF MAP DESIGN AND MAP READING USING EYE MOVEMENT RECORDINGS Ph.D. Thesis
Theodore R. Steinke 1979 335 p
Avail: Univ. Microfilms Order No. 8002766

The eye movements of 60 subjects looking at a map were recorded using a corneal reflection technique in order to determine the parts of the map being observed, the time spent looking at the various parts, and the scanning sequence. One of three maps (having the same basic map body but with varying amounts of surrounding information) was shown to each group of 20 subjects to ascertain the effect of map design on map reading ability. All subjects reconstructed the map from memory shortly after eye movement recording. Analysis of the film shows attention was directed to the map body, title, and legend. The average time spent looking at the map was about 22 seconds, but ranged from 12.6 to 40.3 seconds. Reading was begun in the central and upper part of the map body or on the title. After this the gaze moved in very diverse directions with little unaminity in the location of the part last observed. There were relatively few differences in the way the maps transmitted geographic information to the readers as revealed by map reconstruction; however, maps with little or no surrounding information seem to function more efficiently. Dissert. Abstr.

MASS BALANCE AND ASPECTS OF THE GLACIER ENVIRONMENT, FRONT RANGE, COLORADO, 1969-1973 Ph.D. Thesis
James Benjamin Johnson 1979 308 p
Avail: Univ. Microfilms Order No. 8002987

Study of the topoclimate of the Arapaho Glacier and the Arikaree Glacier established solar radiation as a predominant factor in controlling the mass balance of glaciers in the Indian Peaks region of the Colorado Front Range. Due to avalanching from the cirque walls and the wind drift into the basins, snow accumulates to average depths of 5.5 m exceeding the regional accumulation. Ablation removes most of the snow pack each year. Albedos vary from around 0.8 in the early ablation season

down to 0.4 at the end of the summer. The change occurs primarily due to the accumulation of dust and debris at the surface of the snow pack and the amount of this contamination is the major control on the melt rates. The fact that this controlling factor exists suggests that melting of the glaciers can be augmented artificially be adding darkening materials to the early summer snow cover if desired. Accelerated melting would then leave a deeper topographic catchment for the next winter accumulation and potentially increase the water supply available from the alpine areas. Dissert. Abstr.

N80-18502 Florida Univ., Gainesville.
ANALYSIS OF FRESHWATER LENS FORMATION IN SALINE AQUIFERS Ph.D. Thesis
John Patrick Glass 1979 189 p
Avail: Univ. Microfilms Order No. 8002880

Results of laboratory tests using vertical Hele-Shaw models to determine the shape and rate of movement of the initially vertical interface between two fluids of different density show that, for relatively thick aquifers, it is not correct to neglect the vertical components of flow as has formerly been done. An analytical method is presented for the location of the boundary of a steady freshwater lens in a coastal aquifer. A pair of coupled ordinary differential equations is derived which describe the steady flow of freshwater injected into a leaky saline aquifer under the Dupuit assumption. A three dimensional finite element model is developed which can be used to locate the boundaries of a steady freshwater lens under a wide variety of conditions. A finite difference model developed for the U.S. Geological Survey is used to analyze the axisymmetric flow in transient freshwater lenses. Dissert. Abstr.

N80-18503 Utah State Univ., Logan.
WATERSHED CONSTITUENT LOADING ANALYSIS UTILIZING EMPIRICAL HYDROCHEMICAL MODELING TECHNIQUES Ph.D. Thesis
Jerald Stevens Fifield 1980 208 p
Avail: Univ. Microfilms Order No. 8005104

A simple modification to a hydrologic model in order to create a hydrochemical model is discussed and verified. Two basins along the Colorado River (the Grand Valley, Colorado, and Palo Verde, California) as well as along the Arkansas River in Colorado and Yakima River in Washington were used to acquire stream quality and quantity data. The modified deterministic model was calibrated on 80,200 acres of the Grand Valley, Colorado. Subsequent management runs indicate that only a not minimal reduction of salt loading to the Colorado River will be realized by lining canals, laterals and ditches whereas substantial reduction will result upon increased farm efficiency and/or reduction of spills. When optimal management conditions are met, sulfate will decrease the most and potassium the least. Dissert. Abstr.

N80-18504 California Univ., Davis.
TURBULENT MIXING PROCESSES IN A PARTIALLY MIXED ESTUARY Ph.D. Thesis
Robert Carl MacArthur 1979 341 p
Avail: Univ. Microfilms Order No. 8003523

A method of estimating the nature and magnitude of the parameters which describes the flow, in the region near the bed, located below the maximum density gradient in partially mixed estuaries is developed and validated. Accurate determination of these parameters allows the calculation of the vertical profiles of velocity and an estimation of the vertical turbulent mixing coefficients within this region. Calculated values of the local bed shear stress obtained from numerically integrating a form of the two dimensional momentum equation were found to be accurate when compared to the measured sediment bed shear strengths for various orders of aggregation throughout a mean tide. Orderly flows occur during specific periods of time during a tidal cycle and only within certain vertical regions of the flow within the Savannah estuary. Criteria are developed to be able to identify these periods of fully developed flow. Dissert. Abstr.

N80-18505 Utah State Univ., Logan.
FEATURE SELECTION AND CLASSIFIER DESIGN WITH APPLICATIONS TO REMOTE SENSING OF MULE DEER Ph.D. Thesis
Manmohan M. Trivedi 1980 134 p
Avail: Univ. Microfilms Order No. 8005119

The deer detection problem where the classification is performed in a multidimensional feature space. A generalized scene, of which the winter range may be considered typical is used in the classification. It includes the deer, evergreen trees, sagebrush, and dry brush against a snow background. A general interclass feature selection procedure, based upon clustering technique, was formulated and used to select best feature sets for the analysis. The classification performance was estimated by considering the a priori probabilities of 'not-deer' objects sufficiently high to eliminate the misclassification of not-deer objects into deer class. The three or four feature classifier was shown to be capable of providing useful deer census data in an operational system when combined with appropriate spatial classification techniques. Dissert. Abstr.

The author has identified the following signficant results. Examination of both machine estimates and stratified areal estimates produced by clustering and classification reveal no significant differences between the proportion estimates and ground truth estimates. When testing the variances of the machine estimates, a significant reduction in the variances was found when the number of starting dots was increased from 30 to 45. The variances were again reduced, although not significantly,

when the number of starting dots was increased from 45 to 60. From these results, 60 starting dots are recommended for a three-category classifier. When examining the variances of the estimates for the four estimation procedures (using 60 dots), no significant differences were found between procedures. Thus, only the machine clustering may be used to produce an estimate, and the stratified areal estimate computations and maximum likelihood classification can be deleted.

The author has identified the following significant results. Image processing techniques developed are well adapted to the exploration and isolation of local areas which exhibit small temperature differences between themselves and their surroundings. In the worst case of imagery of small areal extent of sea surface having no coastal boundary in the area, there is yet no method of distinguishing unambiguously an oil spill from fog, cloud, the effect produced by shallow sediments, or the effects of naturally occuring thermal fronts. In the case of uniform slicks of liquid North Sea oil in still air, laboratory simulation experiments show that, for oil thicknesses in excess of 1 or 2 mm, there is, under equilibrium conditions, little dependence of oil surface temperature on the thickness of the oil layer. The surface temperature of oil is consistently higher than that of water, the difference being about 1 K at low values of relative humidity, but tending to increase as the relative humidity increases.

The author has identified the following significant results. Cursory examination of the data indicates that the listed row tillage practices at 90 deg to the radar beam are approximately 12.5db higher than other comparable agricultural land. The Seasat radar data show evidence that the high return occurs only at a narrow range in look direction near the 90 deg. Such a high increase in return compared to a 15db range in film response would indicate that rows seen crosswise would saturate optically processed data. This response to row direction will have an adverse effect on monitoring agricultural lands with L band radar systems. Preliminary examination indicates that there is no sensitivity to soil moisture at the 5 deg look angle when using a like-polarized L band system. Some sensitivity was evident at a look angle of 20 deg and only a weak sensitivity was indicated at 40 deg look angle. At both 20 deg and 40 deg there is a significant response to soil moisture and none to row direction. Steep angles or the 5 deg look angle using cross polarized (HB) L band system appear insensitive to row direction and soil moisture.

The author has identified the following significant results. Detailed examination of Nite-IR images of intermontane basins in arid and/or semiarid areas of California discloses a ring or halo of relatively lighter greytone around the edges of each basin. Intermontane basins in the Northern Coast Range, however, do not show this thermal haloing. The topographic elevation of the haloes in arid basins shows seasonal variation, but it is present on nearly all images. A similar halo encircles many of the volcanoes on the Modoc Plateau and Southern Cascade Range. Although the halo around the arid intermontane basins can possibly be explained in relation to the location of alluvial fans (and perhaps water content of the rocks), a similar explanation cannot be made for the haloes around volcanoes or for the lack of haloes around basins in the Coast Range. Atmospheric thermal layering may be an alternative explanation; however, this explanation is also riddled with inconsistencies.

The author has identified the following significant results. Procedures to edit cloud-contaminated pixels from those pixels representing Earth surface features were investigated. Because clouds are more reflective than Earth features and are colder than Earth surface features most of the year at 26 N latitude, either a raw digital count ratio or a ratio of reflectance percentage for the VIS band to the temperature works well. For this procedure, the two bands of data need to be registered to the ground scene.

The author has identified the following significant results. Analysis of radar scatterometry data obtained over five flight lines in Texas by NASA C-130 aircraft demonstrated that multivariant radar data can be used to distinguish difference in land use, and hence be an indicator of surface runoff characteristics. The capability of using microwave sensors to detect flood inundation of timbered land was also determined.

EFFECT OF SOIL TEXTURE ON THE MICROWAVE EMISSION FROM SOILS
Thomas Schmugge Jan. 1980 32 p refs
(NASA-TM-80632) Avail: NTIS HC A03/MF A01 CSCL 08M
The intensity brightness temperature of the microwave emission from the soil is determined primarily by its dielectric properties. The large difference between the dielectric constant of water and that of dry soil produces a strong dependence of the soil's dielectric constant on its moisture content. This dependence is effected by the texture of the soil because the water molecules close to the particla surface are tightly bound and do not contribute significantly to the dielectric properties. Since this surface area is a function of the particle size distribution (soil texture), being larger for clay soils with small particles, and smaller for sandy soils with larger particles; the dielectric properties will depend on soil texture. Laboratory measurements of the dielectric constant for soils are summarized. The dependence of the microwave emission on texture is demonstrated by measurements of brightness temperature from an aircraft platform for a wide range of soil textures. It is concluded that the effect of soil texture differences on the observed values can be normalized by expressing the soil moisture values as a percent field capacity for the soil. A.R.H.

APPLICATION OF STATISTICAL CORRELATION IN THE STUDY OF AVAILABLE WATER IN LAYERS OF CERRADO SOIL [APLICACAO DE MODELOS DE ANALISE ESTATISTICA COM ESTRUTURA CORRELACAO EM ESTUDOS DE DISPONIBILIDADE DE AGUA EM SOLO DOS CERRADOS]
Joal Neves Barreto Oct. 1979 206 p refs In PORTUGUESE; ENGLISH summary
(INPE-1607-TDL/014) Avail: NTIS HC A10/MF A01
The use and extension of the method of time series analysis, as illustrated by the application to studies of the influence of density of planting on the availability of water in different layers of 'Cerrado' soil, is proposed. Three models are elaborated, that take into account, isolated or jointly, the experimental errors correlated both serial and contemporaneously. It is concluded that, for the data analyzed, the averages of the densities, layers and interactions, differ in behavior when analyzed together. The use of this method of analysis, by the adoption of models with correlated errors, is an answer, in specific instances, to the convenience of developing alternate methods of analysis which take into consideration a more adequate correlation structure. M.M.M.

THE UTILIZATION OF RADAR IMAGES IN THE GEOLOGICAL MAPPING OF PRE-CAMBRIAN REGION: A PROPOSED MODEL [A UTILIZCAO DE IMAGENS DE RADAR NO MAPEAMENTO DE AREAS PRE-CAMBRIANS: UMA PROPOSICAO DE METOPOLOGIA]
Paulo Roberto Meneses, Chan Chiang Liu, and Waldir Renato Paradella Sep. 1979 14 p In PORTUGUESE Presented at 2nd Regional Symp. of Simposio Regional de Geology Rio Claro, Brazil, 15-18 Nov. 1978 Revised
(INPE-1578-RPE/075) Avail: NTIS HC A02/MF A01
A method for geological mapping in the Pre-Cambrian regions of polycyclic and polyphasic evolution, when radar imagery (scale: 1:250,000) is used as the main data source is proposed. A multistage procedure is adopted in this study. First, a standard geological cross section is selected by data is then used as the basis of the next researching stage, photointerpretation of the radar imagery. It is shown that for a regional geological study, a prior field mapping of standard profils affords greater facility than the conventional procedure in which photointerpretation is made first. M.G.

ESTIMATION OF EFFECTIVE HYDROLOGIC PROPERTIES OF SOILS FROM OBSERVATIONS OF VEGETATION DENSITY M.S. Thesis
Tobin Eugene Tellers 1980 125 p refs
(Grant NsG-5306)
(NASA-CR-162797) Avail: NTIS HC A06/MF A01 CSCL 08M
An existing one-dimensional model of the annual water balance is reviewed. Slight improvements are made in the method of calculating the bare soil component of evaporation, and in the way surface retention is handled. A natural selection hypothesis, which specifies the equilibrium vegetation density for a given, water limited, climate-soil system, is verified through comparisons with observed data and is employed in the annual water balance of watersheds in Clinton, Ma., and Santa Paula, Ca., to estimate effective areal average soil properties. Comparison of CDF's of annual basin yield derived using these soil properties with observed CDF's provides excellent verification of the soil-selection procedure. This method of parameterization of the land surface should be useful with present global circulation models, enabling them to account for both the non-linearity in the relationship between soil moisture flux and soil moisture concentration, and the variability of soil properties from place to place over the Earth's surface. SIGNAL SIGNATURES OF TOPOGRAPHIC FEATURES USING ANALOG TECHNOLOGY
Pi-Fuay Chen and William W. Seemuller May 1979 37 p refs
(AD-A076110; ETL-0185) Avail: NTIS HC A03/MF A01 CSCL 09/2

Signal signatures and signatures of various spectral decompositions of selected topographic features, such as line roads, road intersections, and rectangular buildings, were developed by using analog signal processing techniques. The signal signatures were constructed in the spatial domain, and the corresponding signatures of various spectral components were obtained in the Walsh transform domain. An electronic system for generating two-dimensional Walsh functions for decomposition of topographic features was designed and built. A scheme for detecting the decomposed spectral components using an analog processor was presented. GRA

(Contract DAAK70-78-C-0062)
(AD-A076119; RSL-TR-370-2; ETL-0188) Avail: NTIS HC A11/MF A01 CSCL 17/9

The results are reported from applying radar image simulation to produce simulated reference scenes of winter conditions for a missile guidance usage. A data base was constructed of the Watertown, New York, test site and simulated radar images were generated. The data base was prepared from historical data for an 'average' winter at the test site. Simulated radar images were produced via the point scattering model and an empirical model was used for predicting the electromagnetic reflectance from the ground, its cover, and overlying snow. Copies of the simulated radar images are included. The results reported were obtained for four (4) simulations corresponding to four specific altitudes in the terminal phases of the trajectory of a guided missile, each successively lower. The simulated images have been produced for testing against actual radar data of the same site via the Correlatron. These tests have not been performed as the actual radar data have not yet been obtained. GRA

CHARGED DISLOCATION IN ICE. 1: EXISTENCE AND CHARGE DENSITY MEASUREMENT BY X-RAY TOPOGRAPHY
Kazuhiko Itagaki Nov. 1979 19 p refs
(DA Proj. 4A1-61102-AT-24)
(AD-A078775; CRREL-79-25) Avail: NTIS HC A02/MF A01 CSCL 08/12

The motion of dislocations in single crystal ice under an electric field was observed by using X-ray topographic methods. Electric charge density on these dislocations was deduced from the amplitude and length of the dislocation segment under the known ac electrical field. The most likely linear charge density was about -5 x 10 to the minus 11th power c/m, although considerable variation is possible depending on the effective field acting on the dislocation lines. GRA

CRYSTAL ALIGNMENTS IN THE FAST ICE OF ARCTIC ALASKA
W. F. Weeks and A. J. Gow Oct. 1979 29 p refs
(Grant NSF DPP-77-27479; NOAA-01-5-022-1651)
(AD-A077188; CRREL-79-22) Avail: NTIS HC A03/MF A01 CSCL 08/12

Field observations at 60 sites located in the fast or near-fast ice along a 1200-km stretch of the north coast of Alaska between Bering Strait and Barter Island have shown that the great majority of the ice samples (95%) exhibit striking c-axis alignments within the horizontal plane. Such alignments were usually well developed by the time the ice was 50 cm thick and in some cases when the ice was 20 cm thick. In all cases the degree of preferred orientation increased with depth in the ice. Representative standard deviations around a mean direction in the horizontal plane are commonly less than + or - 10 deg. for samples collected near the bottom of the ice. The general patterns of the alignments support a correlation between the preferred c-axis direction and the current direction at the ice/water interface. A comparison between c-axis alignments and spot current measurements made at 42 locations shows that the most frequent current direction coincides with the mean c-axis direction. Such alignments are believed to be the result of geometric selection with the most favored orientation being that in which the current flows normal to the (0001) plates of ice that compose the dendritic sea ice/sea after interface. GRA

BACKSCATTER MEASUREMENTS OF SEA ICE WITH A HELICOPTER-BORNE SCATTEROMETER
J. S. Patel, R. G. Onstott, C. V. Delker, and R. K. Moore Jul. 1979 132 p refs
(Contract N00014-76-C-1105)
(AD-A077814; RSL-TR-331-13) Avail: NTIS HC A07/MF A01 CSCL 08/12

The purpose of this paper is to describe the design and development of the University of Kansas helicopter-borne scatterometer system, HELOSCAT. The experiments performed to measure the radar backscatter from sea ice with this system along with the results are also described. Backscatter measurements were made at 1-2 GHz and 8-18 GHz frequencies, HH-polarization, and three incidence angles (20, 40, and 60 deg). Different types of ice ranging from thin ice to multiyear ice were observed; however, most data were collected from thick first-year and multiyear ice. A comparison of 1-2 GHz results for thick first-year and multiyear ice shows that the scattering coefficient values for multiyear ice at 60 deg are slightly lower than the value for thick first-year ice. The 8-18 GHz results show that the backscatter from multiyear ice at these frequencies is higher than the backscatter return from thick first-year ice by at least 3-4 dB. The frequency response of backscatter return is an upward sloping straight line on a dB-vs-frequency plot. For the multiyear ice, only the 60 deg data was found usable; the data at 20 deg and 40 deg were determined to be erroneous because of a malfunctioning frequency counter. GRA

REMOTE MEASUREMENTS OF BOUNDARY LAYER VELOCITY PARAMETERS BY MONOSTATIC LIDAR

Jeffery Thomas Sroga Oct. 1979 132 p refs
(Contract DAAG29-76-C-0136; DA Proj. 1T1-61102-GH-37)
(AD-A078678; ERADCOM/ASL-CR-79-0136-1) Avail: NTIS
HC A07/MF A01 CSCL 17/8

Wind velocity parameters in the planetary boundary layer are measured using spatial inhomogeneities in the natural aerosol content as tracers. Lidar measurements of these spatial inhomogeneities are correlated in time and space to remotely estimate the mean speed, direction and the rms speed variance of the wind velocity. Aerosol inhomogeneities with horizontal dimensions of 60m-0.1km were found to be efficient tracers of the wind. The coherence between spatially and temporally separated lidar profiles of these spatial aerosol inhomogeneities is used to determine the perpendicular components along and across the beam pattern of the horizontal wind velocity. Comparisons between lidar horizontal wind measurements with tower anemometers and pilot balloons show that lidar can remotely sense the boundary layer flow. GRA

REMOTE SENSING OF OCEAN SURFACE CURRENT AND CURRENT SHEAR BY HF BACKSCATTER RADAR
Eng-Chong Ha Aug. 1978 141 p refs
(Contract N00014-75-C-0356)
(AD-A078834; SU-SEL-79-022; SU-TR-D415-1) Avail: NTIS
HC A07/MF A01 CSCL 17/9

The Doppler spectrum of radar return from the sea at HF contains two narrow lines displaced upward and downward from the carrier frequency, resulting from backscatter off ocean surface waves moving toward and away from the radar, respectively. These Bragg lines indicate resonant backscatter which occurs for the ocean waves of length one-half the radio wavelength. The phase velocity of these gravity waves consists of two components; the first is determined by the wavelength and the second by the current component in the direction of wave propagation averaged over depth with an exponential weighting function that has a characteristic scale proportional to the wavelength. The Doppler shift of the radar carrier is determined by the wave phase velocity. Its variation with carrier frequency is thus related to the vertical profile of the current component in the radar direction by a Laplace transform; therein lies the principle of radio measurement of ocean current and its vertical shear. Radio backscatter experiments to verify the feasibility of such measurements were conducted using the radar operating at four frequencies covering the range from 3 to 30 MHz. The depth-averaged radial current deduced from the centroid of the Doppler-shifted sea echo experiments at 6.8, 13.3, 21.7, and 29.8 MHz showed fluctuations on the order of 1 cm/sec superimposed on temporal trends that reached maximum values of about 40 cm/sec. It is concluded that multifrequency backscatter ground-wave radar at HF constitutes a powerful technique for mapping current and its vertical profile in the top few meters of the ocean. GRA

USE OF SATELLITE IMAGERY FOR THE DERIVATION OF THE HYDROGEOLOGIC CHARACTERISTICS OF A TEST AREA IN SEMIARID CLIMATES
Carlo Vaccari (Italeco SpA) and Bruno Marcolongo 29 May 1979 12 p Presented at COSPAR Water Resources Symp., Bangalore, India, 30 May - 1 Jun. 1979
Avail: NTIS HC A02/MF A01

The ability to identify locations of underwater storage is especially important in semiarid areas. To this effect, the application of remote sensing by LANDSAT can lead to the identification of potential sites suitable for further ground exploration, thus curtailing the time, labor, and expense of alternative prospecting procedures. The method described utilizes the radiometric information supplied by LANDSAT, together with existing and readily available ground information, to reconstruct the major hydrogeologic features of a semiarid area and to assess in semiquantitative fashion its potential subsurface water content. (PB-300723/4; BM-OFR-124-79) Avail: NTIS
HC A06/MF A01 CSCL 08I

The possible transfer of U.S. and other developed country deep ocean mining (DOM) technologies to developing countries is one of several major issues in current United Nations Law of the Seas negotiations. A critique of the various terms and conditions pertaining to technology transfer in recent negotiating tests is presented. The relevant DOM technology, sources of innovation, and methods of proprietary protection are described. Functional requirements for viable technology transfer are developed and used as a basis for the definition of alternative levels of programs and implementation approaches, including required changes in the negotiating text. The consequences of these technology transfer options on the various parties are investigated. GRA

(NASA-CR-162463; PB-301417/2; JPL-662-101;
NOAA-79090406) Avail: NTIS HC A03/MF A01 CSCL 08J

Results are presented of an initial evaluation of part of the 105-day Seasat mission, focusing on data obtained from a 30 day experiment conducted in the Gulf of Alaska during August-September 1978. The Gulf of Alaska Seasat Experiment (GOASEX) was the only dedicated surface observation program conducted to validate the satellite data. Initial quantitative Seasat results produced during a Workshop held on January 22-26, 1979 are reported. Based on an early evaluation of these results, it is concluded that some of the original objectives of sensor performance were met. GRA

A method characterized by the steps of positioning a plurality of uniformly dimensioned photovoltaic cells in registered relation with a plurality of openings formed in a planar tool is disclosed. The method allows acess to the P contact surface of each of the cells. The steps of the method are: (1) connecting the N contact surface of alternate cells to the P contact surface of the cells interposed therebetween, (2) removing therefrom residue of solder flux, (3) applying to the N contact surfaces of the cells a transparent adhesive, (4) placing a common transparent cover plate in engaged relation with the adhesive, (5) placing a film over the circular openings for hermetically sealing the openings, and (6) establishing a vacuum between the film and the cover plate.

DRIVER FOR SOLAR CELL I-V CHARACTERISTIC PLOTS Patent
Gary B. Turner, inventor (to NASA) (JPL) Issued 15 Jan. 1980 6 p Filed 26 Jul. 1978 Supersedes N78-28625 (16 - 19, p 2557) Sponsored by NASA
(NASA-Case-NPO-14096-1; US-Patent-4,184,111; US-Patent-Appl-SN-928128; US-Patent-Class-324-404; US-Patent-Class-324-158D) Avail: U.S. Patent and Trademark Office CSCL 10A

A bipolar voltage ramp generator which applies a linear voltage through a resistor to a solar cell for plotting its current versus voltage (I-V) characteristic between short circuit and open circuit conditions is disclosed. The generator has automatic stops at the end points. The resistor serves the multiple purpose of providing a current sensing resistor, setting the full-scale current value, and providing a load line with a slope approximately equal to one, such that it will pass through the origin and the approximate center of the I-V curve with about equal distance from that center to each of the end points.

SOLAR CELL ANGULAR POSITION TRANSDUCER Patent
Maynard C. Sandford and David L. Gray, inventors (to NASA) Issued 15 Jan. 1980 8 p Filed 9 Feb. 1978 Supersedes N78-18394 (16 - 09, p 1160)
(NASA-Case-LAR-11999-1; US-Patent-4,184,072; US-Patent-Appl-SN-876299; US-Patent-Class-250-231SE; US-Patent-Class-250-211K) Avail: U.S. Patent and Trademark Office CSCL 10A

An angular position transducer utilizing photocells and a light source is disclosed. The device uses a fully rotatable baffle which is connected via an actuator shaft to the body whose rotational displacement is to be measured. The baffle blocks the light path between the light source and the photocells so that a constant semicircular beam of light reaches the photocells. The current produced by the photocells is fed through a resistor, a differential amplifier measures the voltage drop across the resistor which indicates the angular position of the actuator shaft and hence of the object.

ANALYSIS OF THE GEOTHERMAL BINARY CYCLE USING PARAFFIN HYDROCARBONS AS WORKING FLUIDS Ph.D. Thesis
Khan Zafar Iqbal 1979 301 p
Avail: Univ. Microfilms Order No. 8004390

It is demonstrated that the analysis of the geothermal binary cycles is simplified through the use of basic thermodynamic relations. The complex interrelationships of thermodynamic, equipment, unit operational, and cost parameters are presented. It is shown that mixtures provide a significantly greater amount of work compared to pure fluids. Furthermore, mixture composition and behavior can be changed over the plant lifetime to match the changes in the geothermal resource. For fixed brine flow rate conditions, a decrease in the resource temperature results in a decrease in the net plant power. For the 300 F georesource temperature, the resource utilization and cost optima nearly coincide. Dissert. Abstr

DEVELOPMENT OF IMPROVED WRAPAROUND CONTACTS FOR SILICON Final Report
Jay W. Thornhill Dec. 1979 41 p
(Contract NAS3-20065)
(NASA-CR-159748) Avail: NTIS HC A03/MF A01 CSCL 10A

A developmental process for fabricating 2 X 4 cm back surface field silicon solar cells featuring wraparound contacts and screen printed dielectric isolation is described. The process was then used to fabricate a number of cells for evaluation and study, as well as to establish the validity of the process sequence. While a number of cells exhibiting relatively good conversion efficiencies were produced, nearly all had low I-V curve factors for the level of efficiencies attained. Cells with conversion efficiencies of more than 15 percent (air mass zero and 25 C) had fill factors of only 0.76. Evidence as to the cause of this has not been conclusive, but is most probably linked to isolation failure in the wraparound dielectric and associated shunting problems. Author

FLEXIBLE FORMULATED PLASTIC SEPARATORS FOR ALKALINE BATTERIES Patent Application
D. W. Scheibley, J. M. Bozek, and D. G. Soltis, inventors (to NASA) Filed 28 Sep. 1979 10 p
(NASA-Case-LEW-12363-4; US-Patent-Appl-SN-079914) Avail: NTIS HC A02/MF A01 CSCL 10C

A flexible separator for alkaline batteries is disclosed. The separator is comprised of a coating which is applied to a nonwoven porous substrate such as sheets or mats of asbestos or other materials which are inert with respect to the alkaline electrolyte of the battery. The coating material comprises a polyphenylene oxide polymer, an organic additive and inorganic and organic fillers which comprise 55% by volume or less of the coating material. Preferably, at least one inorganic filler material which is reactive with the electrolyte is included to produce desirable pores in the coating. The organic additive is a polymeric polyester material which is hydrolyzed by the alkaline electrolyte to improve conductivity of the coating. NASA

CATALYST SURFACES FOR THE CHROMOUS/CHROMIC REDOX COUPLE Patent Application
Jose D. Giner (Giner, Inc.) and Kathleen J. Cahill, inventors (to NASA) (Giner, Inc.) Filed 27 Jul. 1979 15 p Sponsored by NASA
(NASA-Case-Lew-13148-2; US-Patent-Appl-SN-061555) Avail: NTIS HC A02/MF A01 CSCL 10A

An electricity producing cell of the reduction-oxidation type is disclosed. The cell is divided into two compartments by a membrane and each compartment contains a solid inert electrode. A ferrous/ferric couple in a chloride solution serves as a cathode fluid which is circulated through one of the compartments to produce a positive electric potential disposed therein. A chromic/chromous couple in a chloride solution serves as an anode fluid which is circulated through the second compartment to produce a negative potential on an electrode disposed therein. The electrode is an electrically conductive, inert material plated with copper, silver or gold. A thin layer of lead plates onto the copper, silver or gold layer when the cell is being charged, the lead ions being available from lead chloride which has been added to the anode fluid. If the REDOX cell is then discharged, the current flows between the electrodes causing the lead to deplate from the negative electrode and the metal coating on the electrode will act as a catalyst to cause increased current density. CONTROL STRATEGY FOR A VARIABLE-SPEED WIND ENERGY CONVERSION SYSTEM
A. Jacob, D. Veillette, and V. Rajagopalan Nov. 1979 10 p refs Transl. into ENGLISH from Proc. of New York Inst. of Elec. Engineers Inc., 1978 p 528-531 In FRENCH Presented at Can. Commun. and Power Conf., Montreal, 18-20 Oct. 1978 Transl. by Kanner (Leo) Associates, Redwood City, Calif.
(Contract NASw-3199)
(NASA-TM-75512) Avail: NTIS HC A02/MF A01 CSCL 10A

A control concept for a variable-speed wind energy conversion system is proposed, for which a self-exited asynchronous cage generator is used along with a system of thyristor converters. The control loops are the following: (1) regulation of the entrainment speed as function of available mechanical energy by acting on the resistance couple of the asynchronous generator; (2) control of electric power delivered to the asynchronous machine, functioning as a motor, for start-up of the vertical axis wind converter; and (3) limitation of the slip value, and by consequence, of the induction currents in the presence of sudden variations of input parameters. PARAMETRIC STUDY OF POTENTIAL EARLY COMMERCIAL MHD POWER PLANTS Final Report
Finn A. Hals Dec. 1979 246 p refs
(Contracts DEN3-51; EF-77-A-01-2674)
(NASA-CR-159633; DOE/NASA/0051-79/1) Avail: NTIS HC A11/MF A01 CSCL 10B

Three different reference power plant configurations were considered with parametric variations of the various design parameters for each plant. Two of the reference plant designs were based on the use of high temperature regenerative air preheaters separately fired by a low Btu gas produced from a coal gasifier which was integrated with the power plant. The third reference plant design was based on the use of oxygen enriched combustion air preheated to a more moderate temperature in a tubular type metallic recuperative heat exchanger which is part of the bottoming plant heat recovery system. Comparative information was developed on plant performance and economics. The highest net plant efficiency of about 45 percent was attained by the reference plant design with the use of a high temperature air preheater separately fired with the advanced entrained bed gasifier. The use of oxygen enrichment of the combustion air yielded the lowest cost of generating electricity at a slightly lower plant efficiency. Both of these two reference plant designs are identified as potentially attractive for early MHD power plant applications. R.E.S.

SPS PILOT SIGNAL DESIGN AND POWER TRANSPONDER ANALYSIS, VOLUME 2, PHASE 3 Final Report
W. C. Lindsey, R. A. Scholtz, and C. M. Chie Jan. 1980 108 p refs
(Contract NAS9-15782)
(NASA-CR-160537; TR-0180-0779-Vol-2-Phase-3) Avail: NTIS HC A06/MF A01 CSCL 10B

The problem of pilot signal parameter optimization and the related problem of power transponder performance analysis for the Solar Power Satellite reference phase control system are addressed. Signal and interference models were established to enable specifications of the front end filters including both the notch filter and the antenna frequency response. A simulation program package was developed to be included in SOLARSIM to perform tradeoffs of system parameters based on minimizing the phase error for the pilot phase extraction. An analytical model that characterizes the overall power transponder operation was developed. From this model, the effects of different phase noise disturbance sources that contribute to phase variations at the output of the power transponders were studied and quantified. Results indicate that it is feasible to hold the antenna array phase error to less than one degree per power module for the type of disturbances modeled. R.E.S.

ACTIVE HEAT EXCHANGE SYSTEM DEVELOPMENT FOR LATENT HEAT THERMAL ENERGY STORAGE Topical Report, Jun. 1978 - Feb. 1979
Joseph Alario, Robert Kosson, and Robert Haslett Jan. 1980 73 p refs
(Contracts DEN3-39; EC-77-A-31-1034)
(NASA-CR-159726; DOE/NASA/0039-79/1;
GAC-TR-1681-09) Avail: NTIS HC A04/MF A01 CSCL 10A

Various active heat exchange concepts were identified from among three generic categories: scrapers, agitators/vibrators and slurries. The more practical ones were given a more detailed technical evaluation and an economic comparison with a passive tube-shell design for a reference application (300 MW sub t storage for 6 hours). Two concepts were selected for hardware development: (1) a direct contact heat exchanger in which molten salt droplets are injected into a cooler counterflowing stream of liquid metal carrier fluid, and (2) a rotating drum scraper in which molten salt is sprayed onto the circumference of a rotating drum, which contains the fluid salt is sprayed onto

the circumference of a rotating drum, which contains the fluid heat sink in an internal annulus near the surface. A fixed scraper blade removes the solidified salt from the surface which was nickel plated to decrease adhesion forces. In addition to improving performance by providing a nearly constant transfer rate during discharge, these active heat exchanger concepts were estimated to cost at least 25% less than the passive tube-shell design. R.E.S.

ENGINEERING EVALUATION OF A SODIUM HYDROXIDE THERMAL ENERGY STORAGE MODULE Final Report
Donald G. Perdue and Larry H. Gordon Feb. 1980 22 p refs
(Contract EC-77-A-31-1034)
(NASA-TM-81417; DOE/NASA/1034-80/7; E-338) Avail: NTIS HC A02/MF A01 CSCL 10A

An engineering evaluation of thermal energy storage prototypes was performed in order to assess the development status of latent heat storage media. The testing and the evaluation of a prototype sodium hydroxide module is described. This module stored off-peak electrical energy as heat for later conversion to domestic hot water needs. R.E.S.

N80-18564*# National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.
OVERVIEW OF A STIRLING ENGINE TEST PROJECT
Jack G. Slaby 1980 27 p refs Proposed for presentation at 5th Intern. Automotive Propulsion Systems Symp., Dearborn, Mich., 14-18 Apr. 1980
(Contract EC-77-A-31-1040)
(NASA-TM-81442; DOE/NASA/1040-80/12; E-362) Avail: NTIS HC A03/MF A01 CSCL 10B

Tests were conducted on three Stirling engines ranging in size from 1.33 to 53 horsepower (1 to 40 kW). The tests were directed toward developing alternative, backup component concepts to improve engine efficiency and performance or to reduce costs. Some of the activities included investigating attractive concepts and materials for cooler-regenerator units, installing a jet impingement device on a Stirling engine to determine its potential for improved engine performance, and presenting performance maps for initial characterization of Stirling engines. The experiment results of the tests are presented along with predictions of results of future tests to be conducted on the Stirling engines. R.E.S.

SOLAR ENERGY DESIGN IMPROVEMENT: A METHODOLOGY FOR HYDRONIC FLATPLATE COLLECTOR SYSTEMS M.S. Thesis
Lawrence William Kozoyed Sep. 1979 236 p refs
(AD-A076836) Avail: NTIS HC A11/MF A01 CSCL 03/2

A methodology for solar energy system design improvement has been developed and coupled with a constrained function optimization code resulting in an automated solar energy system design procedure. The scope of the methodology is limited to systems using flat plate collectors and water as the working fluid. Eight parameters have been included as independent design variables. The design variables included collector area, collector tile angle, collector and storage fluid stream velocities, and collector to storage heat exchanger dimensions. The procedure includes an accounting for economic parameters as an intimate part of the design process. The resulting methodology has been used for the design of solar energy systems which would use shelf item collectors for the purpose of determining the optimum design variable vector for a given situation. The methodology could also be used on a limited basis for collector design optimization by exploring the effects of changing selected collector parmeters on system performance. The methodolgoy is coded in the FORTRAN computer language under the name SOLOAD-1 (Solar Energy Optimization Analysis or Design). GRA

A FEASIBILITY STUDY OF WINDPOWER FOR THE NEW ENGLAND AREA Final Report, 4 Jun. - 31 Oct. 1979
Patrick Martin, Michael Balma, Gwen Crooks, Roy Endlich, and Christopher Maxwell Oct. 1979 238 p refs
(Contract N00014-79-C-0539; SRI Proj. 8569)
(AD-A076614) Avail: NTIS HC A11/MF A01 CSCL 05/3

SRI International examined the applicability of large-scale windpower electricity generating systems (WEGS) as an alternative source of energy for the New England States in general and for the U.S. Navy Portsmouth Shipyard at Kittery, Maine, in particular. The Boeing Mod 2 wind machine was selected as representative of current technology in the appropriate size range of 2.5 megawatts (MW) rated capacity. Parametric economic analyses led to the conclusion that WEGS electricity can be at economic parity with the incremental electricity from conventional generators using oil or gas without any allowance for a capacity credit, provided that the annual utilization factor for the WEGS is at least 50%. Such utilization appears to be achievable at elevations between 620 and 1,240 m (2,000 and 3,000 ft). About one-eight of the 35,500 sq kilometers of air space reviewed in New Hampshire is at such elevations. Nonutility financing and capitalization can halve the costs of WEGS electricity. Nonutility ownership of WEGS is encouraged by recent state and federal legislation. The primary potential WEGS environmental impact, interference with television reception, can be mitigated by installation of cable TV service. GRA

SAFETY STUDIES OF LITHIUM-SULFUR DIOXIDE CELLS Final Report, 25 Apr. - 27 Oct. 1978
L. J. Blagdon and B. Randall Ft. Monmonth, N.J. ERADCOM Nov. 1979 117 p refs
(Contract DAAB07-78-C-0530; DA Proj. 1F2-63702-DG-10)
(AD-A078961; DELET-TR-78-0530-F) Avail: NTIS HC A06/MF A01 CSCL 09/1

Hermetically sealed sulfur dioxide 'D' cells were fabricated and tested to improve safety during use/abuse conditions. Cathodes and anodes were optimized to yield efficient and safe operation at -20 F. Explosions were eliminated and venting was minimized when the cells were discharged at 2A constant current to 200% of the theoretical SO2 content between -20 F and +130 F. Discharge currents at 3.5A and above resulted in frequent but safe venting. GRA

AROMATIC IONS AS ANODE MATERIALS FOR RECHARGEABLE, AMBIENT-TEMPERATURE BATTERIES Final Report
Stanley D. James Mar. 1979 28 p refs
(ZR0130101)
(AD-A078697; NSWC/TR-79-295) Avail: NTIS HC A03/MF A01 CSCL 10/3

The use of aromatic radical ions is proposed as anode material for high energy density, ambient-temperature and secondary batteries. Preliminary data are promising, showing that the naphthalenide anion can provide high current-densities at practical current-collectors like steel and nickel. However, the present test-electrode design did not confine naphthalene long enough to demonstrate rechargeability over a number of cycles. Two approaches are recommended to containing the aromatics close to a current-collector for extended periods of charge-discharge cycling. GRA

HIGH RATE STABLE NICKEL-CADMIUM BATTERIES Final Report, Jun. 1975 - May 1979
James M. Hill Aug. 1979 69 p refs
(Contract DAAB07-75-C-1770)
(AD-A078714; DELET-TR-75-1770-F) Avail: NTIS HC A04/MF A01 CSCL 10/3

The report describes work for the design, construction, and testing of advanced state-of-the-art high rate stable vented nickel-cadmium batteries, with a special emphasis on the improvement of the separator wrap. Eagle-Picher Industries, Inc. designed and tested three to five cell units (BB-600 cells) of the BB-433 aircraft battery during phase I of this contract for the purpose of determining and selecting an optimum design. Phase II, the second half of the contract, included the design, fabrication and testing of 24 volt, 35 ampere-hour batteries of the BB-433 configuration, utilizing the optimum design features of Phase I. The batteries and the three to five cell units were tested in accordance with the updated Technical Guidelines for High Rate Stable Nickel-Cadmium Batteries. GRA

SAFETY STUDIES OF LITHIUM-SULFUR DIOXIDE CELLS Final Report, 11 May - 10 Dec. 1978
A. N. Dey and P. Witalis Nov. 1979 66 p refs
(Contract DAAB07-78-C-0535; DA Proj. 1F2-63702-D-610)
(AD-A077277; DELET-TR-78-0535-F) Avail: NTIS HC A04/MF A01 CSCL 10/3

The objective of this program was to study the relationship between the various design parameters of Li/SO2 cells and their abuse resistance for the purpose of developing approaches to the design of cells with an increased abuse resistance. The investigations were focussed on hermetically sealed D cells. Three factors were found to affect the abuse resistance of the cells significantly: (1) the Li/SO2 ratio, (2) the anode/cathode capacity ratio, and (3) the intrinsic rate capability of the cathode. Cells incorporating the most favorable combination of these factors were found to have a significantly greater abuse resistance than the standard production cells as determined by the behavior of the cells under constant current cell reversal at various discharge rates. The experimental work showed that for any particular cell design abusive conditions can be found that render the cells unsafe. It also showed that the abuse resistance of the cells can be even further increased by the development of truly high rate cathode structures and electrode configurations, so much so that in all probability the cells may be rendered safe under all conditions encountered in field use and storage. GRA

(AD-A077162; DELET-TR-78-0563-3; QR-3) Avail: NTIS HC A04/MF A01 CSCL 10/3

The Li/SOCl2 inorganic electrolyte system is the highest energy density system known to date. It consists of a Li anode, a carbon cathode and SOCl2 which acts both as a solvent and as a cathode active material. The electrolyte salt that has been used most extensively is LiAlCl4, but salts such as Li2B10Cl10 and Li2O(AlCl3)2 have also been used successfully in this system for improving the shelf life characteristics. The main objective of this program is to develop high rate Li/SOCl2 cells and batteries for portable applications of the U.S. Army. The cells and batteries must deliver more high energy densities than are presently available and must be safe to handle under U.S. Army field conditions. GRA

(Contract F33615-77-C-2020; AF Proj. 3145)
(AD-A077685; AFAPL-TR-79-2044) Avail: NTIS HC A05/MF A01 CSCL 10/3

The objectives of this program are based on the desire to develop a calcium/oxyhalide system comparable to the lithium/oxyhalide system with respect to energy density and rate capabilities, while overcoming the problems of voltage delay and safety hazards. This project is directed toward assessing basic performance, safety, storage, and voltage delay of the calcium/oxyhalide system for use in Air Force applications. Early small cell development is designed for use in life support, rescue equipment, and spacecraft power, while Phase II development of large cells up to 10,000 Ampere hours is anticipated for use in missile standby and emergency ground power systems. Specific factors of concern in these applications are low volume, performance over a temperature range -40 F to 165 F, safety, and long shelf life. GRA

The optimization of LiAl/NaAlCl4/CuCl2 single thermal cells

is presented. Energy densities were obtained over the temperature range 175-275 degrees C and current density range 15-150 mA/square centimeters. The results were compared to similar data for LiAl/NaAlCl4/MoCl5 and LiAl/NaAlCl4/FeCl3 cells. Although the CuCl2 type cell had a lower voltage than the other types, its energy density was higher due to the extended lifetimes of these cells. GRA

REPORT ON THE GAS SUPPLY INDUSTRY
G. Alexander, R. Armson, M. Barrett, D. Casper, P. Chapman, D. Crabbe, G. Gravelle, D. Hemming, D. Herd, S. Johnson et al
Mar. 1979 212 p refs
(ERG-027) Avail: NTIS HC A10/MF A01; Secretary, Energy Res. Group, Milton Keynes, England

The evolution of the natural gas industry in the UK is reviewed, then an assessment of its operations in the foreseeable future is made. Its rapidly growing significance in the formulation of UK energy policy is emphasized, especially in regard to decisions in the development of nuclear energy. The impact on the UK coal industry is also shown and the relevance to planning for substitute natural gas production is pointed out. Pricing issues are covered as well. Supporting data presented include gas industry statistics on supply and demand, fuel price statistics, gas appliance statistics, and a load curve analysis used to foresee the possibility of a gas supply shortfall. EVALUATION OF A PHOTOCHEMICAL SYSTEM FOR NITROGEN OXIDES CONTROL Ph.D. Thesis
John Randolph Richards 1979 199 p
Avail: Univ. Microfilms Order No. 8005069

The technical feasibility of a photochemical pretreatment system for NOx control at coal fired boilers was evaluated. This approach utilizes reaction mechanisms similar to those responsible for photochemical oxidant incidents. The reactions are initiated under controlled conditions while the pollutants are at high concentration and while the reaction products can be removed. Results indicate that under time limited and light limited conditions, it is possible to quench the photochemical reactions at the NO2 peak and prior to the formation of ozone, aerosols, and other secondary products. However, the photochemical system will not be commercially competitive unless serious operational problems limit the alternative techniques or unless the photochemical system can be refined to reduce cost. Dissert. Abstr.

ENSEMBLE TRAJECTORY ANALYSIS OF SUMMERTIME SULFATE AEROSOL CONCENTRATIONS IN THE NORTHEASTERN UNITED STATES Ph.D. Thesis
Perry James Samson 1979 164 p
Avail: Univ. Microfilms Order No. 7928667

A technique for quantifying the relationships between observed concentrations of atmospheric sulfate aerosol and their corresponding upstream history of sulfur dioxide emissions, wind speed, and mixing height is presented. Using reported sulfate concentrations from several sampling sites, 72 h upstream trajectories are computed for the mixed-layer of the atmosphere over the duration of their respective sampling periods. It is found that the sulfate concentrations were insensitive to upstream mixing height, highly correlated with the inverse of wind speed occurring at times greater than 24 h upstream of the sampling point, and totally in response to the spatial configuration of sources around the sampling point. The resultant sulfate concentrations were not always correlated with the total upstream emissions burdens of sulfur dioxide. The implications of these results to possible emission control strategies for sulfur dioxide to reduce the regional episodes of high sulfate concentrations are discussed and future work using this technique is outlined. Dissert. Abstr.

ON THE FUTURE AVERAGE MERCURY CONTENT OF AIR, SOIL AND RIVER SEDIMENTS IN THE EUROPEAN ECONOMIC COMMUNITY AND IN THE WORLD'S OCEANS
R. H. vanEnk 1978 56 p refs
(EUR-6023; ISBN-92-825-0529-4; CD-NO-78-013-EN-C) Copyright. Avail: Issuing Activity

A computerized simulation of the pathways of mercury through the environment was used to estimate the average mercury concentration levels in the atmosphere, soil, and river sediments in the EEC as a function of time. In an extended model the impact of the total mercury released throughout the world on

the average mercury content of ocean water as a function of time was investigated. It was shown that the tendency of the average mercury content levels to increase rapidly in the EEC is arrested. No significant increase of average mercury content of ocean water is expected. Author (ESA)

(NASA-CR-159781; ORI-TR-1686) Avail: NTIS HC A05/MF A01 CSCL 13B

Performance deficiencies in aerial liquid and dry dispersal systems are identified. Five control system concepts are explored: (1) end of field on/off control; (2) manual control of particle size and application rate from the aircraft; (3) manual control of deposit rate on the field; (4) automatic alarm and shut-off control; and (5) fully automatic control. Operational aspects of the concepts and specifications for improved control configurations are discussed in detail. A research plan to provide the technology needed to develop the proposed improvements is presented along with a flight program to verify the benefits achieved. K.L.

CONTROL OF PARTICULATE EMISSIONS FROM TURBINE ENGINE TEST CELLS BY COOLING WATER INJECTION Final Report, Feb. - May 1979
Michael G. MacNaughton, James J. Tarquinio, and Joseph A. Martone Jul. 1979 77 p
(AF Proj. 1900)
(AD-A075947; AFESC/ESL/TR-79-19) Avail: NTIS HC A05/MF A01 CSCL 13/2

The operation of DOD turbine engine test cells in California has been criticized by the State environmental regulatory agencies because smoke generated by some engines results in excessive opacity (visibility) of the test cell exhaust plume. Since the plume exceeds visibility standards for only a relatively small proportion of engines tested a low cost control technique which brings the test cell into compliance with opacity standards is required. This study was initiated to verify that, in addition to forming a steam plume, water used to cool the test cell walls also removes engine generated particulates and substantiates this procedure as a legitimate pollution control technique. It can be concluded from this study that water injection as practiced at McClellan AFB test cell results in significant (approx. 50% by weight) control of turbine engine particulate emissions. It is postulated that the process could be made more efficient by the use of better designed spray nozzles which would increase water droplet particle contact and inclusion of a demister to increase water removal from the exhaust. RELATIONSHIP OF ACOUSTIC EMISSION AND ULTRASONIC VELOCITY TO DEFORMATION MECHANISMS AND DILATANCY DURING THE DUCTILE DEFORMATION OF MARBLE Ph.D. Thesis
Theodore Allen Koelsch 1979 128 p
Avail: Univ. Microfilms Order No. 8004208

The effects of confining pressure and grain size on both the macroscopic and microscopic deformational behavior of triaxially deformed marble were investigated by the simultaneous measurement of acoustic emissions, sample dilatancy and ultrasonic velocity changes. Numerical spectral analysis was carried out by digitizing individual events with a transient recorder. The axial compressional velocity changes were determined to within 0.01 percent from the transit time of 1 MHz signals. The analysis of the acoustic signals revealed two major types of signals distinguishable by their main frequency and waveform. The important microscopic processes identified were: (1) intracrystalline twinning, (2) grain boundary rotation and sliding, (3) microfracture nucleation, and (4) microfracture propagation. The importance of twinning as an effective mechanism for microfracture nucleation was demonstrated. Dissert. Abstr.

THE NORTH PACIFIC OSCILLATION AND EIGENVECTORS OF NORTHERN HEMISPHERE ATMOSPHERIC CIRCULATION DURING WINTER Ph.D. Thesis
Jeffrey Charles Rogers 1979 186 p
Avail: Univ. Microfilms Order No. 8003010

A climatological study of the North Pacific Oscillation between 1906 and 1973, and a related analysis of the eigenvectors of Northern Hemisphere sea level pressure and 500 mb height departures for the winters 1946-47 through 1976-77 were performed. Two types of eigenvector analysis were carried out: the first was for mean winter pressure and height anomalies for the 31 winters and the second was for daily pressure and height departures during each individual winter. Eigenvector patterns based on daily data were compared between winters and also with the seasonal mean anomaly eigenvector patterns. Eigenvector patterns based upon unnormalized data appear to show real spatial variability in atmospheric anomaly fields whereas eigenvectors from normalized data are less useful. The associations between the time coefficients of the pressure and height eigenvector patterns are discussed. Dissert. Abstr.

N80-18592 New Mexico State Univ., University Park.
CONVECTION IN THE EARTH'S MANTLE DUE TO VISCOUS SHEAR AT THE CORE-MANTLE INTERFACE AND DUE TO LARGE SCALE BUOYANCY Ph.D. Thesis
Richard Guy Hills 1979 437 p
Avail: Univ. Microfilms Order No. 8002697

A three dimensional constant viscosity model for the mantle motions which are caused by viscous shear at the core mantle interface and by large scale buoyant forces is developed. The model utilizes geomagnetic data and magnetohydrodynamic theory to define an outermost core free stream velocity distribution. The resulting free stream velocity field is used in conjunction with the viscous boundary layer equations to find the corresponding stress field that the core exerts on the mantle. The resulting stress field acting on the inner mantle along with various passive

outer boundary conditions are used to find the corresponding three dimensional velocity field of the mantle. To account for large scale buoyant forces, the model uses a currently available three dimensional seismic velocity anomaly distribution for the mantle along with simple linear models relating seismic velocity anomaly to density perturbation. Dissert. Abstr.

COMPUTATION OF SYNTHETIC SEISMOGRAMS BY THE METHOD OF CHARACTERISTICS Ph.D. Thesis
Louis Reyes Castro 1979 65 p
Avail: Univ. Microfilms Order No. 8003211

The method of characteristics is applied to one-dimensional stress wave propagation problems of exploration interest. Several seismograms computed from dry, elastic, and viscoelastic near surface models are compared to data recorded by various types of receivers. The characteristics method is also used to obtain a solution to Biot's equations for wave propagation in saturated media. Synthetic seismograms are computed from various core and reservoir models saturated with different types of fluids. The computed seismograms are used to study the effect of variable reservoir conditions on a seismic wavelet. Dissert. Abstr.

N80-18594 Ohio State Univ., Columbus.
TROPOSPHERIC WATER VAPOR ABSORPTION IN THE INFRARED WINDOW REGIONS Ph.D. Thesis
Michael Eugene Thomas 1979 252 p
Avail: Univ. Microfilms Order No. 8001842

Attenuation of infrared radiation in the troposphere is dominated by water vapor absorption. Most past work on the spectroscopy of water vapor was on the analysis of the rotational and vibrational bands. As a result, a thorough listing of line positions, line strengths and halfwidths exists today. Because of the weak continuum absorption in the water vapor windows centered at 10 and 4 microns efforts to measure and model the continuum were as successful as efforts in the analysis of the bands. Yet a precise understanding of continuum absorption is important for long path energy transmission. The purpose of this study is to demonstrate the importance of far wing phenomena in characterizing H2O continuum absorption. A total line shape for water vapor-nitrogen interactions valid under tropospheric conditions is derived. The model is tested using a set of experimental room temperature H2O continuum measurements of high quality. Using this data base parameters of the far wing component of the total line shape are determined from near band experimental data. Dissert. Abstr.

N80-18595 Colorado Univ. at Boulder.
POSITIONS AND MOVEMENT OF VHF LIGHTNING SOURCES DETERMINED WITH MICROSECOND RESOLUTION BY INTERFEROMETRY Ph.D. Thesis
Craig Owen Hayenga 1979 222 p
Avail: Univ. Microfilms Order No. 8002981

The first positions and movement in azimuth and elevation of VHF lightning sources obtained with a 34 MHz swept lobe interferometer are presented. The positions are correlated in time with electric field measurements which provide identification of the various processes occurring during a lightning discharge. Data from several flashes are presented. The early or breakdown phase consists primarily of quasicontinuous VHF emission from a large number of linear sources moving rapidly approx. 10 to the 7th power m/s) over distances of approx. 100-1500 meters. The relative positions of these sources drift with a velocity approximately > 100,000 m/s. The temporal and spatial patterns of the observed 34 MHz radiation indicate that different processes generate VHF radiation than those that generate lower frequency lightning radio emission. The source of VHF lightning radiation is attributed to the acceleration of electrons in the small high field region at the tip of an advancing breakdown streamer. Dissert. Abstr.

N80-18596 Missouri Univ. - Columbia.
SPECTRAL ANALYSIS OF SYNOPTIC SCALE DISTURBANCES OVER THE MARSHALL ISLANDS REGION Ph.D. Thesis
Geoffrey Arthur Gordon 1979 121 p
Avail: Univ. Microfilms Order No. 8002364

A comprehensive spectral analysis of the Marshall Islands upper air data is presented. Upper air observations interpolated to a synoptic scale grid network are used in the analysis to examine the spatial variability of the spectral statistics. Variance spectra of geopotential height, virtual temperature, and specific volume are found to be dominated either by a diurnal component and/or by long period fluctuations. The average structure of the synoptic scale disturbances is determined from cross spectra between grid points and between levels in the vertical. The interstation coherences for the vertical motion are generally small. Cross spectra between the vertical and specific volume are used to estimate the eddy conversion of available potential energy to eddy kinetic energy. The low frequency components, periods greater than about 10 days, are largely responsible for the long term eddy conversion process. Dissert. Abstr.

N80-18597 Cornell Univ., Ithaca, N. Y.
ELECTRIC FIELDS IN THE LOW LATITUDE IONOSPHERE AND THEIR RELATIONSHIP TO MAGNETOSPHERIC AND INTERPLANETARY PHENOMENA Ph.D. Thesis
Gonzales Butron 1979 162 p
Avail: Univ. Microfilms Order No. 8003934

The low latitude extension of magnetospheric fields during magnetically disturbed periods was investigated through case studies of particular events. Simultaneous auroral and equatorial electric field data are used along with magnetic field data to study anomalous electric field patterns. During some substorms, accompanied by ring current activity, the worldwide equatorial zonal electric field component reversed from the normal pattern. In several cases the zonal equatorial electric field component was nearly identical in form to the zonal auroral component, indicating the close electrical coupling between these regions. Less certain, but equally intriguing, is the evidence presented for a close relationship between the zonal equatorial electric field and the time derivative of the ring current induced magnetic field. Dissert. Abstr.

N80-18598 Texas A&M Univ., College Station.
A STUDY OF THE VARIABILITY OF THUNDERSTORM ELECTRICAL EVENTS BASED ON VERY-LOW-FREQUENCY ELECTROMAGNETIC DATA Ph.D. Thesis
William Burns Freeman, Jr. 1979 181 p
Avail: Univ. Microfilms Order No. 8003129

The incidence of lightning discharge was estimated including areal and global statistics and monthly values over a regularly spaced grid that includes much of the Eastern Hemisphere. It is shown that the Southern Hemisphere tropics were higher in average incidence of discharge than the Northern Hemisphere tropics. The relationship between flash density and thunderstorm days were studied for the months of January, April, August, and November with a curvilinear regression analysis. The relationship varied by season. The large-scale causes of the variability of cloud-to-ground discharges (dependent variable) were also studied. Multiple linear regression was used with and without a logarithmic transformation of the dependent variable. The variability of cloud-to-ground discharges when significant lightning had occurred was emphasized. Dissert. Abstr.

AIRGLOW STUDIES ON THE IONOSPHERE DYNAMICS OVER LOW LATITUDE IN BRAZIL
J. H. A. Sobral, M. A. Abdu, and I. S. Batista Dec. 1979 20 p refs Revised

(INPE-1644-RPE/100-Rev) Avail: NTIS HC A02/MF A01

Certain features are presented of the ionosphere dynamics over Cachoeira Paulista, Brazil, based on recent photometric observations of OI 6300 A emission, and ionosonde data, both taken at that site. The photometer scanned the geomagnetic meridional plane in a zenith angle range of 75 S to 75 N. Remarkable wavelike structures in the airglow intensity were observed in the premidnight period, which propagate from north to south (poleward) at an average speed of about 240 (+ or -) 70 m/s, assuming the emitting layer to be at an altitude of 250 km. These disturbances had wavelength of a few hundred kilometers and were associated with spread F echoes in the ionograms. A discussion is made on the possible source of the poleward propagating airglow disturbances. It is argued that these are possible manifestations of the vertical propagation of plasma bubbles over the magnetic equator. M.M.M.

IMPLICATION OF Z VARIATIONS DURING A NEAR-MOON EQUATORIAL COUNTERELECTROJET ON 6 MARCH 1967, IN THE INDIAN ZONE

R. P. Kane Nov. 1979 19 p refs Revised

(INPE-1613-RPE/087-Rev) Avail: NTIS HC A02/MF A01

The daily variations of geomagnetic H, D, Z were studied for the average of five internationally quiet days of March 1967, as also for a particular day (March 6, 1967), when a spectacular near-noon counterelectrojet occurred, at Trivandrum (about 30 km south of the dip equator) and Kodaikanal and Annamalainagar (about 170 km and 290 km north of dip equator) in the Indian zone. For the average quiet days, the electrojet seemed to be centered near dip equator in the morning, but shifted steadily southward over Trivandrum and beyond by evening. For the near-noon counterelectrojet day, single current systems flowing more than hundred kilometers to the north of the dip equator and/or double current systems, one normal near the dip equator and another reverse, about hundred kilometers or more to the north were indicated. ANALYSES OF THE MIDDLE LATITUDE INSTABILITIES USING A QUASI-GEOSTROPHIC MODEL [ANALISE DA INSTABILIDADE DOS DISTURBIOS DE ESCALA MEDIA, USANDO UM MODELO QUASE GEOSTROFICO]

Nelson de Jesus Ferreira and V. B. Rao Oct. 1979 38 p refs In PORTUGUESE; ENGLISH summary Presented at the 31st Reuniao Anual da SBPC

(INPE-1592-RPE/079) Avail: NTIS HC A03/MF A01

Effects of latent heat of condensation on middle latitude disturbances are discussed, using a two layer quasi-geostrophic model. The main characteristics of instabilities, vertical structure and energy transformations of unstable disturbances are analyzed, using the classical method of eigen values. Results showed that the inclusion of latent heat does not change significantly the conventional baroclinic instability, but generate another class of disturbances, the so-called medium-scale disturbances. These disturbances have a characteristic wave length of approximately 1000 km. Author

A STUDY OF THE INFLUENCE OF OROGRAPHY AND DIFFERENTIAL ALBEDO ON THE ATMOSPHERIC CIRCULATION: AN APPLICATION TO THE BRAZILIAN NORTHEAST [UM ESTUDO SOBRE A INFLUENCIA DO ALBEDO DIFERENCIAL DA OROGRAFIA NA CIRCULACAO ATMOSFERICA: UMA APLICACAO PARA O NORDESTE BRASILEIRO]

Manoel Francisco Gomes Filho Nov. 1979 93 p refs In PORTUGUESE; ENGLISH summary

(INPE-1640-TDL/015) Avail: NTIS HC A05/MF A01

The influence of orography and differential albedo on the mean vertical motion in the atmosphere over Northeast Brazil was investigated. The vertical velocity is calculated at the top of the planetary boundary layer, using a vertically integrated atmospheric model, in which the zonal flow is laterally limited by rigid walls in the north and south, and vertically limited by a fixed lid. The mathematical model is similar to that of Berkofsky except that the equations are in the sigma coordinate system. The linearized equations are numerically resolved using a grid in which the variables are staggered in space and an Euler-backward time integration scheme. Considering the orography alone, sinking motions are induced over the region where the mean annual precipitation is a minimum. The same distribution of vertical motion results when the albedo alone is considered, which is in accord with the hypothesis of Charney. When both the orography and the albedo are incorporated in the model, the descending motion is found to be a greater intensity. As a result, it appears that the orography and the albedo together contribute to the low rainfall and arid conditions over Northeast Brazil. Author

WIND AND WAVE OBSERVATIONS IN THE MESOSPHERE USING COHERENT-SCATTER RADAR

I. D. Countryman and S. A. Bowhill 1 Oct. 1979 148 p

(Grant NSF ATM-77-06787)

(UILU-ENG-79-2508; ISSN-0568-0581; Aeronomy-89) Avail: NTIS HC A07/MF A01

Measurements of backscattered signals from the mesosphere using the coherent scatter technique were reviewed. The observations periods were four 48 hour intervals covering 1977. The multiheight, multidirectional wind measurements indicate that short period (1 minute to 1 hour) vertical velocity oscillations are usually evanescent vertically although propagating, reflected (trapped) modes are observed. Short period horizontal velocity oscillations were not consistently strong enough to be measurable for the pointing directions used. Tidal period horizontal winds were variable in amplitude and do not match theoretical predictions regarding uniform growth with height. R.C.T.

STUDY OF THE STORM TIME FLUXES OF HEAVY IONS Final Report

[1978] 42 p refs

(Contract NASw-3112)

(NASA-CR-162826; LMSC-D673774) Avail: NTIS HC A03/MF A01 CSCL 04A

The characteristics of the storm time ring current ions in the energy range of 0.5 to 16 keV were investigated. Data were processed and analyzed from the energetic ion mass spectrometer aboard the S3-3 satellite. Results are used for planning and operating the ion mass spectrometer experiment on the ISEE spacecraft, for selecting and processing the ISEE ion data, and for planning and conducting coordinated satellite experiments in support of the International Magnetospheric Study (IMS). It is established from the S3-3 ion data that relatively large fluxes of energetic (keV) O(+) and H(+) ions are frequently flowing upward from the ionosphere along magnetic field lines in the polar auroral regions. Also, from investigations with the same instrument during the main phase of three moderate (D sub ST approximately 100) magnetic storms, it is found that the number density of O(+) ions in the ring current was comparable to H(+) ion density the range 0.5 to 15 keV. SPHERICAL HARMONIC ANALYSIS OF A SYNOPTIC CLIMATOLOGY GENERATED WITH A GLOBAL GENERAL CIRCULATION MODEL

Zaphiris D. Christidis and J. Spar Feb. 1980 50 p refs

(Grant NGR-33-016-086)

(NASA-CR-162804) Avail: NTIS HC A03/MF A01 CSCL 04A

Spherical harmonic analysis was used to analyze the observed climatological (C) fields of temperature at 850 mb, geopotential height at 500 mb, and sea level pressure. The spherical harmonic method was also applied to the corresponding 'model climatological' fields (M) generated by a general circulation model, the 'GISS climate model.' The climate model was initialized with observed data for the first of December 1976 at 00 GMT and allowed to generate five years of meteorological history. Monthly means of the above fields for the five years were computed and subjected to spherical harmonic analysis. It was found from the comparison of the spectral components of both sets, M and C, that the climate model generated reasonable 500 mb geopotential heights. The model temperature field at 850 mb exhibited a generally correct structure. However, the meridional temperature gradient was overestimated and overheating of the continents was observed in summer. A HIGH SPEED DIGITAL AUTOCORRELATOR AND ITS APPLICATION TO MESOSPHERIC WATER VAPOR DETECTION

P. T. Petruno and John J. Olivero Jul. 1979 125 p refs

(Grant DAAG29-78-G-0083; DA Proj. 1L1-61102-B5-3A)

(AD-A076018; ERADCOM/ASL-CR-79-0083-1) Avail: NTIS HC A06/MF A01 CSCL 04/1

The emission and absorption spectrum of stratospheric and mesospheric water vapor are to be detected and analyzed. In both cases the method of detection requires a 22 GHz radiometer, and the data analysis requires a high speed, high resolution spectral analyzer. The basic radiometer fundamentals are discussed here, then the various techniques of spectral analysis are considered, which include both digital and analog versions of filter banks and autocorrelators. A prototype 2 x 1 bit digital autocorrelator was then designed and constructed. The system was designed to operate at a sampling rate of up to 100 MHz, with a resolution dependent on the number of autocorrelation points used. The system was then interfaced to a Nova 1200 minicomputer for data accumulation and transfer of data to nine track magnetic tape for standard processing. An IBM 370 computer system was available for final data reduction and analysis. The final system was a 16 point autocorrelator, two points of which were constructed. Future goals include completing the 16 points and using the system for a ground based measurement of upper atmosphere water vapor. GRA

THE EFFECTS OF RELATIVE HUMIDITY ON ATMOSPHERIC AEROSOL EXTINCTION IN THE 3-5 MICROMETERS AND 8-15 MICROMETERS SPECTRAL REGIONS

W. G. Tam and C. Boily May 1979 26 p refs

(AD-A070159; DREV-R-4121/79) Avail: NTIS HC A03/MF A01 CSCL 04/1

The variation of the infrared aerosol extinction coefficient as a function of relative humidity is studied. This is based on a two component particle distribution model. The aerosol extinction coefficient increases by a factor of more than 10 throughout the 3-5 and 8-15 micrometers spectral regions as the relative humidity increases from 0.5 to 0.99. For high relative humidities, a region of lower extinction around 10-11 micrometers is noticed. GRA

A CORRELATION BETWEEN AURORAL KILOMETRIC RADIATION AND FIELD-ALIGNED CURRENTS Progress Report

James Lauor Green, Nicolaos A. Saflekos, Donald A. Gurnett, and Thomas A. Potemra May 1979 34 p refs Prepared in cooperation with APL, Johns Hopkins Univ., Laurel, Md.

(Contract NAS1-13129; Grant NGL-16-001-043; Contracts N00014-76-C-0016; N00017-72-C-4401)

(NASA-CR-162842; AD-A076413; Rept.-79-38) Avail: NTIS HC A03/MF A01 CSCL 04/1

Simultaneous observations of field-aligned currents (FAC) and auroral kilometric radiation (AKR) are compared from the polar orbiting satellites Triad and Hawkeye. The Triad observations were restricted to the evening-to-midnight local time sector (19 to 01 hours magnetic local time) in the northern hemisphere. This is the region where it is believed the most intense storms of AKR originate. The Hawkeye observations were restricted to when the satellite was in the AKR 'emission cone' in the Northern Hemisphere and at radial distances > or = 7 R(E) (Earth radii) to avoid local propagation cutoff effects. A (R/7 R(E))2 normalization to the power flux measurements of the kilometric radiation from Hawkeye is used to take into account the radial dependence of this radiation and to scale all intensity measurements such that they are independent of Hawkeye's position in the emission cone. Integrated field-aligned current intensities from Triad are determined from the observed transverse magnetic field disturbances. Statistically, there is a good correlation between the AKR intensity and the integrated current sheet intensity of field-aligned currents. It is found that as the intensity of auroral kilometric radiation increases so does the integrated auroral zone current sheet intensity increase. GRA

COMPUTER SIMULATION OF GRADIENT DRIFT INSTABILITY PROCESSES IN OPERATION AVEFRIA

B. E. McDonald, M. J. Keskinen, S. L. Ossakow, and S. T. Zalesak 15 Nov. 1979 39 p refs

(AD-A077688; NRL-MR-4112) Avail: NTIS HC A03/MF A01 CSCL 04/1

Numerically equations of motion are solved for the evolution of a one level, two dimensional F region ionospheric plasma cloud with five different ratios of cloud to background integrated Pedersen conductivity. The simulations show that (1) physically small clouds striate due to the gradient drift instability more rapidly than large clouds, and (2) there exists a minimum striation onset time as a function of the Pedersen conductivity ratio. Observation (1) is in agreement with the rapid striation development exhibited by the physically small Avefria barium cloud releases, relative to the large Secede or STRESS type releases. HC A03/MF A01 CSCL 04/1

There has been an enormous growth of interest in the properties of small particles and in the mechanisms by which they are formed. The research program undertaken in our laboratory was directed to a study of the fundamentals of nucleation about negative ions, with particular attention to an elucidation of the structure of small clusters, and the role of chemical bonding in establishing their stability. Using a new high pressure mass spectrometric technique, a systematic investigation of the bond energies and entropies of numerous ligand-negative ion complexes were determined. Concurrent theoretical work on the bonding of small complexes and ion-induced nucleation was also undertaken. The results have led to a more complete understanding of nucleation phenomena, and especially of the importance of cluster structure in the development of surfaces and in effecting phase transformations. In addition, the work has led to a clarification of some recent atmospheric observations reported in the literature.

A series of measurements of the properties of equatorial ionospheric irregularities were made at Kwajalein, M.I. in August 1977 and July-August 1978. These measurements, involved coordinated ground based and in-situ sensors. The ARPA Long-range Tracking and Instrumentation Radar (ALTAIR), obtained backscatter and transmission data during five nights in August 1977 and eight nights in July-August 1978. This report describes the ALTAIR data from the night of 11 August 1978 which yield direct quantitative measurements of 1 m and 3/8 m irregularities and of plasma depleted regions. These plasma depleted regions, previously predicted on the basis of theoretical speculation and in-situ data, appear to be associated with the decay phase and not the generative phase of the field aligned irregularities.

Eight instrumented sounding rockets were flown to investigate ionospheric parameters and to further the development of new instruments and measurements techniques for investigating such parameters. Particular emphasis has been placed upon development of instrumentation for electron dosing via large electron accelerators aboard the payloads and assessment of the effects of such dosing as manifested by ultraviolet, visible, and particularly, infrared emissions. Launches have been accomplished under a variety of ionospheric conditions ranging from the quiescent, undisturbed ionosphere through intense auroral conditions. This report describes the program of launches and instrumentation used to accomplish the measurements.

(RR0330242)
(AD-A078918; AD-E000342; NRL-MR-4087) Avail: NTIS
HC A03/MF A01 CSCL 04/1

A theory of auroral kilometric radiation due to the nonlinear interaction between negative energy electromagnetic waves and coherent EIC waves is developed. The theory predicts that such radiation produced must have X-mode polarization and must have a frequency just slightly below the Doppler-shifted beam cyclotron frequencies. The basic requirement for free space accessibility is the presence of high-energy beams and a density cavity of the type observed by Isis I measurements. It is predicted that a harmonic band structure in the kilometric radiation may be observable.

A satellite experiment has obtained nadir-viewing atmospheric radiance measurements in the 1100 to 2900 angstrom wavelength region from the polar orbiting satellite S3-4. This report describes the instrumentation, measurement techniques, and initial results. The observed emission is from airglow, solar scatter, and auroral regions. Spectral and spatial measurements previously unavailable have been made for the nitrogen Lyman-Birge-Hopfield emission, vacuum ultraviolet aurora, hydrogen geocorona, tropical ultraviolet airglow, twilight fluorescence nitric oxide spectrum, and night oxygen Herzberg band emission. Low values of the day and night background radiance values have been found; these values can be applied to improved missile detection techniques. Spatial resolution down to about one kilometer will enable possible variability to be sought. Observations were made in the period March to September 1978. Correlations with other geophysical factors such as solar flux, magnetic index, and seasonal variations will be made after the data base from the experiment is completed.

The VV deactivation rate of N2 by H2O is calculated using a hard core repulsive potential. The process is found to be dominated by near resonant VR processes with large changes in rotational motion, and the rate is critically dependent on the classical path chosen. In part 2, a nonperturbative model of H2O is used to calculate the effects of centrifugal distortion on absorption line intensities. The errors are less than 10 percent for weak as well as strong lines. The effects of collision broadening by N2 and O2 are presented using Anderson theory together with dipole transitions by the multimode model. GRA

GLOBAL FREQUENCY DISTRIBUTION OF EXOSPHERIC TEMPERATURE
Jack W. Slowey Jul. 1979 25 p refs
(Contract F19628-78-C-0126; AF Proj. 6690)
(AD-A077293; AFGL-TR-79-0143; SCIENTIFIC-1) Avail: NTIS HC A02/MF A01 CSCL 04/1

The distribution of exospheric temperature under all conditions of solar and geomagnetic activity and of spatial location was determined for two different models of the Earth's thermosphere and exosphere. The two models were the 1971 Jacchia model and the U.S. Standard Atmosphere Supplements, 1966. Data from the past 12 solar cycles were used to determine the contribution of solar activity to the distributions. The contribution of geomagnetic activity was based on the distribution of geomagnetic activity for solar cycle 20. The spatial contribution was determined by analysis of the diurnal variation in exospheric temperature as given by the particular model. The resulting distributions indicate a mean exospheric temperature of approximately 900 K for either model. GRA

CALIBRATION OF AN ULTRAVIOLET POLYCHROMATOR FOR ROCKETBORNE STUDIES OF AURORA
Margareta Malmort 8 Jan. 1979 53 p refs In SWEDISH; ENGLISH summary Prepared in Cooperation with International Meteorological Inst., Stockholm
(AP-19) Avail: NTIS HC A04/MF A01

A multichannel fixed wavelength spectrometer, i.e., polychromator, for the spectral interval 200 to 400 nm, was designed, constructed, and calibrated. The instrument is for the study of nitric oxide chemistry in an auroral arc illuminated by the Sun. The instrument is part of the rocket payload S-27 TWILIGHT. Emission features are observed on two channels, one fitted with a quartz cell containing NO, the other with an argon filled reference cell. The purpose is to obtain specifically high spectral selection for NO emissions. All channels have a bandwidth of roughly 4 nm and a sensitivity of about 10 counts/Rayleigh. The calibration procedure is presented together with the purpose of the experiment and a brief physical description of some relevant processes involved in auroral NO chemistry. Author (ESA)

THE ENERGY BUDGETS OF A DEVELOPING CYCLONE OVER THE EAST CHINA SEA DURING THE 1975 AIR MASS TRANSFORMATION EXPERIMENT Ph.D. Thesis
Ming-Ying Wei 1979 148 p
Avail: Univ. Microfilms Order No. 8003805

The available potential and kinetic energy budgets are evaluated for a developing cyclone over the East China Sea during the 1975 air mass transformation experiment. The computations are made in a quasi Lagrangian frame. The relationship between the cyclone development and the amount of energy supplied from the ocean during air mass modification is examined. Three components of the diabatic processes are considered. Both the stable and convective latent heat release are estimated; the latter is accomplished using Kuo's cumulus parameterization scheme. The sensible heat transferred from the ocean is computed by employing the bulk aerodynamic method. The radiational heating is estimated considering modeled cloud distributions. Dissert. Abstr.

N80-18628 Colorado Univ. at Boulder.
TEMPERATURE AND CIRCULATION ANOMALIES IN THE EASTERN CANADIAN ARCTIC, SUMMER 1946 - 1976 Ph.D. Thesis
Richard Alan Keen 1979 170 p
Avail: Univ. Microfilms Order No. 8002991

Baffin Island and nearby regions of the eastern Canadian Arctic have been the focus of many recent and ongoing paleoclimatic and glaciological studies. The region is very suitable for these studies because of the sensitivity of regional ice and snow conditions to small changes in summer temperature (which average a few degrees above freezing). Baffin Island's location beneath one of the major features of the general atmospheric circulation, a trough in the upper westerlies, raises the possibility that regional climate variations may be closely linked to changes in the global-scale climate and circulation. The existence of such a link would greatly enhance the importance of Baffin Island paleoclimatic and glaciological studies. The thirty summers (1946-76) of surface temperature and pressure, and upper air data for the Baffin region, the Arctic, and the extratropical Northern Hemisphere, are analyzed to establish the nature and significance of the regional global summer climate and circulation links. Dissert. Abstr.

N80-18629 Cornell Univ., Ithaca, N. Y.
NUMERICAL MODELING OF HIGH LATITUDE WINDS IN THE UPPER ATMOSPHERE Ph.D. Thesis
Antonio Eduardo Pereira 1979 98 p
Avail: Univ. Microfilms Order No. 8003974

The upper atmospheric electrically driven wind system was modeled to reproduce the characteristics of rocket measurements made in the afternoon auroral over Fairbanks. The plasma density and electric field in a geostationary frame of reference were obtained from the incoherent scatter radar station at Chatanika, Alaska. The model consists of the meteorological equations to which viscosity and forcing terms of electrical origin were added. The equations can be solved numerically by treating the advection terms with the Lax-Wendroff method and the viscous terms by a fully implicit method. The continuity equation does not need to be solved simultaneously with the momentum and energy equations. The dispersion associated with the Lax-Wendroff method can be controlled by using a grid spacing small in relation to the length scale for large changes in the electric field, plasma density, and other parameters. Dissert. Abstr.

THUNDERSTORM-ENVIRONMENT INTERACTIONS DETERMINED WITH THREE-DIMENSIONAL TRAJECTORIES Ph.D. Thesis
Gregory Sims Wilson 1979 166 p
Avail: Univ. Microfilms Order No. 8003197

Diagnostically determined three dimensional trajectories were used to reveal some of the scale interaction processes that occur between convective storms and their environment. Convective storm systems with good temporal and spatial continuity are shown to be related to the development and movement of short wave circulation systems aloft that propagate eastward within a zonal mid tropospheric wind pattern. These short wave systems are found to produce the potential instability and dynamic triggering needed for thunderstorm formation. The environmental flow patterns, relative to convective storm systems, are shown to produce large upward air parcel movements in excess of

50 mb/3h in the immediate vicinity of the storms. The thermo- and hydrodynamical processes that lead to changes in atmospheric structure before, during, and after convective storm formation are successfully described using total time derivatives of pressure or net vertical displacement (NVD), potential temperature, and vector wind calculated by following air parcels. The high degree of scale interaction between synoptic and convective scale systems is demonstrated statistically, using multiple linear regression, by combining NVD's and static stability measurements to successfully locate convective activity of various intensities over the AVE IV network. Dissert. Abstr.

HIGH-INTENSITY RAINFALL STATISTICS FOR CANADA
B. Segal Nov. 1979 130 p refs
(CRC-1329-E) Avail: NTIS HC A07/MF A01

Rainfall data for Canada are presented, and the potentially detrimental influence of the rainfall on microwave transmission is studied. The rainfall statistics across the entire country are examined and discussed in relation to the design and operation of radio and radar systems. The precipitation data base is reviewed including rain gauge calibration, rain gauge errors, and rain chart misalignment. The rainfall inhomogeneity and the temporal variability are discussed and precipitation modifying influences such as terrain effects and anthropogenic effects are reported. A.W.H.

THE RELATIONSHIP BETWEEN TOTAL PRECIPITABLE WATER AND SURFACE DEW POINT
Y. Viswanadham Oct. 1979 17 p refs Revised Submitted for publication
(INPE-1604-RPE/084-Rev) Avail: NTIS HC A02/MF A01

Mean monthly and annual values of total precipitable water are compared with mean monthly and annual values of surface dewpoint for each 5 deg latitude belt from equator to 85 deg S. The degree of relationship is good. However, the correlation coefficients are lower for latitudes 00 deg - 20 deg S than for latitudes 25 deg - 85 deg S. The computed regression equations give excellent estimates of precipitable water from surface dew-point for middle and higher latitudes in cooler seasons. Zonally averaged values of the moisture profile power index lambda for the Southern Hemisphere are presented. This power index is highly variable (-9.26(- or +) 4.57) even for mean monthly moisture profiles. The results obtained are useful for the zonally averaged climatic models. M.M.M.

STABILITY PROPERTIES OF MEDIUM-SCALE DISTURBANCES IN A BALANCE MODEL
V. Brahmananda Rao and Nelson J. Ferreira Oct. 1979 32 p refs Revised Submitted for publication
(INPR-1591-RPE/078-Rev) Avail: NTIS HC A03/MF A01

Stability properties of medium scale disturbances, their structure and energetics are studied using a two layer balance model. Under normal static stability two modes of unstable disturbances are generated: conventional baroclinic wave and a medium scale disturbance. The vertical structure of the latter mode shows that it is shallow agreeing with the observations of Nitta and Yamamoto (1974). When the static stability is low, a deep medium scale disturbance is generated. This agrees with the observations of Reed (1979). Thus the shallow or deep nature of medium scale disturbance depends on the stability of the atmosphere. Author

ELECTRO-OPTICAL HANDBOOK. VOLUME 1: WEATHER SUPPORT FOR PRECISION GUIDED MUNITIONS
Kit G. Cottrell, Paul D. Try, Donald B. Hodges, and Ronald F. Wachtmann May 1979 107 p refs
(AD-A075168; AWS-TR-79-002) Avail: NTIS HC A06/MF A01 CSCL 04/1

A foundation for weather support to Precision Guided Munitions operating at visual through microwave wavelengths is established for use by Air Weather Service base weather station forecasters and staff weather officers. Chapter 1 describes the effects of the atmosphere and the Earth's surface on electromagnetic energy. Precision Guided Munitions (PGMs) and their sensitivities to the environment are discussed in Chapter 2. The next two chapters discuss weather support concepts and techniques to support PGMs. A glossary of terms, supplemental radiative transfer theory, and example worksheets illustrating support techniques to TV, infrared, and laser designator systems are included in the appendixes. PERFORMANCE EVALUATION OF THE OPTICAL CROSSWIND PROFILER
Ruben Rodriguez and William J. Vechione Aug. 1979 82 p refs
(DA Proj. 1L1-62111-AH-71)
(AD-A075145; ERADCOM/ASL-TR-0038) Avail: NTIS HC A05/MF A01 CSCL 04/2

Field measurements of integrated path crosswinds were made at Biggs Optical Range, Biggs Army Airfield, Fort Bliss, Texas, during the period of 31 January to 8 March 1978. The measurements were made with the Optical Crosswind Profiler (OCP), a bistatic system that measures crosswinds at six locations along its path by detecting and analyzing the movement of atmospheric scintillations. This report describes the performance evaluation test, test support equipment, and data collection methodology. Data collected with this sensor were compared to integrated path wind averages measured by the calibrated anemometer array. This report presents X-Y scatter plots, derived weighting functions, and wind measurement comparison plots. Results of this test showed that the alignment procedure is

lengthy and tedious. Furthermore, simultaneous alignment of the six OCP sensors is very difficult to attain. However, once a sensor is aligned at 500 m, wind velocity values measured with it fall within 8 percent of the values obtained from the calibrated anemometer array. Operation at 2000 m is not reliable due to difficulties in obtaining and retaining alignment. GRA

PRECIPITATION ESTIMATION USING SATELLITE DATA
Bruce T. Miers Sep. 1979 44 p refs
(DA Proj. 1L1-62111-AH-71)
(AD-A075978; ERADCOM/ASL-TR-0039) Avail: NTIS HC A03/MF A01 CSCL 04/2

This report attempts to show that, by fitting particular nonlinear auto-covariance and cross-covariance functions to space-time covariance values calculated from satellite data, convective complex characteristics such as size, ellipticity, motion, growth, and decay of a storm can be determined. These modeled features then can be related to convective storm characteristics found by Scofield and Oliver. In turn, these characteristics are related to actual rainfall amounts. The results of this study are a first step in removing the subjectivity from current rainfall estimation techniques. Results from the 20 May 1977 storm over Texas and Oklahoma are presented. GRA

METEOROLOGICAL MEASUREMENTS PROGRAM DURING UNIFIED NAVY FIELD TEST PROGRAM Final Report
John M. Evans, John W. Kinch, and John H. McNeilly Aug. 1979 852 p refs
(DA Proj. 1X2-63314-D-093)
(AD-A075459; AD-E430309; ARBRL-MR-02942) Avail: NTIS HC A99/MF A01 CSCL 04/2

The Ballistic Research Laboratory participated with the Unified Navy Field Test Program conducted at the TRW Capistrano Test Site near San Clemente, CA from the fall of 1976-May 1978. Part of the BRL's responsibility in this program was to provide the meteorological measurements and analysis. These measurements provided the data required to determine optimum high energy laser propagation windows, and to predict propagation results. Meteorological parameters included in these measurements are the horizontal wind velocity normal to the propagation path, barometric pressure, wind speed and direction at several fixed points, strength of atmospheric optical turbulence, net and total solar radiation, temperature, dew point, and relative humidity. This report describes the measurement and recording techniques of the meteorological parameters, and presents the data obtained. GRA

VARIATION OF METEOROLOGICAL PARAMETERS AT SELECTED SITES IN THE NETHERLANDS [VARIATIE NAAR TIJD EN PLAATS VAN EEN AANTAL WEERSELEMENTEN IN NEDERLAND]
J. M. Terpstra 1979 17 p refs In DUTCH
(KNMI-V-314) Avail: NTIS HC A02/MF A01

The hypothesis that the inclusion of place and time information in radio broadcast weather forecasts may diminish the utility of the forecast to the public was examined using actual data. For temperature, in 25 percent to 35 percent of the cases, the omission of place indication would have resulted in a less useful forecast because of large area variations. For wind velocity, 85 percent of the time, the difference between morning and noon wind is not more than one beaufort. In the cases where this difference exceeds one beaufort, indications of time and place may be important. Author (ESA)

NUMERICAL STUDY OF PARTICLE GROWTH AND WATER VAPOR CONCENTRATION IN NOCTILUCENT CLOUDS
Ingemar Kinnmark Jan. 1979 61 p refs Prepared jointly with Intern. Meteorol. Inst.
(AP-18) Avail: NTIS HC A04/MF A01

An existing model was adapted to yield the distribution function of noctilucent cloud particles according to radius and altitude and the various assumptions regarding the temperature profile, water vapor mixing ratio, turbulent diffusion, and updraft. The specific numerical procedure known as the method of characteristics was employed. The theoretical background of this technique and the preliminary results obtained for an atmosphere with no vertical wind are presented. It is established that under the peculiar physical conditions near the mesopause the particle distribution has a well-defined peak whose position varies with the assumed water concentration and that this maximum is followed by a very sharp cut-off towards larger radii. Assuming that turbulent transport is described by the classical eddy diffusion concept, only limited changes in the mixing-ratio profile are found. Author (ESA)

OCEANIC WAVE MEASUREMENT SYSTEM Patent
John F. Holmes (Computer Sciences Corp., Falls Church, Va.) and Ronald T. Miles, inventors (to NASA) (Computer Sciences Corp., Falls Church, Va.) Issued 22 Jan. 1980 6 p Filed 16 Oct. 1978 Supersedes N79-10689 (17 - 01, p 0091) Sponsored by NASA
(NASA-Case-MFS-23862-1; US-Patent-4,184,368; US-Patent-Appl-SN-951423; US-Patent-Class-73-170A) Avail: US Patent and Trademark Office CSCL 08C

An oceanic wave measured system is disclosed wherein wave height is sensed by a barometer mounted on a buoy. The distance between the trough and crest of a wave is monitored by sequentially detecting positive and negative peaks of the output of the barometer and by combining (adding) each set of two successive half cycle peaks. The timing of this measurement is achieved by detecting the period of a half cycle of wave motion. Official Gazette of the U.S. Patent and Trademark Office

MICROSCALE MEASUREMENTS OF TEMPERATURE IN THE UPPER OCEAN FROM A TOWED BODY Ph.D. Thesis
John Carl Schedvin 1979 459 p
Avail: Univ. Microfilms Order No. 8002945

Measurements of small scale fluctuations of temperature in the upper ocean were obtained using a towed instrumentation system. Vertical profiling of the tow body, due to ship motion, showed a complex structure of pancake shaped regions. The mean vertical temperature gradient and microstructure spectral properties were homogeneous within each region, implying a common hydrodynamic origin. Towed body motions and vibrations were measured, and their effects on the temperature signals were examined. Vibrational contamination was significant, and is identified as coming from variations in the resistance of a connector in series with the low impedance, platinum film temperature sensor. It was found that comparison of the effective rate of strain to the Brunt-Vaisala frequency is a criterion for discrimination between active and fossil turbulence. Fossil turbulence regions were observed at most depths, but because the active turbulence required to produce them was not observed, it was concluded that the mixing and diffusive processes at these depths were undersampled. Dissert. Abstr.

WAVELIKE BAROCLINIC DISTURBANCES ON SHALLOW UPPER OCEAN DENSITY FRONTS Ph.D. Thesis
Richard Anthony Formato 1979 224 p
Avail: Univ. Microfilms Order No. 8003745

A theoretical development of small amplitude wave disturbances on oceanic fronts is presented. The prototype front is the inshore boundary of the Gulf Stream. A two layer model is considered in which the lower layer is much deeper than the upper, lighter layer. The frontal zone that forms the horizontal boundary of the upper layer is divided into two regions, a smaller, inner region in which the flow is dissipative and depends upon interfacial mass entrainment and turbulent friction, and a larger, outer region in which the motion is inviscid. The boundary between these two regions is placed where the internal Froude number is of order one. Both geostrophic and ageostrophic basic state (nontime varying) flows are considered under the f plane approximation. Dissert. Abstr.

EARLY DIAGENESIS OF TRACE METALS IN NEARSHORE LONG ISLAND SOUND SEDIMENTS Ph.D. Thesis
William Berry Lyons 1979 274 p
Avail: Univ. Microfilms Order No. 8003752

Sedimentary pore waters were obtained seasonally from two nearshore areas in Long Island Sound, Branford Harbor, Ct. and Mystic River Estuary, Ct. The pore waters were collected, separated from the sediments and analyzed utilizing inert atmospheric and ultraclean laboratory techniques in order to minimize any artificats due to improper sampling and contamination. The pore fluids and the sediments were analyzed for a variety of major and minor components as well as the trace metals, Fe, Mn, Zn, Cu, Pb, Cd and Ag. Sediments from these two areas were anoxic and bacterially mediated sulfate reduction was the major biogeochemical process taking place. As this process proceeded, SO4(2-) was consumed, sedimentary organic matter was oxidized and HS(-), PO4(3-), NH4(+), titration alkalinity and dissolved organic carbon was produced. Other significant observations as well as the results are reported. Dissert. Abstr.

COASTAL WATER TEMPERATURES IN THE SOUTHEASTERN PORTION OF BRAZIL FROM OCEANOGRAPHIC DATA AND NOAA SATELLITE OBSERVATIONS, VOLUME 1 [TEMPERATURAS DAS AGUAS DA COSTA SUDESTE DO BRASIL, OBTIDAS ATRAVES DE DADOS OCEANOGRAFICOS E DE DADOS DE SATELITES DA SERIE NOAA, VOLUME 1]
Hector Manuel Inostroza Villagra and Jose Luiz Stech Sep. 1979 101 p refs In PORTUGUESE; ENGLISH abstract
(INPE-1569-RPE/070) Avail: NTIS HC A06/MF A01

Sub surface temperature charts in the southeastern coast of Brazil, utilizing oceanographic data and thermal sensor data of NOAA's satellites are presented. A detailed analysis of 350 oceanographic stations resulted in the finding of a marked seasonal tendency in the vertical temperature structure of the waters. A correlation was established between the surface and vertical thermal structure. The analysis was done on a weekly time basis with the year 1970 as the reference year. Temperature charts at the depth of 50 m were done for the four seasons of the year, as an example of the applicability of the model, with results considered as satisfactory in a first approach. MISSION AND SENSOR CONCEPTS FOR COASTAL AND OCEAN MONITORING USING SPACECRAFT AND AIRCRAFT
W. L. Darnell Jan. 1980 48 p refs
(NASA-TM-80103) Avail: NTIS HC A03/MF A01 CSCL 08C

A concept developed for a 1990 oceanic mission which places strong emphasis on coastal monitoring needs is described and analysed. The concept assumes that use of one active spacecraft in orbit and one on standby plus airplanes and data collection platforms which provide continuing complementary coverage and surface truth. The coastal measurement requirements and goals, the prospective oceanic and coastal sensors, the spacecraft and aircraft data platforms, and the prospective orbit designs are discussed. A.W.H.

STUDY OF OCEANIC LITHOSPHERE USING GEOS-3 RADAR ALTIMETER DATA Final Report, 1 Oct. 1977 - 30 Sep. 1979
M. C. Roufosse Jul. 1979 29 p refs
(Contract F19628-78-C-0003; AF Proj. 2309)
(AD-A077344; AFGL-TR-79-0181) Avail: NTIS HC A03/MF A01 CSCL 08/7

The aim of this work is to study the mechanical properties and time evolution of the lithosphere. For that purpose, geoid heights derived from the Geos 3 radar altimeter were used. The study of the correlation existing between bathymetry and free-air anomalies or geoid heights gives information on the mechanical properties of the lithosphere and its thickness. The lithospheric thickness is related to the age of the lithospheric plate, and by probing several locations spanning varied temporal situations, one is able to retrace the time evolution of the lithospheric plates. Toward that aim, several seamount chains, islands, and ridges have been investigated in the Pacific, Atlantic, and Indian Oceans. In the regions studied so far, the age of the lithosphere at the time of loading is the primary parameter. In this work, the author attempts a systematic study of all the parameters

influencing the observed mechanical properties of the lithosphere. GRA

A SUMMARY OF WAVE DATA NEEDS AND AVAILABILITY Final Report
M. D. Burkhart, E. S. Dillon, and O. H. Oakley Aug. 1979 30 p
(Contract DOT-CG-80356-A)
(AD-A076067) Avail: NTIS HC A03/MF A01 CSCL 08/3

The paper consists of three parts. First is a summary of the wave data needs of three classes of maritime interests: (a) designers of ships and floating and fixed offshore platforms, (b) regulatory bodies and classification societies primarily interested in safety and environmental protection, and (c) operators concerned with ship routing and offshore activities such as oil and mineral recovery and energy production. The second part is a summary of the status of wave data, and the third part is a set of conclusions. The present wave data base to meet the developing needs of designers of ship and offshore structures, regulatory bodies, and operators is incomplete. To complete it using only in situ measurement methods such as buoys appears impractical. However, these do have important use in the collection of data for special areas of interest, particularly where severe seas are known to occur, and for verification and calibration of hindcast and satellite measurement techniques. The two most promising means of developing the required wave climatology appear to be: (a) by hindcasting techniques and (b) by satellite observations. Hindcasting techniques, which can produce broadband directional spectra, are well advanced but require additional verification. Satellite techniques and hardware will not be available for some years. Visual observations by mariners continue; although these observations cannot provide quantitative (spectral) data, they are valuable for estimating long-term wave-height distribution. GRA

REMOTE IDENTIFICATION OF A SALT WATER WEDGE THROUGH DISSIPATIVE MEDIA WITH A MONOCYCLE RADAR
C. L. Bertram and R. A. Shore Oct. 1979 125 p refs
(Contract N00014-79-C-0160)
(AD-A076621) Avail: NTIS HC A06/MF A01 CSCL 08/3

One purpose of this study is to show theoretically the potential of a monocycle technique to detect and identify salt water wedges under dissipative fresh water. Also, the potential use for bathymetry is discussed, in particular for bodies of water of extremely low salinities as may be expected in some parts of the Baltic Sea, in Fjords and in large estuaries. The importance of bathymetry for military operations in shallow water is well known. It happens to be that some bodies of water with very low salinity are in areas of particular military sensitivity. Salt water wedges are of military importance for small submarines, swimmers and swimmer delivery vehicles and mine and counter mine warfare. GRA

TESTS OF LASER INDUCED FLUORESCENCE FROM ALGAE AT SEA [LASERINDUCERAD FLUORESCENS FRAAN ALGER. RESULTAT FRAAN FTT BAATBURET FAELTFOERSOEK]
Brit Hartmann, Ove Steinvall, and Anders Widen Jul. 1979 52 p refs In SWEDISH
(FOA-C-30171-E1) Avail: NTIS HC A04/MF A01

Fluorescence from algae illuminated by a boat mounted laser was measured to see if the technique is feasible for airborne ocean surveillance of algae concentrations and oil or chemical spills. Good agreement was found between the laser data and manually gathered data, but uncertainty about chlorophyll concentrations requires that the airborne system be complemented with a ground truth calculation method in some parts of the area surveyed. (NASA-CR-162806; EPL-79-1) Avail: NTIS HC A03/MF A01 CSCL 06C

A standardized dissection and chemical analysis procedure was developed for individual animals of several species in the size range mouse to monkey (15 g to 15 kg). The standardized procedure permits rigorous comparisons to be made both interspecifically and intraspecifically of organ weights and gross chemical composition in mammalian species series, and was applied successfully to laboratory mice, hamsters, rats, guinea pigs, and rabbits, as well as to macaque monkeys. The procedure is described in detail. R.E.S.

THE CARBON ISOTOPE BIOGEOCHEMISTRY OF THE INDIVIDUAL HYDROCARBONS IN BAT GUANO AND THE ECOLOGY OF INSECTIVOROUS BATS IN THE REGION OF CARLSBAD, NEW MEXICO
David J. DesMarais, J. M. Mitchell (Indiana Univ., Bloomington), W. G. Meinschein (Indiana Univ., Bloomington), and J. M. Hayes

Feb. 1980 46 p refs
(NASA-TM-81164; A-8056) Avail: NTIS HC A03/MF A01 CSCL 06C

The structures and C-13 contents of individual alkanes extracted from bat guano found in the Carlsbad region of New Mexico can be related to both the photosynthetic pathways of the local plants and the feeding habits of the insects that support the bats. Carbon isotopic analyses of the 62 most important plant species in the Pecos River Valley, the most significant feeding area for the Carlsbad bats, reveal the presence of 29 species with C3 photosynthesis and 33 species, mostly grasses, with C4 photosynthesis. Although the abundances of nonagricultural C3 and C4 plants are similar, alfalfa and cotton, both C3 plants, constitute over 95 per cent of the crop biomass. The molecular composition of the bat guano hydrocarbons is fully consistent with an insect origin. Two isotopically distinct groups of insect branched alkanes were discerned. These two groups of alkanes derived from two chemotaxonomically distinct populations of insects possessing distinctly different feeding habits. It is likely that one population grazes predominantly on crops whereas the other population prefers native vegetation. This and other isotopic evidence supports the notion that crop pests constitute a major percentage of the bats' diet. Author

EFFECT OF RESTRICTED MOTION IN HIGH TEMPERATURE ON ENZYMATIC ACTIVITY OF THE PANCREAS
A. Abdusattarov and G. I. Smirnova Feb. 1980 6 p refs Transl. into ENGLISH from Uzbeksk. Biol. Zh. (USSR), no. 1, 1979 p 35-37 Transl. by Sci. Transl. Service, Santa Barbara, Calif.
(Contract NASw-3198)
(NASA-TM-76063) Avail: NTIS HC A02/MF A01 CSCL 06C

Effects of 30 day hypodynamia coupled with high temperature (35-36 C) on enzymatic activity of the pancreas of male adult rats were studied. The test animals were divided into four groups. Group one served as controls (freedom of movement and a temperature of 25-26 C, considered optimal). The remaining animals were divided into three additional groups: Group two freedom of movement but high temperature (35-36 C); group three hypodynamia but an optimal temperature; group four hypodynamia and 35-36 C. Considerable change in the enzymatic activity in the pancreas of the four groups is observed in three experimental groups (two, three, and four) as compared to the control (group one). The results indicate that adaption of the organism to the thermal factor and restricted movement is accompanied by a change in the enzymatic spectrum of the pancreas. With the combined effect of these two stresses under conditions of the adaption of the organism especially sharp shifts occur in the enzymatic activity. R.E.S.

EFFECT OF CONSECUTIVE COOLING AND IMMOBILIZATION ON CATECHOLAMINE METABOLISM IN RAT TISSUES
E. Sh. Matlina, S. M. Waysman, I. G. Zaydner, B. M. Kogan, and L. V. Nozdracheva Nov. 1979 19 p refs Transl. into ENGLISH from Fiziol. Zh. SSSR (USSR), v. 60, no. 4, Apr. 1974 p 540-547 Trans. by Scientific Translation Service, Santa Barbara, Calif.
(Contract NASw-3198)
(NASA-TM-75962) Avail: NTIS HC A02/MF A01 CSCL 06C

The combined effect of two stressor stimuli--cooling and immobilization--acting successively on the sympathetic-adrenaline system was studied experimentally in rats that were cooled for 8 hours at 7 C on the first day and immobilized for 6 hours on the next day. The biochemical and histochemical methods used and the experimental technique involved are described in detail. The following conclusions were formulated: (1) the successive action of cooling and immobilization results in a stronger decrease in the adrenaline and noradrenaline content in the adrenal gland than that which could be due to a simple summation of the cooling and immobilization effects; (2) successive cooling and immobilization are followed by activation of catecholamine synthesis in the adrenal gland; and (3) 1-DOPA administration (45 mg/kg 3 times in 2 days) intraabdominally activated catecholamine synthesis in the adrenal glands in both the control and test animals. R.E.S.

(Contract NASw-3199)
(NASA-TM-75985) Avail: NTIS HC A02/MF A01 CSCL 06C

Total non-enzymatic fibrinolytic activity in the blood of rats increased three times in response to stress caused by 30 minute immobilization, and the activity of epinephrine-heparin complex increased nine times. In adrenalectomized animals, which showed a weak response to the same stress, intraperitoneal injection of hydrocortisone 30 minutes prior to immobilization normalized the response. Obtained results indicate that adrenalectomy leads to sharp reduction of heparin complexing with thromogenic proteins and epinephrine, while substitution therapy with hydrocortisone restores anticoagulation system function. Reactions to hypoxia and hypoknesia were compared by measuring charges in the amount of ribonucleic acid (RNA) in the cytoplasm of neurons of the intumescentia cervicalis and lumbalis. Animals were subjected to hypoxia, hypokinesia and both combined and a control group to neither. A total of two groups of motoneurons were compared, one innervating the respiratory musculature, the other the musculature of the lower extremities, so that hypoxic hypoxia would probably affect the first group primarily and hypokinesia the second. Results indicate that neither affect the amount of RNA in the neurons of the first group but a significant increase is noted in neurons of the second group. Other significant results are reported. INTRA-OCULAR PRESSURE NORMALIZATION TECHNIQUE AND EQUIPMENT Patent
William J. McGannon, inventor (to NASA) Issued 22 Jan. 1980 5 p Filed 31 Aug. 1977 Supersedes N77-30727 (15 - 21, p 2839)
(NASA-Case-LEW-12723-1; US-Patent-4,184,491; US-Patent-Appl-SN-829317; US-Patent-Class-128-276; US-Patent-Class-128-760) Avail: US Patent and Trademark Office CSCL 06B

A method and apparatus for safely reducing abnormally high intraocular pressure in an eye during a predetermined time interval is presented. This allows maintenance of normal intraocular pressure during glaucoma surgery. According to the invention, a pressure regulator of the spring biased diaphragm type is provided with additional bias by a column of liquid. The height of the column of liquid is selected such that the pressure at a hypodermic needle connected to the output of the pressure regulator is equal to the measured pressure of the eye. The hypodermic needle can then be safely inserted into the anterior chamber of the eye. Liquid is then bled out of the column to reduce the bias on the diaphragm of the pressure regulator and, consequently, the output pressure of the regulator. This lowering pressure of the regulator also occurs in the eye by means of a small second bleed path provided between the pressure regulator and the hypodermic needle. Alternately, a second hypodermic needle may be inserted into the eye to provide a controlled leak off path for excessive pressure and clouded fluid from the anterior chamber.

THE EFFECTS OF SPECTRAL DENSITY AND STIMULUS INTENSITY ON THE ELICITATION OF THE ACOUSTIC REFLEX Ph.D. Thesis
Colleen Ann Mcaleer 1979 159 p
Avail: Univ. Microfilms Order No. 8003475

The acoustic reflex (AR) responses of normal hearing and hearing-impaired subjects elicited by moderate and high tensity stimuli when the stimulus energy was contained within an AR critical band were compared. The effects of minimum and maximum spectral density of the elicitation and growth of the AR were also investigated. The results show that ARTs were higher in dB sound pressure level for all four stimulus conditions for the hearing-impared than for the normal hearing subjects. Additionally, stimulus spectral density within a critical band had a differential effect on the elicitation of the AR for normal hearing and hearing-impaired subjects. The differences between the AR responses of normal hearing and hearing-impaired subjects could

be attributed to the anatomical and physiological changes that accompany a noise-induced hearing loss. Dissert. Abstr.

Skeletal muscle fatigue is examined utilizing an in situ dog gastrocnemius-plantaris muscle preparation. Skeletal muscle fatigue (reduced force output for a given stimulus) results from a thirty minute period of isometric contractions at 2.5 to 20/sec. This fatigue is not a result of failure of motor nerve propagation or transmitter release. The ratio of oxygen uptake to developed tension is unaltered during or following fatiguing contractions. Energy sources are available and with maximal activation the contractile mechanism is capable of the same force output it had before the fatiguing contractions. Further, there is no reduction in twitch developed tension associated with intracellular acidosis. It appears that twitch fatigue results from a reduced activation of the myofilaments during a twitch contraction. This may be due to either a reduced sarcoplasmic Ca2(+) concentration during contraction or a reduced response of the myofilaments at a given CA2(+) concentration. Dissert. Abstr.

MICROVASCULAR DETERMINANTS OF OXYGEN SUPPLY IN RESTING AND CONTRACTING STRIATED MUSCLE Ph.D. Thesis
Bruce Maurice Klitzman 1979 138 p
Avail: Univ. Microfilms Order No. 8002544

The alteration of striated muscle oxygen supply in response to increases in oxygen demand induced by twitch contraction was examined. The approach taken was to measure the four most important microvascular determinants of tissue oxygen supply: arteriolar diameter, capillary density, tissue PO2, and hematocrit. Using the results of this study obtained at the microvascular level, muscle oxygen consumption was estimated to increase 9.8 fold with 1 Hz twitch contraction. Perfused muscle studies have found an increase of 8 fold with 1 Hz contraction. These results from microvascular and whole organ studies are remarkably close, indicating that the parameters chosen in this study as determinants of oxygen supply do in fact accurately reflect oxygen supply when considered collectively. Dissert. Abstr.

CIRCADIAN RHYTHMICITY IN VENTRICULAR MYOCARDIAL AND DIAPHRAGMATIC METABOLISM Ph.D. Thesis
Susan Marie Garthwaite 1979 121 p
Avail: Univ. Microfilms Order No. 8002361

Circadian rhythm studies were utilized to elucidate metabolic mechanisms operative in ventricle and diaphragm of unstressed animals. Male Wistar rats were sampled after two weeks of entrainment to a 12L:12D light cycle in which the lights came on at 0600 hours and went off at 1800 hours. Food and water were available ad lib. Ventricular and diaphragmatic samples were obtained from each rat at 4 hour intervals during the 24 hour cycle. Weight of the stomach contents of the same rats was also determined as an index of food consumption. A circadian rhythm in ventricular glycogen was found with a peak at 0600 hours and a nadir at 1800 hours. Ventricular free fatty acid and triglyceride levels also showed a circadian rhythm, but 180 deg out of phase with the glycogen rhythm. A circadian rhythm of diaphragmatic glycogen was found with a peak value preceding the ventricular glycogen peak by about 4 hours. Other significant results are reported. Dissert. Abstr.

MUSCULAR FORCE-VELOCITY ALTERATIONS CONSEQUENT TO SLOW AND FAST VELOCITY POWER TRAINING Ph.D. Thesis
Edward Francis Coyle 1979 77 p
Avail: Univ. Microfilms Order No. 8003049

Muscular force-velocity alterations were compared to slow and fast velocity power training. Active males trained the knee extensors of both legs simultaneously for six weeks, three times per week, by attempting to generate maximal peak torque (MPT) with each repetition at velocities of 60 deg/sec (MPT/60), 300 deg/sec (MPT/300), or both. Fast training significantly improved MPT uniformly (16-21%) at the training velocity as well as at slower velocities. Only the MPT/180 and MPT/300 improvements contained a significant physiological component of adaptation. High tension producing contractions appear necessary to improve MPT/slow while fast training velocities must be employed to improve MPT/fast. Fast training improves MPT in the mid-velocities more effectively than does slow training. Dissert. Abstr.

MODELS OF HUMAN VISION IN DIGITAL IMAGE BANDWIDTH COMPRESSION Ph.D. Thesis
Douglas James Granrath 1979 181 p
Avail: Univ. Microfilms Order No. 8003051

The study of human vision is applied to the problem of reducing the amount of information necessary to represent an image. Relevant vision research is reviewed, including eye and retina anatomy, membrane potential recordings, and psychophysical studies. Current engineering models of human vision are discussed in terms of their structural similarities to the eye. A two-channel model of spatial interaction in the retina is then developed based on retinal cell structure and related experimental results. Analysis of this model shows that one of the channels carries mainly image contrast information while the other carries edge detail. Computer simulation results demonstrate a bandwidth reduction potential from 8 bits per pixel down to 2 bits per pixel for the model. Suggestions for further research include use of the two-channel model to predict image quality. Dissert. Abstr.

MATHEMATICAL ANALYSIS OF CARBON DIOXIDE TRANSPORT BY BLOOD Ph.D. Thesis
Ramon Fayad 1979 191 p
Avail: Univ. Microfilms Order No. 8003061

A theoretical analysis of acid-base balance at the microcirculatory level is presented. A mathematical model that includes the physiological and biochemical processes important to carbon dioxide transport by blood is constructed. Using perturbation and time scale techniques to study the steady-state problem, analytic solutions are obtained for the cases when no change in saturation of hemoglobin occurs and when a linear decrease in oxygenation of blood from the arterial to the venous end of the capillary occurs. The extent to which the various processes contribute to carbon dioxide transport by blood is determined, and it is found that while the dependence of CO2 exchange on O2 (Haldane effect) accounts for 40% of carbon dioxide transport, the magnitude of the Bohr effect is rather small. Dissert. Abstr.

CONTINUOUS REAL-TIME AUDITORY EVOKED POTENTIALS USING A SLIDING WINDOW OF AVERAGES Ph.D. Thesis
Nicholas Antrony Diakides 1979 195 p
Avail: Univ. Microfilms Order No. 8003453

Procedures and computer instrumentation which would advance the state of the art in auditory evoked response (AER) measurement, especially to alleviate the need for prolonged testing periods required by the traditional method of AER measurement were developed. The key to an improved method lay in the use of high rates of presentation of auditory stimuli, i.e., 20-50 Hz, and a means of continuously averaging and updating the output data (sliding window of averages). The high stimulus rates would allow more responses to be obtained and evaluated in a very short time, i.e., a few seconds. A clearly observable enhancement of AER amplitude was found at and around 45 Hz with correspondingly high signal-to-noise ratios (SNRs) when referenced to ongoing EEG background activity levels. Having demonstrated the fundamental phenomenon of AER and SNR enhancement at high stimulus frequencies, a low cost microcomputer system and operational algorithm were developed and successfully tested. Dissert. Abstr.

MASS TRANSFER STUDIES OF PULMONARY FUNCTION Ph.D. Thesis

Simon Hallifax Hobbs 1979 282 p
Avail: Univ. Microfilms Order No. 7928647

A comprehensive lung model was developed which takes into account both diffusion and ventilation distribution effects. Particlar emphasis was placed on the simulation of the pulmonary transport of insoluble inert gases, especially nitrogen, helium, and sulfur hexafluoride, which are commonly used in respiratory diagnostic testing. An expression was developed to describe individual lung unit alveolar gas concentrations, in terms of the most important lung parameters. The ventilation distribution found throughout the lung was the critical factor controlling gas concentration since it severely limited transport of gas into poorly ventilated lung regions. Dissert. Abstr.

THE RADIATION PROTECTION PROGRAM. Annual Report, 1977
1978 798 p refs Partly in ENGLISH, FRENCH and GERMAN
(EUR-5972; ISBN-92-825-0184-1) Copyright Avail: Issuing Activity

Five hundred seventy-four papers published as a result of research are presented under six headings. These are dosimetry, radioactive contamination of the environment, hereditary effects of ionizing radiation, somatic short-term effects of ionizing radiation, somatic long-term effects of ionizing radiation, and evaluation of radiation risks. Much research was undertaken into the damaging effects of radiation on chromosomes and other genetic material. Somatic effects of radiation in the induction of leukemia and carcinogenesis as well as the controlled use of radiation in the treatment of diseases were studied. The environmental impact of radiation on the water cycle and food chain are also covered. Author (ESA)

THE HUMAN BODY TEMPERATURE REGULATION SYSTEM
J. Werner Sep. 1979 24 p refs Transl. into ENGLISH from Biol. Cybernetics (West Germany), v. 17, 1975, p 53-63
(RAE-Lib-Trans-2019; BR71910) Avail: NTIS HC A02/MF A01

The control loop of human body temperature is treated as a distributed parameter system. The equations of heat balance are formulated, admitting discontinuities of parameters. Using two successive integral transformations and an expansion with eigenfunctions, an analytical solution is found for the closed control loop. Regarding the stationary as well as the dynamic behavior, the mathematical results are on the whole compatible with experimental results. K.L.

SIZE AND LUMINANCE DISCRIMINATION IN THE PERIPHERAL VISUAL FIELD
Stephen E. Jenkins Oct. 1979 28 p refs
(MRL-R-760; AR-001-843) Avail: NTIS HC A03/MF A01

The discrimination of length differences between two bars as well as size and luminance differences between two discs was measured as a function of the angle of eccentricity between the fixation point and the stimulus. The experiments provided basic data necessary for the interpretation of experiments involving the detection of discs embedded in a complex background which in turn elucidate the determinants of camouflage. It was found that: (1) discs are discriminated in size by virtue of their difference in diameter rather than their difference in area; (2) the 50% and 90% levels of detection probability of size and luminance contrast between two discs are linear functions of eccentricity at least to 14 deg eccentricity; (3) the visual system is better at discriminating size contrast at all eccentricities tested than it is at discriminating luminance contrast; and (4) there is a fundamental difference between the mechanisms which mediate size and luminance discrimination. K.L.

During 5 weeks in a climatic room, total sweat during work almost doubled. Initial hour differences increasingly equalized. There was a displacement of sweat secretion from trunk to extremities till the end of week 3, occurring earlier and more clearly for the arm than for the leg. Work temperatures dropped rapidly and evenly to a constant level by day 11. Circulation behavior matched that of temperature. Pulse rate during work dropped like rectal temperature and pulse rate during rest was phasically like the pattern of corresponding temperatures. Except

best copy available

for the first days urine output was adequate and even, Na decreasing in the urine until week 3, then returning to initial values. Na and K in sweat declined but with opposite patterns for hours 1-4. Total salt elimination decreased. The conclusive phenomena of redistribution occurred within the first 3 weeks. A few functions changed later also. Relatively trivial changes in an otherwise uniform reaction pattern indicated that after 3 or even 5 weeks of acclimatization the process is not over or at least not completely so. The tempo of the process appears to be a function of the degree of loading. Author

EFFECT OF HYPOKINESIA ON CONTRACTILE FUNCTION OF CARDIAC MUSCLE

F. Z. Meyerson, V. I. Kapelko, A. M. Trikhpoyeva, and M. S. Gorina. Feb. 1980. 12 p. refs. Transl. into ENGLISH from Kardiologiya (USSR), no. 2, Feb. 1979, p. 71-76. Transl. by Scientific Translation Service, Santa Barbara, Calif.
(Contract NASw-3198)
(NASA-TM-76061) Avail: NTIS HC A02/MF A01 CSCL 06S

Rats were subjected to hypokinesia for two months and the contractile function of isolated papillary muscle was studied. Hypokinesia reduced significantly the isotonic contraction rate which depended on the ATPase activity of the myofibrils; it also reduced the rate and index of relaxation which depended on the functional capacity of the Ca(++) pump of the sarcoplasmic reticulum. The maximum force of isometric contraction determined by the quantity of actomyosin bridges in the myofibrils did not change after hypokinesia. This complex of changes is contrary to that observed in adaptation to exercise when the rate of isotonic contraction and relaxation increases while the force of isometric contraction does not change. The possible mechanism of this stability of the contractile force during adaptation and readaptation of the heart is discussed. Author

OBJECTIVE MEASUREMENT OF HUMAN TOLERANCE TO +G SUB Z ACCELERATION STRESS. Ph.D. Thesis - Univ. of N. Indiana

Salvadore A. Rositano. Washington, Feb. 1980. 100 p. refs. (NASA-TM-81166; A-8059) Avail: NTIS HC A05/MF A01 CSCL 06S

The efficacy of a new objective technique using a transcutaneous Doppler flowmeter to monitor superficial temporal artery blood flow velocity during acceleration was investigated. The results were correlated with current objective and subjective G tolerance end points. In over 1300 centrifuge runs, retrograde eye level blood flow leading to total flow cessation was consistently recorded and preceded visual field deterioration leading to blackout by 3 to 23 seconds. The new method was successfully applied as an objective indication of tolerance in a variety of test situations including evaluation of g-suits, straining maneuvers, and 13 deg, 45 deg and 65 deg set back angles. EFFECTS OF GRAVITATIONAL STRESS, HYPOKINESIA AND HYPODYNAMIA ON THE STRUCTURE OF THE VASCULAR BED OF THE SPLEEN

N. T. Nesterenko. Feb. 1980. 12 p. refs. Transl. into ENGLISH from Arkh. Anat., Gistol. Embriol. (USSR), v. 64, no. 5, 1973, p. 44-51. Transl. by Kanner (Leo) Associates, Redwood City, Calif. Original doc. prepared by 1st Leningrad I. P. Pavlov, Medical Inst.
(Contract NASw-3199)
(NASA-TM-75934) Avail: NTIS HC A02/MF A01 CSCL 06S

The effects of two extreme factors, hypokinesia and hypodynamia, on spleen vascular beds were studied on 180 male and female albino rats. Vessels were studied by roentgenography, microroentgenography, clearing of sections and histology. Gravity stress yielded constriction of all links of arterial bed and of order 5-7 veins. Large intraorganic vein diameters changed significantly but erratically. Hypokinesia in early phases produced pronounced spleen size reduction. Veins and arteries constricted along entire length. Later hypokinetic stages showed arteries still constricted, veins began to dilate from week 4 of hypokinesia. Sinuosity, uneven contours and varicose dilations of walls in large arteries and veins occurred. Abrupt changes in parenchyma, e.g., atrophy of folliculi, narrowing of lumen of central arteries from thickening of muscular wall. After exposure to hypokinesia followed by gravitational stress, pronounced lesions such as deformation of vascular wall, including rupture, in all vessels of the spleen vascular bed. R.E.S.

VIBRATION INJURIES OF THE HAND AND ARM: THEIR OCCURENCE AND THE EVOLUTION OF STANDARDS AND LIMITS

M. J. Griffin. Jul. 1979. 85 p. refs.
(Contract HSE-1653/45.09)
(ISVR-TR-101) Avail: NTIS HC A05/MF A01

Alternative methods of rating the serverity of vibration exposures for the hand and arm are compared. The difficulties associated with the formulation of useful vibration standards and limits are discussed and deficiencies in present standards are outlined. Specific recommendations concerning the formulation of standards and limits are offered. Desirable objectives for surveys of worker health, tool vibration characteristics, and working methods are defined. The need for reducing and isolating tool vibration is identified along with the importance of tool gripping methods. It is suggested that an improved understanding of the nature of vibration injuries and their symptoms is required. Author (ESA)

APPLICATION OF MUTUAL AMOUNT OF INFORMATION FOR TIME DELAY ESTIMATION. Ph.D. Thesis

G. W. vanArragon. 6 Aug. 1979. 80 p. refs. Partly in ENGLISH and DUTCH
(THT-210) Avail: NTIS HC A05/MF A01

An estimate for the average mutual amount of information (AMAI) as a function of time delay between two time series was developed. This estimate is intended for analyzing the spread of an epileptic seizure through the cortical layers of the brain of an epileptic patient based on an ictal EEG recording. The theory of mutual amount of information is reviewed. It depends on the marginal and joint probability densities of two time series. An estimator for the joint (bi-variate) density is proposed and compared with estimators described in the literature. Results show that the proposed estimator is the best for practical AMAI estimation. A computer algorithm for AMAI estimation was derived and its behavior studied using test data. Promising results lead to its inclusion in an interactive FORTRAN program which is

available as part of an EEG analysis library for special purposes.

THE POWER PROCESS: A SYNTHESIS THEORY OF POWER Ph.D. Thesis
Steven Howard Graubard 1979 418 p
Avail: Univ. Microfilms Order No. 8003230

A series of studies designed to test the process approach to power is offered. In order to describe the power process adequately, a blend of phenomenological and empirical methods is suggested. Phenomenological techniques are expected to yield subjects' descriptions, thoughts and feelings associated with power related experiences. This data is analyzed for thematic content as it relates to each of the four power process components and compared with data obtained from empirical measures. Experimental situations, including small group interactions, individual tasks, experimental descriptions, and specific psychological tests, are suggested. Implications for future research are discussed.

PILOT SELECTION USING PSYCHOLOGICAL METHODS [URVAL AV FLYGFOERARE MGD PSYKOLDGISKA METODER]
Leif Carlstedt Mar. 1979 62 p refs In SWEDISH
(FOA-C-55024-H7) Avail: NTIS HC A04/MF A01

The use of psychological methods in military aircraft pilot selection is surveyed, covering the period from World War 1 to 1979. The methods of analysis used have different starting points, stressing either the man or the function characteristics. A multiple regression statistical evaluation model is most frequently used resulting in some compensation of psychological characteristics. No examples of normative evaluation models were found in recent pilot selection methods.

MODELING REQUIREMENTS FOR NETWORK SIMULATION OF HUMAN-MACHINE SYSTEMS Ph.D. Thesis
Gayle Lynn Berry 1979 335 p
Avail: Univ. Microfilms Order No. 8003862

A critical review of eight task taxonomies was performed. Each taxonomy was ranked against a set of criteria which were developed to select for usefulness in modeling human machine systems. The standard task analysis procedure was revised so that all information required for a network computer simulation of a human machine system would be produced. The two highest ranking task taxonomies were used in the task analysis procedure to model a test case human machine system. A SAINT computer simulation was performed for each of the two resulting models. For each simulation model, both Normal and Weibull distributions were used in four different combinations to represent human task performance time. In order to make it possible to use the Weibull distribution when no sample data were available, a method was developed to derive the Weibull parameters for shape and scale from an estimated mean and standard deviation.

STS MISSION DURATION ENHANCEMENT STUDY: (ORBITER HABITABILITY) Final Report
A. D. Carlson Dec. 1979 145 p
(Contract NAS9-15903)
(NASA-CR-160535; SOD-79-0321) Avail: NTIS HC A07/MF A01

Habitability improvements for early flights that could be implemented with minimum impact were investigated. These included: (1) launching the water dispenser in the on-orbit position instead of in a locker; (2) the sleep pallet concept; and (3) suction cup foot restraints. Past studies that used volumetric terms and requirements for crew size versus mission duration were reviewed and common definitions of key habitability terms were established. An accurately dimensioned drawing of the orbiter mid-deck, locating all of the known major elements was developed. Finally, it was established that orbiter duration and crew size can be increased with minimum modificattion and impact to the crew module. Preliminary concepts of the aft med-deck, external versions of expanded tunnel adapters (ETA), and interior concepts of ETA-3 were developed and comparison charts showing the various factors of volume, weight, duration, size, impact to orbiter, and number of sleep stations were generated.

A NEW ANTI-G VALUE FOR HIGH-PERFORMANCE AIRCRAFT Final Report, 1 Jan. 1977 - 1 Jan. 1979
Russell R. Burton, Robert M. Shaffstall, Jamy L. Jaggars, Kent K. Gillingham, and Kenneth W. Stevens Nov. 1979 25 p
(AF Proj. 7930)
(AD-A076904; SAM-TR-79-27) Avail: NTIS HC A02/MF A01 CSCL 22/1

The USAF School of Aerospace Medicine (USAFSAM) Crew Technology Division has developed an advanced anti-G valve for pressurizing the anti-G suit during exposures to acceleration. The anti-G valve presently in fighter aircraft has been determined to operate too slowly for rapid onset of G, potentially causing pilots of high-performance aircraft to black out, lose consciousness, and/or become fatigued. The time relationship to G-suit pressurization using the conventional anti-G valve was found to be sigmoidal, having two relatively slow pressurization phases--one early, and the other late--in the suit-inflation schedule. Elimination of these two slow phases were accomplished by: (1) preinflating the anti-G suit to 0.2 psi prior to an increase in G (called 'Ready Pressure'), and (2) increasing the capacity of air flow through the anti-G valve (called 'Hi-Flow'). The development of the Hi-Flow Ready Pressure (HFRP) anti-G valve by USAFSAM increased in the rate of G-suit pressurization threefold. This HFRP anti-G valve was tested on eight F-15 pilots, using the centrifuge at the Naval Air Development Center, Warminster, Pa. A comparison of this experimental valve with the conventional anti-G valve (presently operational in the F-15 aircraft) resulted in a high degree of pilot acceptance, because the HFRP valve had better valve response, reduced valve error scores, and allowed the pilots to tolerate high-G exposures with less effort.

RELACS, AN ASSOCIATIVE COMPUTER ARCHITECTURE TO SUPPORT A RELATIONAL DATA MODEL Ph.D. Thesis
Ellen Jane Oliver 1979 418 p
Avail: Univ. Microfilms Order No. 8004513

The problem of implementing a relational data model on a computer system designed expressly for that purpose is discussed. A proposed computer architecture for a relational associative computer system, (RELACS), is introduced. It is shown that the proposed system is capable of supporting many functions of a data base management system. Timing equations are developed to describe the operation of RELACS for retrieval, deletion, modification and addition. These equations are utilized to examine the behavior of RELACS when relation cardinality, associative array memory (AAM) size, the number of attributes in the query and the number of relations in the query are varied. Results indicate that the larger the AAM up to a maximum of the relation cardinality, the faster was the processing. The AAM size is affected by the speed and cost requirements of the Data base management system as well as the expected relation cardinality. It was also found that the time to process a query increases as the number of attributes and/or relations is increased. Dissert. Abstr.

A MATHEMATICAL MODEL FOR A VIRTUAL MACHINE MONITOR AND ITS SUPPORTIVE STRUCTURE Ph.D. Thesis
Duc Tan Nguyen 1979 174 p
Avail: Univ. Microfilms Order No. 8002711

A functional mathematical model is developed for a virtual machine monitor (VMM) on either uniprocessor or distributed processor support systems. The support systems should have a monostate architecture or should be dynamically microprogrammable so that they can emulate such an organization. Five studies are undertaken in the research: (1) an examination of the capability of existing dataflow languages to describe operating systems, in particular, to model VMM functions, (2) an investigation of a specific VMM and its support architecture to be used as a basis for the research, (3) the construction of an abstract dataflow model for the selected structure, (4) the formalization of the relationship between elements of the VMM and its support architecture using algebraic and functional relations, and (5) a demonstration that the abstract dataflow model exhibits the same behavior as does the base structure. Dissert. Abstr.

TEST GENERATION FOR MICROPROCESSORS Ph.D. Thesis
Satish Mukund Thatte 1979 172 p
Avail: Univ. Microfilms Order No. 8004286

Test generation procedures for testing microprocessors in a user environment are developed. A general graph-theoretic model for microprocessors is developed at the register transfer level. Any microprocessor can be easily modeled using information only about the instruction set and the functions performed by it. A fault model is developed on a functional level quite independent of the implementation details. The effects of faults in the fault model are investigated at the level of the graph theoretic model. Test generation procedures are proposed which take the microprocessor organization and the instruction set as parameters and generate tests to detect all the faults in the fault model. The complexity of the test sequences measured in terms of the number of instructions is given. Efforts in generating tests for a real microprocessor and evaluating their fault coverage are described. Dissert. Abstr.

OPTIMAL DISTURBED MICROPROCESSOR ARCHITECTURE USING MULTI-PHASE PROCESSING TO PERFORM A VECTOR, MATRIX MULTIPLICATION Ph.D. Thesis
Larry Gene Stotts 1979 150 p
Avail: Univ. Microfilms Order No. 8003605

The application of optimal design criteria to the implementation of an array processor is explored. The algorithm and the hardware are simultaneously taken into account in the design process in an attempt to combine as many steps as possible in the design sequence. The algorithm of a vector, matrix product is utilized since it forms the operational bases of linear recursive filtering and similar practical engineering computations. The design is minimized to system cost and constrained to time of completion, system power consumption, and system circuit board area. The concept of optimization is used at a modular level and at a circuit design level in an attempt to optimize the system throughout. Dissert. Abstr.

DATA DETECTION IN HIGH DENSITY DIGITAL MAGNETIC RECORDING Ph.D. Thesis
Hossein Mohamad Moghadam 1979 153 p
Avail: Univ. Microfilms Order No. 8003803

A generalized read system which combines several features in order to significantly increase probability of detection is designed. Signal equalization in conjunction with a peak-follower qualifying channel, followed by a phase coherent matched filter are the key elements of the design. The concept of a real time majority decoder, in the block diagram form, is introduced and

discussed. This concept utilizes three differently processed channels resulting in a certain degree of uncorrelation among them. The outcome is determined by a majority decode logic.

HC A04/MF A01 CSCL 05/2

The design, implementation, and performance analysis of a database management system implemented using abstract data types are presented. The use of abstract data types as an implementation tool is shown to have several significant advantages over current implementation techniques. First, by using a combination of abstract data types and generic procedures to structure the design of a database system, the resulting software will be more reliable. Also, by employing a programming language which supports specification and verification of abstract data types, we can guarantee data independence. Finally, we demonstrate that the application of abstract data types permits the elimination of run-time interpretation of the schema and subschema such as in IBM's IMS, Univac's DMS110, and INGRES. Instead, the data manipulation routines, which are shown to be examples of generic procedures, are implemented as parameterized calls to the procedures bound to the instances of the three abstract data types used to represent the logical structure of the database.

FORMAL METHODS AND HUMAN FACTORS IN THE DESIGN OF INTERACTIVE LANGUAGES Ph.D. Thesis
Andrew Jay Singer 1979 202 p
Avail Univ Microfilms Order No. 8004989

An approach to the design of interactive languages is presented which focuses on the problems of human engineering and complete definition for these languages. First, an approach which stresses user concerns and employs a detailed rationale to provide a basis for extracting human factors data is demonstrated in the design of an interactive 'assistant' for PASCAL programmers. Then, a method for completely describing interactive languages is developed in which interactive behavior is described using transition diagrams augmented by a semi-formal notation inspired by production systems. Finally, the framework of a complete semi-formal definition for the assistant is presented. The approach stresses the importance of details in the design process. Dissert. Abstr.

SYMBOLIC EXECUTION OF FORMAL MACHINE DESCRIPTIONS Ph.D. Thesis
John Denniston Oakley 1979 168 p
Avail Univ Microfilms Order No. 7925022

The noteworthy problems of machine symbolic execution were investigated. A rigorous method was developed for symbolically evaluating algebraic-like expressions defined over the domain of variable length bit strings. A mixed integer/bit string representation was devised which permitted the elimination of superfluous bit lengths (by conversion to an integer valued expression); non-superfluous bit lengths were represented explicitly. A formal proof was given of the equivalence of this mixed representation with the original. Appropriate simplification techniques were introduced. Other accomplishments and observations as well as the results are reported. Dissert. Abstr.

N80-18741 Massachusetts Univ., Amherst
STUDIES IN IMAGE SEGMENTATION ALGORITHMS BASED ON HISTOGRAM CLUSTERING AND RELAXATION Ph.D. Thesis
Paul Alexander Nagin 1979 179 p
Avail Univ Microfilms Order No. 8004968

The algorithms and structures that are sufficient to generate an accurate description of the information contained in a relatively complex class of digitized images are discussed. Some of the problems typically encountered in segmentation are explored. An algorithm is presented that avoids most of these problems. A series of computer generated test images with known characteristics are reported. Segmentation algorithms of varying degrees of complexity are applied to each image and their performance is carefully evaluated. It is shown that even the most sophisticated algorithms often perform poorly when confronted with certain apparently simple images. It is also shown that techniques which rely on histogram clustering often generate gross segmentation errors due to overlap in the distributions of the individual objects in a scene. Dissert. Abstr.

N80-18742 Syracuse Univ., N. Y.
LINEAR AND ALMOST-LINEAR METHODS FOR THE UNIFICATION OF FIRST ORDER EXPRESSIONS Ph.D. Thesis
Neil Vincent Murray 1979 137 p
Avail Univ Microfilms Order No. 8004511

Two techniques for rapid construction of stable equivalence relations are discussed. These techniques give rise to two classes of algorithms, having almost-linear and linear complexity. A published linear algorithm is shown to be incorrect and possibly not linear, and a correct linear algorithm is given. It is shown that the almost-linear algorithms can operate on graphs having fewer directed arcs than graphs suitable for linear algorithms. An interesting development arising from the study of equivalence handling is that under certain restrictions the equivalence problem can be done in linear time and space. The two abstract algorithms discussed were implemented in ALGOL W. Brief experiments conducted to compare their running times showed that the almost-linear algorithm runs faster than the linear one throughout the entire range of input sizes generated. Dissert. Abstr.

N80-18743 Syracuse Univ., N. Y.
ANALYSIS OF FUTURE EVENT SET ALGORITHMS FOR DISCRETE EVENT SIMULATION Ph.D. Thesis
William Michael McCormack 1979 271 p
Avail Univ Microfilms Order No. 8004510

The analytical and empirical results for the performance of algorithms proposed to implement the future event set in discrete event simulation are reported. These results provide a clear insight to the factors affecting algorithm performance, permit evaluation of the hold model often used to study future event set algorithms; and determine the best algorithm(s) to use. A number of theorems are given on the effect that scheduling distributions have on performance. A classification of distributions is established for efficient insertion scanning of a linear structure. The most significant results concern the effect of more than one scheduling distribution being present, as is typical of most simulations. Dissert. Abstr.

COMPUTATIONAL COMPLEXITY OF REAL FUNCTIONS AND POLYNOMIAL TIME APPROXIMATIONS Ph.D. Thesis
Ker-I Ko. 1979. 181 p.
Avail: Univ. Microfilms. Order No. 8001765.

Recursive analysis, the theory of computation of functions on real numbers, was studied from various aspects. The computational complexity of real functions using the methods of recursive function theory was investigated. Partial recursive real functions were defined and their domains were characterized as the recursively open sets. The time complexity of recursive real continuous functions were defined and it is shown that the time complexity and the modulus of uniform continuity of a function are closely related. The complexity of the roots and the differentiability of polynomial time computable real functions were studied. The concept of nondeterministic computation was used to study the complexity of the integrals and the maximum values of real functions. Dissert. Abstr.

N80-18747 University of Southwestern Louisiana, Lafayette.
A METHODOLOGY FOR FREE FORMAT SYSTEMS DESIGN Ph.D. Thesis
Edwin David Hoover. 1979. 242 p.
Avail: Univ. Microfilms. Order No. 8002713.

A system that implements a free form methodology is presented that provides an analyst with an automated technique designed specifically for the planning and design phase. The system utilizes a top down, structured approach comprised of a feasibility phase, detail design phase, and a task specifications phase. The system insures that the design is consistent with management's established objectives and that the individual tasks mesh to obtain the desired goals. Results indicate that with little or no training any analyst may begin using the system. Dissert. Abstr.

N80-18748 Cornell Univ., Ithaca, N. Y.
TOPICS IN COMPUTATIONAL COMPLEXITY Ph.D. Thesis
Steven Jonathan Fortune. 1979. 130 p.
Avail: Univ. Microfilms. Order No. 8003924.

The problem of determining a homeomorphic embedding of a pattern graph in a target graph is described. The case where both pattern and target graphs are directed is considered. For pattern graphs which are essentially trees of height one, a polynomial time algorithm is given; for all other pattern graphs the problem is NP-complete. The problem of determining the two closest of n points, where the points are given by their coordinates in a k-dimensional Euclidean space is stated and it is shown that there is an obvious O(n2) algorithm for the problem: compare every pair of points. The termination properties for languages with various type structures are evaluated using versions of the gamma-calculus. The independence result for the polymorphic programming language is a consequence of the ability to represent in the polymorphic gamma-calculus all the computable functions which are provably recursive in Peano Arithmetic. Dissert. Abstr.

DESIGN OF A VERIFIABLE SUBSET FOR HAL/S Final Report
James C. Browne, Donald I. Good, Anand R. Tripathi, and William D. Young. 31 Dec. 1979. 264 p.
(Contract NAS9-13864)
(NASA-CR-162814) Avail: NTIS. HC A12/MF A01. CSCL 09B.

An attempt to evaluate the applicability of program verification techniques to the existing programming language, HAL/S is discussed. HAL/S is a general purpose high level language designed to accommodate the software needs of the NASA Space Shuttle project. A diversity of features for scientific computing, concurrent and real-time programming, and error handling are discussed. The criteria by which features were evaluated for inclusion into the verifiable subset are described. Individual features of HAL/S with respect to these criteria are examined and justification for the omission of various features from the subset is provided. Conclusions drawn from the research are presented along with recommendations made for the use of HAL/S with respect to the area of program verification. A.W.H.

PORTABILITY OF LARGE COBOL PROGRAMMERS: THE COBOL PROGRAMMER'S WORKBENCH Final Technical Report, 25 Nov. 1976 - 30 Jun. 1979
P. H. Enslow. Sep. 1979. 286 p. refs.
(Grant DAAG29-77-G-0045)
(AD-A076917; GIT-ICS-79-09; ARO-14752.1-A-EL) Avail: NTIS. HC A13/MF A01. CSCL 09/2.

The COBOL Programmer's Workbench is a fully integrated

collection of automated software tools designed to substantially aid in the design, implementation, test, and maintenance of COBOL data processing systems, especially those that must run on a variety of target host operating environments. The Workbench also assists in the preparation and maintenance of all supporting documentation. One of the most important capabilities of the Workbench is the automatic preparation of a set of equivalent but compiler-unique versions of a baseline program that has been written in Workbench COBOL. The research here included an investigation of the problems of converting a baseline program into compiler-unique versions, an initial study of the use of reuseable modules in-line COBOL code, a limited feasibility demonstration of these capabilities, and a preliminary study for the design of COBOL. STUDY OF SYMBOLOGY FOR AUTOMATED GRAPHIC DISPLAYS Technical Report, 11 May 1977 - 11 May 1978
Peter W. Hemingway, Albert L. Kubala, and Garvin D. Chastain May 1979 65 p refs
(Contract DAHC19-75-C-0025; DA Proj. 2Q7-63743-A-775)
(AD-A076916; HUMRRO-FR-WD-TX-78; ARI-TR-79-A18) Avail: NTIS HC A04/MF A01 CSCL 05/8

The primary purpose of this report is to describe the current status of symbology development for use in interactive graphic display systems such as the Command and Control Interactive Display Experimentation System (CCIDES). A secondary purpose is to examine user requirements for such systems when employed as a part of a Tactical Operations System (TOS). An extensive literature survey indicated a great variety of available alternative symbology formats. Before a specific format is selected, the necessary information requirements for a particular position must be determined. For Army tactical displays, this information should be gathered in experiments using realistic battle scenarios. As a related effort, alternative symbol formats were evaluated by civilians. Naive subjects generally preferred a pictorial symbol over traditional military alternatives. The report is written for a military audience. GRA

A COLUMN GENERATION TECHNIQUE FOR THE COMPUTATION OF STATIONARY POINTS
Jong-Shi Pang Oct. 1979 30 p refs
(Contract N00014-75-C-0621)
(AD-A076415; MSRR-447; WP-29-79-80) Avail: NTIS HC A03/MF A01 CSCL 12/1

In two recent papers, Eaves showed that Lemke's algorithm can be used to compute a stationary point of an affine function over a polyhedral set. This paper proposes an alternative method which is based on parametric principal pivoting. The proposed method involves solving systems of linear equations and parametric linear subprograms over the given polyhedral set. An obvious advantage of the method is that any special structure of the polyhedral set can be exploited profitably in the solution of the subprograms. GRA

APPLICATIONS OF STOCHASTIC MODELS FOR IMAGE DATA COMPRESSION
Sheng-Huey Wang (Picker Corp., Mayfield Village, Ohio) and Anil K. Jain Sep. 1979 257 p refs
(Grant DAAG29-78-C-0206)
(AD-A078781; ARO-16222.3-EL) Avail: NTIS HC A12/MF A01 CSCL 09/4

Intraframe image data compression systems are analyzed in this thesis using stochastic modeling concepts. The formulations of stochastic image models are obtained from different classes of partial differential equations. Their application to the coding problem shows the connection between predictive, hybrid and transform coding schemes. The resulting coding schemes are evaluated in terms of tangible system terms such as signal to noise ratio, mean square error and rate distortion curve. GRA

CONJUGATE-GRADIENT METHODS FOR LARGE-SCALE NONLINEAR OPTIMIZATION
Phillip E. Gill and Walter Murray Oct. 1979 65 p refs Presented at the 24th Intern. Meeting of the Inst. of Management Sci., Hawaii, Jun. 1979
(Contracts DAAG29-79-C-0110; DE-AS03-76SF-00326; Grants NSF MCS-76-20019; NSF ENG-77-06761)
(AD-A078713; SU-SOL-79-15; ARO-16470.1-M) Avail: NTIS HC A04/MF A01 CSCL 12/1

In this paper we discuss several recent conjugate-gradient type methods for solving large-scale nonlinear optimization problems. We demonstrate how the performance of these methods can be significantly improved by careful implementation. A method based upon iterative preconditioning will be suggested which performs reasonably efficiently on a wide variety of significant test problems. Our results indicate that nonlinear conjugate-gradient methods behave in a similar way to conjugate-gradient methods for the solution of systems of linear equations. These methods work best on problems whose Hessian matrices have sets of clustered eigenvalues. On more general problems, however, even the best method may require a prohibitively large number of iterations. We present numerical evidence that indicates that the use of theoretical analysis to predict the performance of algorithms on general problems is not straightforward. GRA

GUIDE TO VECTORIZATION ON THE NAVAL RESEARCH LABORATORY'S TEXAS INSTRUMENTS ADVANCED SCIENTIFIC COMPUTER. VOLUME: VECTORIZATION PRIMER
Barbara Brooks, Harvey Brock, and Max Miller (Texas Univ. at Austin) 13 Nov. 1979 26 p refs
(AD-A077365; NRL-MR-4102-Vol-1) Avail: NTIS HC A03/MF A01 CSCL 12/1

The Vectorization Primer is for programmers newly using the Texas Instruments Advanced Scientific Computer (ASC) and it is for managers, scientists, and programmers who are contemplating the ASC. The concept of vectorization is introduced

and illuminated. Fundamental principles and basic programming techniques for achieving vectorization are presented. Problems and pitfalls that FORTRAN programmers, new to the ASC, encounter in writing and vectorizing FORTRAN programs are discussed. This information is useful to the potential ASC user for weighing the benefits of vectorization against the costs of vectorization in programming effort. This information assists the new ASC programmer in mastering concepts and techniques for vectorization. It guides him/her around irksome pitfalls. Volume 2 of the Guide to Vectorization on the Naval Research Laboratory's Texas Instruments Advanced Scientific Computer is for experienced ASC programmers. Advanced vectorization techniques, examples, and considerations are presented. GRA

THE DESIGN OF DEADLOCK- AND LIVELOCK-FREE PACKET SWITCHING NETWORKS Ph.D. Thesis
Sam Toueg. 1979. 88 p.
Avail: Univ. Microfilms. Order No. 8005282

Several types of deadlock free uniform local flow control procedures (controllers) that prevent store and forward deadlocks in any packet switching network are presented. These local controllers are executed independently by each node in a network, using only local information readily available to these nodes. Several properties of the proposed deadlock-free uniform controllers, as well as their relationship, are given, and a proof of their optimality with respect to deadlock-free uniform controllers using the same local information is presented. A deadlock- and livelock-free local controller is described which guarantees that every packet reaches its destination within a finite amount of time from the moment of its creation. Dissert. Abstr.

N80-18764 Ohio State Univ., Columbus.
INTERPROCESS COMMUNICATION AND SYNCHRONIZATION FOR DISTURBED SYSTEMS Ph.D. Thesis
Roberto Pardo. 1979. 242 p.
Avail: Univ. Microfilms. Order No. 8001800

Strategies for routing multi destination messages, mainly in local architectures are developed. The exchange of multi destination messages deals with the design of several protocols at various levels that ensure different degrees of reliability. The levels considered are: (1) unreliable level, where the protocol implements process addressing and chooses the best multi destination routing algorithm; (2) best effort to deliver level, where the protocol attempts to deliver the message to as many of its destinations as possible, filtering duplicates and out of order messages at each destination; and (3) guarantee to deliver level, where the protocol ensures that every destination will receive the message, regardless of momentary unavailability due to communication or processing system failures. Dissert. Abstr.

A COMPREHENSIVE APPROACH TO THE PERFORMANCE MEASUREMENT AND EVALUATION OF LARGE-SCALE COMPUTER SYSTEMS Ph.D. Thesis
Herbert Walker Merrill, Jr. 1979. 66 p.
Avail: Univ. Microfilms. Order No. 8004228

The performance measurement and evaluation of large scale computer systems do not require hardware and software monitors as data collectors, but rather a comprehensive approach is described which uses only the computer system's accounting file as the data source. This data is processed into a performance data base which is the primary tool of this approach, and it is used to establish meaningful and measurable performance objectives. The objectives for service are related to resource consumption by a charging scheme that charges a higher price for better service, and thus capacity measures (for equipment acquisition or release) relate directly to qualitative and quantitative measures of user satisfaction versus supplier's costs. The implementation of the performance data base is described and the development of specific objectives for several systems (batch, interactive) is described. Examples of the capacity measures are shown, and several examples of the simplicity, cost-effectiveness and utility of the approach are described. Dissert. Abstr.

ANALYSIS OF NEW PROTOCOLS FOR COMPUTER COMMUNICATION NETWORKS Ph.D. Thesis
Clifford John Warner. 1980. 287 p.
Avail: Univ. Microfilms. Order No. 8002630

An advanced forward area tactical radar network, now under conceptual development by the Air Force Electronic Systems Division, can be viewed as a novel form of computer network but with other unique problems resulting from the specialized nature of the application. The proposed network will link together a number o short-range radars, each with associated data processing equipment, so that each radar site has a complete file of tracks for all targets seen by any radar in the network. In addition, the communication network is expected to be used for transmission of a variety of other types of command and control messages. A new class of adaptive routing protocols for computer communication networks has been developed in this thesis, using the radar network as a basis, but applicable to any computer communication network. These new routing protocols utilize new techniques for searching out and using both reciprocal paths (paths over which messages can travel in either direction) and nonreciprocal paths (paths over which messages can travel in only one direction) for directed message routing. The computations required by the new routing protocols are carried out in a distributed manner at each network node. Dissert. Abstr.

A TRUTH MAINTENANCE SYSTEM
Jon Doyle. Jun. 1979. 47 p. refs.
(Contract N00014-75-C-0643; Grant NSF MCS-77-04828)
(AD-A078419; AI-M-521) Avail: NTIS. HC A03/MF A01. CSCL 05/8

To choose their actions, reasoning programs must be able to make assumptions and subsequently revise their beliefs when discoveries contradict these assumptions. The Truth Maintenance System (TMS) is a problem solver subsystem for performing these functions by recording and maintaining the reasons for program beliefs. Such recorded reasons are useful in constructing explanations for program actions and in guiding the course of action of a problem solver. This paper describes (1) the representations and structure of the TMS, (2) the mechanisms used to revise the current set of beliefs, (3) how dependency-directed backtracking changes the current set of assumptions, (4) techniques for summarizing explanations of beliefs, (5) how to organize problem solvers into 'dielectically arguing' modules, (6) how to revise models of the belief systems of others, and (7) methods for embedding control structures in patterns of assumptions. We stress the need of problem solvers to choose between alternate systems of beliefs, and outline a mechanism by which a problem solver can employ rules guiding choices of what to believe, what to want, and what to do. CONNECTED COMPONENT LABELING USING QUADTREES
Hanan Samet. Apr. 1979. 30 p. refs.
(Contract DAAG53-76-C-0138; DARPA Order 3206)
(AD-A076130; CSC-TR-756) Avail: NTIS. HC A03/MF A01. CSCL 05/8

An algorithm is presented for labeling the connected components of an image represented by a quadtree. The algorithm proceeds by exploring all possible adjacencies for each node once and only once. Once this is done, any equivalences generated by the adjacency labeling phase are propagated. Analysis of the algorithm reveals that its worst case average execution time is bounded by a quantity proportional to the product of the log of the region's diameter and the number of blocks comprising the area connected by the components. In Quantitative Feedback Synthesis, bounds on plant uncertainty and on the system performance are specified a priori. The minimum feedback is used which satisfies the latter over the range of plant uncertainty. The principal effort during the past year was in extending Quantitative Feedback Synthesis to two new highly complex, multiple-loop, single input-output plant structural classes. The significant advantage of multiple-loop over single-loop is that, in highly uncertain systems, the same performance specifications can be satisfied, with tremendously smaller sensor noise effects. A technique denoted as 'Design Perspective' was developed, which enables the designer to evaluate the trade-offs without a detailed design. Thus, early in the game and before doing a detailed design, the designer can obtain an excellent idea of which loops (sensors) to use and which to omit and the portion of the 'feedback burden' to assign to each loop. The same design techniques are applicable to highly uncertain nonlinear plants with the same structure. Several complex detailed design examples with very large uncertainty were done. Design perspective results were very close to the final design results. The designs were simulated on the digital computer and in all cases satisfied the a priori assigned performance specifications. OPTIMAL DISCOUNTED LINEAR CONTROL OF THE WIENER PROCESS Interim Report
Icannis Karatzas. Sep. 1979. 18 p. refs.
(Grant AF-AFOSR-3063-77; AF Proj. 2304)
(AD-A078487; AFOSR-79-1249TR) Avail: NTIS
HC A02/MF A01 CSCL 12/1

We consider the problem of discounted optimal control of the Wiener process, transformed by the action of a nonanticipative control into the state process. The latter satisfies the state equation on an appropriate probability space. There is a cost per unit time for being in the wrong state which is an even, uniformly convex function on the reals whose second derivative is decreasing with distance from the origin. There is also a cost per unit time for using the control. Both costs are discounted in time by a factor and the control action is limited. The controller has to choose a law as a nonanticipative, measurable functional of the state process with values so as to minimize the expected discounted total cost. In the present paper we proceed by formulating the control problem. The Bellman equation of dynamic programming is explicity solved and the candidate for the optimal law is discerned from the properties of the solutions. Optimality of the candidate is proved. GRA

HC A03/MF A01 CSCL 12/1

This report discusses the problem of dynamic optimal investigation of a two-state (in control, out of control) system. The true state can only be inferred from reported costs and the time since the last correction. It is demonstrated that when the parameters satisfy certain conditions, such problems can be efficiently solved as regenerative stopping problems. Some general results for regenerative stopping problems are also obtained. In the last section the problem is generalized to n two-state systems. By combining simulation with the Regenerative Stopping Algorithm, a problem with 20 state variables is solved with a small error term. GRA

HC A02/MF A01 CSCL 12/1

The investigation has continued in the use of information theory and in particular rate distortion theory to derive useable upper and lower bounds on the expected loss for the nonlinear filtering problem. A new design criterion has been derived which leads to effective designs of large systems when the entire state is not available for feedback control. Preliminary results have been obtained on the problem of absolute phase demodulation. New results which evaluate the information loss which results from use of the classical phase lock loop instead of the optimal demodulator, have been obtained and are being investigated. INCOMPLETE BLOCK DESIGNS FOR COMPARING TREATMENTS WITH A CONTROL. 3: OPTIMAL DESIGN FOR p = 4, k = 3 AND p = 5, k = 3
Robert E. Bechhofer and Ajit C. Tamhane (Northwestern Univ.). Oct. 1979. 27 p. refs.
(Contracts DAAG29-77-C-0003; N00014-75-C-0586; Grant NSF ENG-77-06112)
(AD-A078331; TR-436) Avail: NTIS HC A03/MF A01 CSCL 12/1

This paper continues the study of balanced treatment incomplete block (BTIB) designs. The definitions of inadmissibility and strong inadmissibility are generalized. The search for optimal designs is restricted to the smaller class of admissible designs obtained using these new definitions. Lists of generator designs, the (conjectured) complete class of generator designs, catalogs of admissible designs, and tables of optimal designs are given for p = 4, k = 3 and p = 5, k = 3. GRA

OPTIMAL CONTROL OF SYSTEMS WITH UNCERTAINTY Interim Report, Sep. 1978 - Aug. 1979

W. E. Schmitendorf. 1979. 91 p. refs.

(Grant AF-AFOSR-2423-76; AF Proj. 2304)

(AD-A078433; AFOSR-79-1257TR) Avail: NTIS HC A05/MF A01 CSCL 12/1

The first problem considered was that of steering a system without disturbances to the origin when the magnitude of the control is constrained. A technique was developed for determining if a system can be steered to the origin and also a method for obtaining such a control when it exists. Next, the controllability problem was generalized by allowing for targets other than the origin. To reduce computational capability, a method was developed which exploits the affine nature of the target and requires the solution of a smaller dimensional optimization problem. One other area which has been under investigation is that of avoidance control. The controllability problem for systems with disturbances is being investigated. Research is also continuing on controllability of systems without disturbances. Work is also in progress on the avoidance control problem as well as the closely related holding problem. GRA

INCOMPLETE BLOCK DESIGNS FOR COMPARING TREATMENTS WITH A CONTROL. 1: GENERAL THEORY

Robert E. Bechhofer and Ajit C. Tamhane. Mar. 1979. 36 p. refs.

(Contracts DAAG29-77-C-0003; N00014-75-C-0586; Grant NSF ENG-77-06112)

(AD-A078330; TR-414) Avail: NTIS HC A03/MF A01 CSCL 12/1

This is the first paper of a series in which we outline a theory of optimal incomplete block designs for comparing several treatments with a control, and give plans of optimal designs to use for this purpose. In the present paper we develop the basic theory of the incomplete block designs which are appropriate for the many-to-one comparisons problem; the optimality considerations for such designs will be addressed in subsequent papers. For this problem we propose a new general class of incomplete block designs which are balanced with respect to test treatments. We shall use the abbreviation BTIB to refer to such designs. We study their structure, and give some methods of construction. A procedure for making exact joint confidence statements for our multiple comparisons problem is described. Using a new concept of admissibility of designs, it is shown how 'inferior' designs can be eliminated from consideration. Some open problems concerning construction of BTIB designs are posed. GRA

A FUNCTIONAL EXPANSION APPROACH TO THE SOLUTION OF NONLINEAR FEEDBACK PROBLEMS Interim Report

Ram-Nandan P. Singh (Mitre Corp., McLean, Va.) and Timothy L. Johnson. Aug. 1979. 24 p. refs.

(Grant AF-AFOSR-3281-77; AF Proj. 2304)

(AD-A077408; LIDS-P-796-A; AFOSR-79-1189TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

The application of a functional expansion technique introduced by Bellman to the determination of nonlinear optimal control laws is described. For a certain class of 'smooth' control problems, it is demonstrated that convergence of the expansion technique may be improved by use of a nonlinear (rather than linear) auxiliary equation which is based on a known cost-to-go function for an associated 'linear-quadratic' optimal control problem. GRA

PARTIALLY OBSERVED STOCHASTIC CONTROL SYSTEMS

Wendell H. Fleming and Etienne Pardoux. 1979. 4 p. refs.

(Grants AF-AFOSR-3063-77; NSF MCS-76-07261; AF Proj. 2304)

(AD-A078290; AFOSR-79-1166TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

In this paper, the authors are concerned with the existence of optimal controls for problems. The method depends on introducing another stochastic control problem which is called a 'separated' problem. For several years the question of proving a general theorem about existence of optimal controls in the strict sense has been open. The authors do not obtain such a result here. However, they obtain an existence theorem in which a somewhat wider class of control processes is admitted. GRA

NUMERICAL METHODS AND APPROXIMATION AND MODELLING PROBLEMS IN STOCHASTIC CONTROL THEORY Final Report, 1 Jul. 1978 - 30 Jun. 1979

Wendell H. Fleming and Harold J. Kushner. 15 Aug. 1979. 8 p. refs.

(Grant AF-AFOSR-3063-76; AF Proj. 2304)

(AD-A078288; AFOSR-79-0972TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

Many areas of stochastic control were studied in this period. Monte Carlo algorithms of type appearing in adaptive systems were studied and stability, convergence and rate of convergence results obtained. The analytical techniques developed for this purpose have a wide applicability in the study of similar algorithms. Robust computationally oriented approximations to optimal non-linear filters were developed. A deep study of how to find the Markov system that best approximates a given non-linear system with a wide band-width input was undertaken and very good results obtained. The problem is important in control and communication theory because it is usually desired to use the many available methods for analyzing Markov systems. The results obtained seem to be the best available so far and application to control and communication theory are being pursued. Optimal stochastic control problems under the condition of partial information on the system state were studied and a new formulation, similar to that of the non-linear filtering problem, developed. The approach seems promising in providing qualitative information on this difficult class of problems. Part of the technique uses measure-valued processes in a way which has wider applicability to problems involving distributed states or information. GRA

APPLICATION OF DIGITAL TECHNOLOGY TO GUIDANCE AND CONTROL THEORY Technical Report, 1 Aug. - 30 Sep. 1979

S. M. Seltzer. 30 Sep. 1979. 21 p. refs.

(Contract DAAK40-79-C-0213)

(AD-A078815; CDC-79-3) Avail: NTIS HC A02/MF A01 CSCL 12/1

The purpose of the study reported upon herein is to investigate the potential existence of a clustering of system poles and zeros in the z-domain. This potential is shown to exist. A means of separating the clustering is proposed by mapping from the complex z-domain onto the complex w-domain. The reason for so-doing is to ameliorate computational difficulties that can arise as the result of closely clustered roots. GRA

OPTIMAL CONTROL PROBLEMS WITH DISCRETE TIME, LINEAR DYNAMICS, AND CONVEX STATE-CONTROL CONSTRAINTS Ph.D. Thesis - Helsinki Univ.

Eero Tamminen. 1979. 49 p. refs. Sponsored by Emil Aaltonen Foundation

(VTT-ENT-26; ISBN-951-38-0797-5) Avail: NTIS HC A03/MF A01

The assumptions about the structure and the elements of optimal control problems are defined. The original problem is

converted into an equivalent Lagrangian optimization problem. The functional analytic approach of Dubovitskij and Milyutin is applied to the Lagrangian problem and necessary conditions for optimality are derived for the original problem in the form of a maximum principle. In the time-point-wise Hamiltonian minimization problems, which give the optimal control, explicit state-control constraints are presented. The driving Lagrange multiplier vector in the adjoint state equations is characterized as the solution to the optimization problem which is the dual of the Hamiltonian problem. Owing to the convexity assumptions, the maximum principle is also a sufficient condition for optimality. The possibility of avoiding singular solutions by reformulating state constraints into state-dependent control constraints is treated. The maximum principle leads to a two-point boundary value problem. An iterative scheme for solving this problem is considered. Author (ESA)

STABILITY CONSIDERATIONS FOR VOLTERRA INTEGRO-DIFFERENTIAL EQUATIONS Ph.D. Thesis
Leigh Carl Becker 1979 82 p
Avail: Univ. Microfilms Order No. 8004027

The basic stability properties of the equation x prime (t) = A(t)x(t) + the integral from 0 to t of C(t,u)x(u)du + f(t) are considered, where A and C are continuous n by n matrices, f is a continuous n-vector-valued function, and x is an n-vector. A solution is expressed in terms of the solutions of an associated family of homogeneous equations via a variation of parameters formula. Stability results for the associated family when A(t) is identically equal to A, a constant stable matrix, are obtained in terms of a symmetric positive definite matrix. When f(t) is identically equal to 0, necessary and sufficient conditions are obtained for uniform stability, uniform asymptotic stability, and exponential asymptotic stability. These results coupled with the variation of parameters formula yield some perturbation results. Dissert. Abstr.

COMPLEMENTATION, REGULARITY AND CONVERGENCE OF MEASURES IN BANACH SPACES GENERATED BY QUANTUM LOGICS Ph.D. Thesis
Olga Rozinak Beaver 1979 71 p
Avail: Univ. Microfilms Order No. 8004896

Assuming that a quantum logic, 2, carries a sufficiently large collection of states, the collection is embedded as base for a base-norm space S. Then 2 can be embedded in the order-unit Banach dual S* of S and the base-norm Banach dual S** of S* consists of functions which, restricted to 2, are finitely additive. It is shown that if the collection of states is regular with respect to a particular subset P of 2, then each function in S** can be decomposed into countably additive and purely finitely additive parts. It is further shown that weak compactness of sets of functions in S can be determined by the behavior of the functions either on certain maximal lattice subsets of S*, or on P if the collection of states is P-regular. Finally, criteria are established under which a closed subspace of S* is not topologically complemented in S*. Dissert. Abstr.

STABILITY THEORY FOR MATHEMATICAL PROGRAMMING PROBLEMS WITH UNBOUNDED CONVEX FEASIBLE REGIONS: A POINT-TO-SET SUBMAP APPROACH Ph.D. Thesis
Robert Grover Batson 1979 39 p
Avail: Univ. Microfilms Order No. 8004529

The stability is examined of mathematical programming problems when the resource vector associated with the constraints is perturbed. Using classical decomposition theorems. A line-free unbounded closed convex feasible region is written as the sum of the convex hull of its extreme points plus its recession cone. The regularity assumption is that the recession cones of the feasible regions are constant on a neighborhood of the original resource vector b. When the resource vector is varied, the convex hull of extreme points (the basic hull) becomes a submap of the feasible region point-to-set map. It is assumed that the basic hull is compact at b and base our analysis on semicontinuity properties of the basic hull at b. The optimal value is a function of the resource vector used to pose the problem. Stability is defined as the continuity of this optimal value function at b. Such continuity is significant for duality theory and in the practice of operations research. Sufficient conditions for continuity, and also for linear continuity of v at b are the major findings. Dissert. Abstr.

COALESCING BROWNIAN MOTIONS ON THE LINE Ph.D. Thesis
Richard Alejandro Arratia 1979 134 p
Avail: Univ. Microfilms Order No. 8001124

Coalescing Brownian motions on the real line R are defined and analyzed. This system is the continuous space analog of coalescing random walks on the lattice of integers Z. The system is constructed with arbitrary initial sets of particles. The system has an invariant equilibrium measure, a point process on R called pi sup c. A duality relation for the system of coalescing Brownian motions makes it possible to express the zero function of pi sup c in terms of finite systems of annihilating Brownian motions. Using coalescing Brownian motions, the limiting behavior of some nearest neighbor interaction particle systems on the one dimensional lattice Z, such as coalescing random walks, annihilating random walks, and the basic voter model can be analyzed. Dissert. Abstr.

PROJECTIVE NORMALIZATION OF SURFACES WITH A FIXED HILBERT POLYNOMIAL Ph.D. Thesis
Carola AndujoRolon 1979 32 p
Avail: Univ. Microfilms Order No. 8002414

Let P(x) be a rational polynomial such that P(m) is an integer for every integer m. Let V be a projective surface defined over an algebraically closed field k and C sub V a generic hyperplane section over k. Let Sigma be the set of pairs (V, Cv) with a fixed Hilbert polynomial P(m) = chi(V, L(mC sub V)). The aim is to prove that there is a constant M sub O depending only on the Hilbert polynomial chi(V, L(mC sub V)) such that for m greater than M sub O the linear system (mC sub V) defines a birational morphism 1/gamma for which gamma(V) is projectively normal. Associate to every pair (V, Cv) a pair (V*, C*), where f:V* - V is the desingularization of V and C* is the pull back f-1(Cv). By Bertini's theorem it is concluded that C* is an absolutely irreducible curve. (C*)(2) (C*)(2) = (C sub V)(2) greater than 0 and I(C*, Y) equal to or greater than 0 for every positive divisor Y on V*. The idea is to use some results which are known for non-singular surfaces to prove the existence of an integer M sub O, independent of the choice of V, that is, depending only on the Hilbert polynomial such that the minimal sum of the linear systems A(C*) and A(mC*) is complete for M equal to or greater than M. Dissert. Abstr.

THE CLASS NUMBER OF AN ALGEBRAIC NUMBER FIELD: ITS INTERPRETATION AND USE Ph.D. Thesis
Herbert Emil Kasube 1979 96 p
Avail: Univ. Microfilms Order No. 8002330

The history of algebraic number theory is examined. The definitions of ideal numbers and ideals for the algebraic number field K are reviewed. Kummer's theory of ideal numbers for K is used to develop an interpretation of the class number of K and to explain how small class numbers suggest that the integers of the field are close to being uniquely factorable. Background material is presented to interpret the vocabulary needed for the interpretation. The class number is shown to be useful in studying Fermat's last theorem. The application of the computer in studying the class number and connected topics such as Fermat's last theorem is discussed. Dissert. Abstr.

A HEYTING ALGEBRA BESTIARY, TERTIUM DAMUS Ph.D. Thesis
Samuel Bishop Johnson 1979 176 p

Avail: Univ. Microfilms Order No. 8003627

The concept of a Heyting algebra which is a generalization of the concept of a Boolean algebra is discussed. The definitions and facts of Heyting algebra are reviewed. Results concerning the structure of Heyting algebras, their varieties, and their relation to topoi are established. Four major results are established: (1) the free Heyting algebra on one generator is analyzed; (2) it is shown that the lattice of varieties of Heyting algebras contains a sublattice isomorphic to the lattice of all subsets of the natural numbers; (3) through construction of the appropriate topos it is shown that each Boolean algebra appears as the subobjects of the terminator in some value based topos; (4) the free Heyting algebra on two generators is shown to appear as the subobjects of the terminator in no value based topos. Dissert. Abstr.

N80-18799 Florida Univ., Gainesville.
ON DISCRETE METRICS AND BETWEENNESS RELATIONS Ph.D. Thesis
Edward Richard Howorka 1979 147 p
Avail: Univ. Microfilms Order No. 8002866

Classes of graphs G defined by conditions imposed on the metric or betweenness space associated with G are reported. It is shown that the class of integer valued metric spaces realizable in Husimi trees is characterized by a classical condition used often to describe the tree realizable metric spaces, the so called four point condition. Several other metric conditions satisfied by trees are considered, and the corresponding classes of graphs characterized. Distance hereditary graphs (graphs G whose connected induced subgraphs preserve the distance of G) are described in terms of their cycle and clique structure. Ptolemaic graphs (graphs whose associated metric space is ptolemaic) are shown to be distance hereditary. Several characterizations of ptolemaic graphs are given, and an operation is exhibited which generates finite ptolemaic graphs from complete graphs. Dissert. Abstr.

MANIFOLDS WITH GENERALIZED BOUNDARY AND DIFFERENTIAL SEMIGROUPS Ph.D. Thesis
George Erwin Graham 1979 79 p
Avail: Univ. Microfilms Order No. 8005125

The notion of a Frechet derivative is strengthened to apply to vector valued functions on subsets of Euclidean space with dense interior, and the possibility of extending differentiable functions is examined for certain special cases. The chain rule, inverse function theorem, and several other theorems from advanced calculus are established. The differential geometry is developed with emphasis on differentiable structures, the tangent bundle, products, vector fields, and the Lie bracket operation on vector fields. Differentiable semigroups are discussed. A differentiable semigroup is a semigroup S on an n-manifold with generalized boundary such that the multiplication function is differentiable. It is shown that if S has an identity, then the multiplication satisfies a cancellation law in a neighborhood of the identity. Dissert. Abstr.

K-UNIFORMLY CONVEX BANACH SPACES Ph.D. Thesis
Raymond Sylvester Geremia, Jr. 1979 116 p
Avail: Univ. Microfilms Order No. 8004693

Geometric properties of a Banach space which generalize uniform convexity was studied. These properties make use of notions of volume and area in a Banach space and it is shown that these notions are consistent with one's intuitions about volume and area. Results are shown for Banach spaces that are 2-uniformly convex or locally 2-uniformly convex. For spaces that are locally 2-uniformly convex it is shown that the concepts of norm and weak sequential convergence on the unit sphere are equivalent. It is also shown that the metric projection onto a closed and convex Chebyshev set is continuous in these spaces. Dissert. Abstr.

MULTIPHASE AVERAGING OF PERIODIC SOLITON EQUATIONS Ph.D. Thesis
Mark Gregory Forest 1979 293 p
Avail: Univ. Microfilms Order No. 8003057

The multiphase averaging of periodic soliton equations is considered. The periodic sine-Gordon equation and its associated inverse spectral theory are analyzed, including a discussion of the spectral representations of exact, N-phase sine-Gordon solutions. The physical characteristics of the periodic waves are emphasized with a motivation from the well-known whole-line solutions. A canonical Hamiltonian approach for the modulational theory of N-phase waves is prescribed. A concrete illustration of this averaging method is provided with the periodic sine-Gordon equation. For the KdV equation, very general results are given for multiphase averaging of the N-phase waves. Single-phase results are extended to general N phases, and more importantly, an invariant representation in terms of Abelian differentials on a Riemann surface is provided. Several consequences of this invariant representation are deduced, including strong evidence for the Hamiltonian structure of N-phase modulational equations. Dissert. Abstr.

N80-18803 Illinois Univ. at Urbana-Champaign.
SOME OPTIMAL AND NEAR-OPTIMAL LOW RATE ALGEBRAIC CONVOLUTION CODES Ph.D. Thesis
Robert Charles Eaker 1979 107 p
Avail: Univ. Microfilms Order No. 8004161

The algebraic structure of certain classes of convolutional codes and several classes of optimal or near optimal convolutional codes are presented. Classes of Abelian codes which are ideals in a group algebra are discussed. It is shown that these Abelian codes and their weight distribution play a fundamental role in the construction and analysis of convolutional codes. Dissert. Abstr.

CONVERGENCE THEOREMS FOR ABSTRACT ASYMPTOTIC MARTINGALES Ph.D. Thesis
Robert Wayne Smith 1979 88 p
Avail: Univ. Microfilms Order No. 8002899

Convergence theorems are derived for asymptotic martingales which take values in a locally convex topological vector space and for scalar valued asymptotic martingales which are integrable with respect to a measure which takes values in such a space. Basic concepts and terminology concerning asymptotic martingales of real valued random variables are established. Several convergence theorems are developed for weakly measurable Pettis integrable asymptotic martingales which take values in a locally convex topological vector space. Conditions which insure a discrete parametered asymptotic martingale converges are obtained almost everywhere in the weak topology as well as Conditions guaranteeing weak convergence in measure of a continuous parametered asymptotic martingale. Dissert. Abstr.

N80-18805 Oklahoma State Univ., Stillwater.
DIVISIBILITY IN 3-MANIFOLD GROUPS Ph.D. Thesis
Stephen Andrew Sedory 1979 69 p
Avail: Univ. Microfilms Order No. 8003600

The scope of study for this research is concerned with answering the following group theoretic question. Given a positive integer n and an element g in a group G, does there exist in G a solution to the equation Xn = g? The question is restricted to those groups which occur as the fundamental group of certain 3-manifolds. It is translated to a topological setting and there becomes the question of whether a given loop in a given manifold is freely homotopic to a power of some other loop. The geometric properties of the class of manifolds considered are exploited to answer this question. The findings and conclusions are that an algorithm is constructed which answers the above question for those groups occurring as the fundamental group of compact, orientable, irreducible, sufficiently large 3-manifolds which contain no essential annuli or tori in their entire hierarchy. The algorithm provides, for a given manifold M and loop l in M, a list of all those positive integers n for which l is freely homotopic to the nth power of some loop sigma sub n. Further, for each such n, the algorithm constructs such a loop sigma sub n. Dissert. Abstr.

MAXIMUM LIKELIHOOD ESTIMATION IN AUTOREGRESSIVE PROCESSES WITH MISSING OBSERVATION Ph.D. Thesis
Suan-Boon Tan 1979 90 p
Avail: Univ. Microfilms Order No. 8004879

Three methods are proposed for estimation in autoregressive processes when there are missing observations. These methods use a maximum likelihood approach and are based on the EM algorithm, the Newton-Raphson method, and the method of scoring applied to the likelihood equations. The resulting estimation equations are modified by excluding certain asymptotically negligible terms. Under suitable conditions on missing patterns estimates obtained from the Newton-Raphson method and the method of scoring are consistent, asymptotically normal and one-step asymptotically efficient if the initial estimates are consistent. Additionally, estimation in autoregressive moving average processes with missing observations is considered. Finally, extension to vector autoregressive moving average processes with missing observations is also discussed. Dissert. Abstr.

N80-18807 Rensselaer Polytechnic Inst., Troy, N. Y.
A MATHEMATICAL MODEL OF SPATIALLY LOCALIZED NEURAL SYSTEMS Ph.D. Thesis
James Richard Brannan 1979 122 p
Avail: Univ. Microfilms Order No. 8004755

A probabilistic model of a spatially localized, mutually excitatory (inhibitory) population of neurons is formulated. The state variable of a typical neuron within a densely interconnected population of neurons is assumed to be a stochastic process, X(t), representing the difference in electromagnetic potential across the cell membrane at the soma. The stochastic differential equation formulated for X(t) is that of a jump process, but physiological considerations suggest that a diffusion approximation is viable. Sufficient conditions for a diffusion model are derived. The Fokker-Planck diffusion equation is then modified to allow for: (1) a refractory period following absorption of the process at a boundary; and (2) excitatory (inhibitory) feedback from within the population. The resulting nonlinear hybrid system of equations provides a concise description of the activity of the neural populations under consideration. Dissert. Abstr.

N80-18808 Oklahoma State Univ., Stillwater.
THE DEVELOPMENT OF NORMAL FUNCTIONS Ph.D. Thesis
Joan E. Palsmeier Bell 1979 105 p
Avail: Univ. Microfilms Order No. 8003557

The development of normal functions from their origin to the present is discussed. Normal functions are defined in terms of normal families, which had their beginning in 1912. The term normal function first appeared in print in 1957 in an paper by Lehto and Virtanen in which they extended the Lindelof property from analytic and bounded to meromorphic functions. Many results on normal functions have since appeared in the mathematical journals. The analyzation of these theorems resulted in the grouping of the theorems into five major categories, which are presently abbreviated as those related to uniform rho-d continuity, generalizations of several of Lehto and Virtanen's results, cluster sets, the spherical derivative, and miscellaneous results. Among the areas for future study are normal harmonic functions and variations of normality. The study shows that since the paper by Lehto and Virtanen, normal functions have become an important area in the field of complex variables. Dissert. Abstr.

THE BOLTZMANN AND THE FOKKER-PLANCK EQUATIONS
J. A. Bittencourt Oct. 1979 60 p
(INPE-1606-RPE/082-Rev) Avail: NTIS HC A04/MF A01

A derivations are presented of the Boltzmann collision integral, which applies to the case of binary collisions in a dilute gas, and of the Fokker-Planck collision term, which applies to the case of multiple Coulomb interactions in a plasma. The assumptions involved in the derivation of the Boltzmann collision integral, and its irreversible character, are discussed. An anlaysis of Boltzmann's H theorem and a derivation of the equilibrium Maxwell-Boltzmann distribution function, based on a maximum entropy approach, are also presented. An aproximate expression for the Boltzmann collision term, valid for a weakly ionized plasma, is obtained through a spherical harmonic expansion of the distribution function. Next the Fokker-Planck equation is derived, starting from the Boltzmann collision integral. Finally, the Fokker-Planck coefficients are calculated for the Coulomb interaction and applied to the case of electron-ion collisions. Author

This report deals with a great variety of stochastic approximation procedures, for constrained and unconstrained systems and for convergence w.p.1. and weak convergence, all for systems with correlated inputs. The techniques are readily usable for many problems that are not explicitly treated there. This will be illustrated here for one particular class of constrained problems which is of great current interest and which arises in identification and in adaptive control theory. In fact, it is just such constrained problems to which more attention should be given, owing to their prevalence. The proofs are contained in various parts and, after the problem is defined, it is shown how to put the bits and pieces together. The problem and method are typical of a large class of adaptive systems which can be treated by similar methods, and is worth singling out. GRA

A familiar task is to solve f(x) = 0 given a continuously differentiable real function f. Newton's iteration could be tried; so could the Secant iteration. Except when the derivative f' costs appreciably less to evaluate than does f, the Secant iteration tends in practice to converge ultimately more efficiently than Newton's whenever both iterations converge to the desired root. When will they both converge? We find roughly that wherever Newton's iteration converges from every starting point in an interval I, so must the Secant iteration converge from every pair of starting points in I provided only that f actually reverses sign in I. This is an unexpected way for the Secant iteration to dominate Newton's. GRA

In their seminal paper, Fujisaki, Kallianpur and Kunita showed how the best least squares estimate of a signal contained in additive white noise can be represented as a stochastic integral with respect to innovation process, the integral being adapted to the observation process. The difficulty with this representation is that in general, this estimate is not useful for computing the estimate since the innovations process depends on the estimate of the signal itself. In this paper we discuss representation of the estimate directly in terms of the observation process. In doing so, we derive new results on multiple integral expansions for square-integrable functionals of the observation process and show the connection of this work to the theory of contraction operators on Fock space. This letter development is due to Nelson and Segal. We also present several applications of these results to determining sub-optimal filters. GRA

We present probabilistic algorithms for the problems of finding an irreducible polynomial of degree n over a finite field, finding roots of a polynomial, and factoring a polynomial into its irreducible factors over a finite field. All of these problems are of importance in algebraic coding theory, algebraic symbol manipulation, and number theory. These algorithms have a very transparent, easy to program structure. For finite fields of large characteristic p, so that exhaustive search through z sub p is not feasible, or algorithms are of lower order in the degrees of the polynomial and fields in question, than previously published algorithms. The results covered by this final report can be put in two categories - continuous-time systems and discrete-time systems. The continuous-time systems considered are bilinear in form. The bilinear systems have been extensively studied in recent years for three primary reasons. First, it has been shown that bilinear systems are feasible mathematical models for large classes of problems of practical importance. Second, bilinear systems provide higher order approximations to nonlinear systems than do linear systems. Third, bilinear systems have rich geometric and algebraic structures which promise a fruitful field of research. GRA

The identification of the extreme points of a convex set is an important problem in mathematics. One reason for identifying the extreme points is that they are, in many instances, the basic building blocks for the convex set. For instance, when the convex set is a compact subset of a locally convex space it is the closed convex hull of its extreme points (Krein-Milman Theorem) and if in addition the set is metrizable, any point in it has an integral representation in terms of the extreme points (Choquet's Theorem). Recently the extreme points for certain types of convex compact sets of probability distributions which occur in reliability theory have been identified. The extreme points for the set of discrete decreasing failure rate distributions are identified

without appealing to Choquet's Theorem, give an explicit representation for these distributions in terms of the extreme points. It turns out that techniques employed in this last paper can be used to identify the extreme points for certain convex sets of log-convex functions. The purpose of this paper is to present these results. GRA

ON THE ESTIMATION OF FUNCTIONS OF SEVERAL VARIABLES FROM AGGREGATED DATA Summary Report
Nira Dyn and Grace Wahba. Jul. 1979. 39 p. refs.
(AD-A077105; MRC-TSR-1974) Avail: NTIS
HC A03/MF A01 CSCL 12/1

This work was motivated by the problem of obtaining a smooth density function over a geographical region from data aggregated over irregular subregions. Minimization of a family of roughness criteria given 'volume' data lead to smooth multivariate functions Laplacian histosplines, having a certain order of the iterated Laplacian of constant value in each of the subregions and satisfying natural boundary conditions on the boundary of the region. For inexact data, e.g., in case of estimating an underlying density given counts of events by subregions, Laplacian smoothing histosplines are constructed, analogous to smoothing splines in the univariate case, and a method for choosing the smoothing parameter is presented. For both cases of exact and inexact data, modified roughness criteria, independent of the region, are discussed, and results known for point-evaluation data are extended to the case of aggregated data. (AD-A077102; MRC-TRC-1971) Avail: NTIS
HC A03/MF A01 CSCL 12/1

Newton's method is a well known and often applied technique for computing a zero of a nonlinear function. By using the theory of generalized equations, a Newton method has been developed to solve problems arising in both mathematical programming and mathematical economics. It is shown how Newton's method for generalized equations can be applied to the economic equilibrium problem of the Project Independence Evaluation System (PIES) Energy Model. Solutions to a simplified version of PIES are obtained using a Newton method, and comparisons are made to solutions which have appeared in the literature. GRA

HC A02/MF A01 CSCL 12/1

Newton's method for generalized equations (Josephy (3)) was applied to the economic equilibrium problem of the Project Independence Evaluation System (PIES) Energy Model. The resulting algorithm involves solving a sequence of linear complementary problems. Lemke's complementary pivot algorithm is used for this purpose. In this paper, it is shown that the linear complementarity problems will be copositive plus when the negative of the elasticity matrix, -e, of the consumer's quantity vs. price relation has the following properties: (1) positive diagonals, (2) negative off-diagonals, and (3) strict diagonal dominance. These conditions are satisfied for Hogan's example. Thus, Lemke's algorithm will either converge to a solution or show that no solution exists. Under the conditions of Theorem 1 of Josephy, a solution to the linear complementarity problems will always exist. Hence, Lemke's algorithm can be used when the conditions of the Theorem 1 of Josephy are satisfied. GRA

HC A03/MF A01 CSCL 12/1

This paper considers a class of variable metric methods for unconstrained minimization. The update formulas are such that the quasi-Newton equation is not necessarily satisfied. Under appropriate assumptions on the function to be minimized, each algorithm in this class converges globally and superlinearly. Many practical problems in operations research may be reduced to minimizing a function with or without constraints. By means of penalty functions and similar techniques a constrained minimization problem can be converted into a sequence of unconstrained minimization problems. GRA

HC A03/MF A01 CSCL 12/1

Newton's method is a well known and often applied technique for computing a zero of a nonlinear function. Situations arise in which it is undesirable to evaluate, at each iteration, the derivative appearing in the Newton iteration formula. In these cases, a technique of much modern interest is the quasi-Newton method, in which an approximation to the derivative is used in place of the derivative. By using the theory of generalized equations, quasi-Newton methods are developed to solve problems arising in both mathematical programming and mathematical economics. Two results concerning the convergence and convergence rate of quasi-Newton methods for generalized equations. Computational results of quasi-Newton methods applied to a nonlinear complementarity problem of Kojima. GRA

HC A05/MF A01 CSCL 12/1

A desirable feature of a database management system is the ability to support many views of the database via several user models. In order to provide this support while allowing the user to believe that his/her view and data model are the only ones, the database system must have a number of facilities. One of the most important of these is a mechanism to tell when view constraints will be satisfied given that the underlying database constraints are satisfied so that the user always sees what is expected. This paper deals with a particular instance of this problem where the constraints are functional dependencies and the views are created through relational algebra expressions. The problem immediately reduces to the problem of calculating all valid functional dependencies (and other constraints) on a relational algebra expression over relations in the base schema. The problem is undecidable in general but we give a sound and

complete algorithm when set difference is omitted from relational algebra. GRA

JACKKNIFE, RIDGE AND ORDINARY LEAST SQUARES ESTIMATORS OF REGRESSION PARAMETERS: A MONTE CARLO COMPARISON
Michael K. Lindell. Sep. 1979. 32 p. refs.
(Contract N00014-77-C-0127)
(AD-A077724; B-HARC-422-031) Avail: NTIS HC A03/MF A01 CSCL 12/1
This study reports the results of a Monte Carlo evaluation of the small sample performance of ordinary least squares OLS, ridge and jackknife estimators of regression coefficients. The primary criteria of evaluation are the mean square error MSE of the regression coefficients and the size of the t-statistics associated with these coefficients. The conditions studied are derived from a design in which two factors are varied the sample size to number of predictors N/P ratio and the metric quality of the data dichotomous and polychotomous. Results from 500 replications of each of six cells showed that OLS and jackknife estimators did not differ appreciably on either criterion. Ridge weights had substantially smaller MSE at the lowest levels of N/P 51. At high levels of N/P 201, ridge weights had a slightly greater MSE than either OLS and jackknifed weights. A dilemma in the use of t-statistics for ridge weights is presented. GRA

The goal of the research project was to proceed as far as possible in the study of a certain class of practical approximation problems. Namely, the problem is to reduce the complexity of multivariate functions by representing them precisely or approximately by combinations of univariate functions. A prototype problem is that of finding a best approximation to a function of two variables, F(x,Y), by a sum g(x) H(y). The prototype problem is thoroughly understood in the case that the functions involved are continuous and an approximation in the uniform sense is needed. GRA

AN IMPLICIT FUNCTION THEOREM FOR GROUP EQUATIONS GENERATED BY A FINITE AUTOMATION
Philip R. Thrift. Aug. 1979. 10 p. refs.
(Contract N00014-79-C-0322)
(AD-A078959; TR-150-Ser-2) Avail: NTIS HC A02/MF A01 CSCL 12/1
The study of mathematical semantics involves the study of mappings from a formal language L to a configuration space C. In this paper we consider the special case where L = L(D), D is a finite automaton, C is a group G, and the semantic map is defined by associating each production of D with a group element of G, p approaches theta (P). A sequence of productions would then be mapped to a product of corresponding group elements. When the semantic map is observed on sentences in L(D), we discuss a graph-theoretic method of solving for theta. GRA

REALIZATION THEORY FOR MULTIVARIATE GAUSSIAN PROCESSES, 2: STATE SPACE THEORY REVISITED AND DYNAMICAL REPRESENTATIONS OF FINITE DIMENSIONAL Interim Report
Anders Lindquist and Giorgio Picci. Jul. 1979. 30 p. refs.
Presented at the 2d Intern. Conf. on Inform. Sci. and Systems, Patras, Greece, 9-14 Jul. 1979.
(Grants AF-AFOSR-3519-76; NSF Eng-79-03731; AF Proj. 2304)
(AD-A078749; AFOSR-79-1275TR) Avail: NTIS HC A03/MF A01 CSCL 12/1
The purpose of this paper is twofold. First, some of the results of Part I are generalized and clarified, reformulated in a mathematical framework which we now perceive as more natural and conceptually sounder, the basic concept being perpendicularly intersecting subspaces. By relating minimality of stochastic realizations to the factorization of certain Hankel operators, the connections to deterministic realization theory is further clarified. Furthermore, spectral domain criteria for minimality, observability and constructibility are presented. Secondly, stochastic differential equation representations are presented for all state spaces which are finite dimensional. The infinite dimensional case will be the topic of Part III of this sequence of papers. GRA

Since the class of extended decreasing failure rate (EDFR) life distributions (i.e., distributions with support in (0, infinity)) is compact and convex, it follows from Choquet's Theorem that every EDFR life distribution can be represented as a mixture of extreme points of the EDFR class. We identify the extreme points of this class and of the standard class of decreasing failure rate (DFR) life distributions. Further, we show that even though the convex class of DFR life distributions is not compact, every DFR life distribution can be represented as a mixture of extreme points of the DFR class. GRA

PROBLEM IN STABILITY ANALYSIS OF FINITE DIFFERENCE SCHEMES FOR HYPERBOLIC SYSTEMS Interim Report, 6 Jan. 1978 - 31 May 1979
Moshe Goldberg. 1979. 6 p. refs.
(Grant AF-AFOSR-3046-76; AF Proj. 2304)
(AD-A078853; AFOSR-79-1285TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

The research consists mainly of generalizing previous work to obtain new, easily checkable stability criteria for general, dissipative or nondissipative, explicit or implicit difference approximations to hyperbolic mixed initial-boundary value problems. The criteria obtained are independent of the basic scheme and are given solely in terms of the boundary conditions; thus they are significantly more convenient than traditional criteria. The results imply that many well known boundary conditions, when used in combination with arbitrary dissipative or nondissipative schemes, always maintain stability. GRA

A GLOBALLY AND QUADRATICALLY CONVERGENT ALGORITHM FOR GENERAL NONLINEAR PROGRAMMING PROBLEMS Summary Report
Michael J. Best (Waterloo Univ., Ontario), Jurgen Brauninger (Stuttgart Univ., W. Germany), Klaus Ritter (Stuttgart Univ., W. Germany), and Stephen M. Robinson. Jul. 1979. 22 p. refs. Sponsored in part by NSF.
(Contract DAAG29-75-C-0024; Grant NSF MCS-74-20584)
(AD-A077104; MRC-TSR-1973) Avail: NTIS HC A02/MF A01 CSCL 12/1

This paper presents an algorithm for the minimization of a nonlinear objective function subject to nonlinear inequality and equality constraints. The proposed method has the two distinguishing properties that, under weak assumptions, it converges to a Kuhn-Tucker point for the problem and under somewhat stronger assumptions, the rate of convergence is quadratic. The method is similar to a recent method proposed by Rosen in that it begins by using a penalty function approach to generate a point in a neighborhood of the optimum and then switches to Robinson's method. The new method has two new features not shared by Rosen's method. First, a correct choice of penalty function parameters is constructed automatically, thus guaranteeing global convergence to a stationary point. Second, the linearly constrained subproblems solved by the Robinson method normally contain linear inequality constraints while for the method presented here, only linear equality constraints are required. That is, in a certain sense, the new method 'knows' which of the linear inequality constraints will be active in the subproblems. The subproblems may thus be solved in an especially efficient manner. Preliminary computational results are presented. GRA

REMARKS ON THE CALCULATION OF THE KERNEL APPROXIMATION IN UNSTEADY AERODYNAMICS [REMARQUES SUR LE CALCUL DU NOYAU EN AERODYNAMIQUE INSTATIONNAIRE]
R. Barreau. Paris: Assoc. Aeron. et Astronautique de France. 1979. 35 p. refs. In FRENCH. Presented at 15th Colloq. d'Aerodyn. Appl., Marseille, 7-9 Nov. 1978.
(Contract DRET-78-34-113-00)
(AAAF-NT-79-07; ISBN-2-7170-0534-X) Avail: NTIS HC A03/MF A01; CEDOCAR, Paris FF 29 (France and EEC) FF 33 (others)

Different analytic methods used in the calculation of unsteady aerodynamic forces are briefly reviewed. Emphasis is placed on calculating time and obtainable numerical precision of the inherent approximation. A kernel function method for deriving the approximations is then presented. In order to realisticaly compare the calculation of the integrals used in the different methods a computer program was used. Results show the kernel method to be twice as fast as any other method tried. Author (ESA)

NUMERICAL INTEGRATION OF A CLASS OF SINUSOIDAL FUNCTIONS WHOSE ARGUMENT IS THE INTEGRAL OF A MONOTONIC INCREASING FUNCTION
J. Rivero Laguna, R. Diazdelalglesia, A. Castillo Holgado, and J. M. Hernando Rabanos. Feb. 1979. 10 p. refs. In SPANISH; ENGLISH summary.
Avail: NTIS HC A02/MF A01

A procedure for the evaluation of the integral from zero to T of cos Theta(t) dt, with T constant, where Theta (t) = the integral from zero to t of 2 eta f(zero) + f(d)(u) du, is presented. Numerical methods are used when f(d)(u) is a nonotonic increasing function. Three kinds of functions were studied: linear, tangetial, and hyperbolic. Results can be generalized to other functions. It is also possible to generalize the method to nonotonic decreasing functions with some modifications. Based on the subintegral function chosen, a rule is established for determining the number of integration sub-intervals necessary to meet a relative error criterion. The use of different methods of numerical integration

is considered. Application of the method to the calculation of the Fourier transformation spectrum of a modulated FM-Chirp signal is suggested. Author (ESA)

A CENTER-COVARIANCE ADAPTIVE CLUSTERING ALGORITHM
F. Orti. Jun. 1978. 76 p. refs. Original contains color illustrations.
(IBM-SCR-02.78; ISBN-84-3600-046-3) Avail: NTIS HC A05/MF A01

A clustering algorithm, using a proximity measure as a weighted Euclidean distance in which the weight matrix is the inverse of the estimated covariance matrix for each cluster, is presented. Each sample is assigned to the cluster for which this weighted distance is minimum, provided that this minimum does not exceed a given threshold. Otherwise a new cluster with center in the sample is started, unless a given maximum number of clusters has been reached, in which case the sample is rejected and stored for later processing. The number of clusters is controlled by the periodic invocation of a merger routine (to merge clusters very near each other) and an elimination routine to get rid of clusters with very low densities. Several passes through the data are made until the percentage of rejected samples is low, or until a given number of passes is attained. After the clustering run is performed a post-run analysis is made to decide whether some clusters should be merged or not based on a statistical test. Result of some clustering runs on two generated data sets and a LANDSAT image are presented. Author (ESA)

ERROR RATES IN POISSON DISCRIMINATION Ph.D. Thesis
Mohammed Abdullah Shayib. 1979. 58 p.
Avail: Univ. Microfilms. Order No. 8003224

The optimal, actual, and plug-in error rates of allocation between two Poisson populations differing only in the value of the parameter are investigated. The optimal error rate can be found when the parameter is known, while for the other error rate calculations, the parameter has to be estimated. In the actual error rate the estimated value of the parameter is used in dividing the sample space only. In the plug-in estimate, the estimated value of the parameter, in addition to dividing the sample space, is used to estimate the probability density function. Results of a simulation study undertaken to estimate the error rates, check their variation, divide the sample space, and investigate sample size requirements are tabulated and plotted. Dissert. Abstr.

BAYES SEQUENTIAL ESTIMATION PROCEDURES FOR LIFE TESTING PROBLEMS Ph.D. Thesis
Evan Eva Chen. 1979. 76 p.
Avail: Univ. Microfilms. Order No. 8001130

Statistical problems which arise when nonnegative observations become available in an ordered manner (life testing problems) are studied. The life testing problem with M machines and exponential lifetime distribution is introduced. Optimal stopping times are found for both the continuous time and discrete time approach and the results are extended to the Weibull distribution failure model. The asymptotic sampling theory properties of the Bayes sequential procedure are given and asymptotic normality of the Bayes estimator is also proven. Finally the Bayes fixed sample size procedure is defined and compared to the Bayes sequential procedure by computing the ratio of the expected total costs associated with the two procedures. By assuming a sampling cost and a set up cost, numerical results on the optimal choice of the number of machines to be put on test are given. Dissert. Abstr.

N80-18848 Texas A&M Univ., College Station.
COMBINATORIC CLASSIFICATION OF MULTIVARIATE NORMAL OBSERVATION VECTORS Ph.D. Thesis
Charles Leslie Dunn. 1979. 103 p.
Avail: Univ. Microfilms. Order No. 8003123

The problem of classifying an observation vector as coming from one of two multivariate normal distributions which differ both in their mean vectors and covariance matrices is considered. A search for the procedure which minimizes the expected cost of misclassification is conducted within the class of procedures based upon a certain combination of n independent univariate discriminations. An efficient search of this class of procedures is made by employing an algorithm of the implicit enumeration type used in integer programming. In the case of known population parameters, the independent discriminant functions and exact probabilities of misclassification are found. When the parameters are unknown estimates are introduced for the coefficients of each univariate discriminant function and for the probabilities of misclassification. A jackknife procedure is introduced in order to improve the estimation process. The method is applied to the problem classifying a set of male twins as to whether they are monozygotic or dizygotic. Dissert. Abstr.

USING INCOMPLETE MULTIVARIATE DATA TO SIMULTANEOUSLY ESTIMATE THE MEANS Ph.D. Thesis
Susan Marie Hinkins. 1979. 109 p.
Avail: Univ. Microfilms. Order No. 8003718

A Bayes and an empirical Bayes estimator of the mean vector from a multivariate normal data set with missing observations are presented. Both estimators resemble the ridge-regression estimate, which shrinks the maximum likelihood estimate towards an a priori mean vector. Both estimators are consistent for and asymptotically equivalent to the maximum likelihood estimate. Small sample properties of the Bayes estimator are found, including conditions under which it has smaller risk than the maximum likelihood estimate. Numerical examples indicate that under some conditions the empirical Bayes estimator may also improve on the maximum likelihood estimator. Two computer programs which provide useful methods for estimation when there are data missing are also presented. The program RFACTOR creates Rubin's factorization table. The program MISSMLE calculates the maximum likelihood estimates of the mean vector and variance-covariance matrix from a multivariate normal data set with missing data. Dissert. Abstr.

THE EFFECTS OF SELECTED GRAPHIC DESIGN VARIABLES ON THE READABILITY OF MULTIPLE-LINE GRAPHS Ph.D. Thesis
George Wesley Bostick, Jr. 1979. 62 p.
Avail: Univ. Microfilms. Order No. 8003838

The separate and joint effects of three graphic design variables on the readability of multiple line graphs were examined. The three variables, each having two levels, were: (1) the method of representing scale markings, the levels being ruled grid and tick marks; (2) the method of representing data lines, the levels being line code and symbol code; and (3) the method of identifying data lines, the levels being labels and key. The three independent variables were combined in a (2)(2)(2) factorial design with repeated measures on all three variables. A multiple line graph was constructed depicting the fictional market values over time of four different agricultural exports to represent each of the eight experimental conditions. Each of the resulting eight graphs was identical except with respect to the combination of levels of the three independent variables. Dissert. Abstr.

ON THE WEAK CONVERGENCE OF A SEQUENCE OF GENERAL STOCHASTIC DIFFERENCE EQUATIONS TO A DIFFUSION
H. J. Kushner and Hai Huang. Oct. 1979. 41 p. refs.
(Contract N00014-76-C-0279; Grants AF-AFOSR-3063-77; NSF ENG-77-12946)
(AD-A078583; LCDS-TR-79-6) Avail: NTIS HC A03/MF A01 CSCL 12/1

A convenient and useful method for showing weak conver-

gence, to a diffusion, of the interpolated solutions of a (not necessarily Markovian) sequence of stochastic difference equations is developed. The technique involves the use of averaging methods to show that the weak limit satisfies the martingale problem of Strook and Varadhan which is associated with the diffusion. A truncation method is developed so that it is only necessary to work with the parts of the process before first escape from an arbitrary but bounded domain. The assumptions cover a wide variety of applications in systems theory, mathematical biology and elsewhere, but the method of proof is adaptable to other special cases where our particular assumptions might not hold. Two applications are given in order to illustrate the relative ease of use of the method. The driving noise process in the difference equations can depend on the solution process of the difference equation, and one application where this is useful is given (a rate of convergence problem for simple stochastic approximations with sequentially averaged observations). ON THE CUMULANTS OF CUMULATIVE PROCESSES
Walter L. Smith Oct. 1979 51 p refs
(Contract N00014-76-C-0550)
(AD-A078474; MIMEO-Ser-1257) Avail: NTIS HC A04/MF A01 CSCL 12/1

Cumulative processes were introduced in 1955 as a natural concomitant to the study of what the author called regenerative processes (Smith, 1955). In that first paper some basic results concerning cumulative processes were obtained; these were also explained, and the notions of cumulative and regenerative processes further detailed, in Smith (1958). For the purpose of the present discussion, the cumulative process is presented. GRA

ON A STOCHASTIC CONTROL PROBLEM WITH EXIT CONSTRAINTS Interim Report
Martin Day Jun. 1979 17 p refs
(Grant AF-AFOSR-3063-76; AF Proj. 2304)
(AD-A078372; AFOSR-79-1165TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

In this paper the logarithmic transformation of Fleming is used to discuss a specific problem of controlled diffusions. The problem is to minimize a certain quadratic functional of the applied drift while satisfying the requirement that the place where the process exists a domain is not in a specified subset of its boundary. The main result is that the solution of this problem is given by the logarithm of a related exit probability. GRA

OPTIONAL SAMPLING OF SUBMARTINGALES INDEXED BY PARTIALLY ORDERED SETS Interim Report
Robert Washburn, Jr. (Scientific Systems, Cambridge, Mass.) and Alan S. Willsky Oct. 1979 46 p refs
(Grant AF-AFOSR-3281-77)
(AD-A077409; LIDS-P-953; AFOSR-79-1153TR) Avail: NTIS HC A03/MF A01 CSCL 12/1

The optional sampling theorem for martingales indexed by a partially ordered set is true if the index set is directed. However, the corresponding result for submartingales indexed by a partially ordered set is generally false. In this paper we completely characterize the class of stopping times for which the optional sampling theorem is true for all uniformly bounded submartingales indexed by countable partially ordered sets. By assuming a conditional independence property, we show that when the index set is R to the 2nd power the optional sampling theorem is true for all uniformly bounded submartingales and all stopping times. This conditional independence property is satisfied in cases where the submartingales and stopping times are measurable with respect to the two-parameter Wiener process. A counter example shows that the optional sampling result is false for R to the n power when n greater than 2 even if the conditional independence property is satisfied. GRA

THE ROLE OF EXCHANGEABILITY IN INFERENCE Research Report, 1 Jun. 1977 - 1 Aug. 1979
D. V. Lindley and Melvin R. Novick Aug. 1979 49 p refs
(Contract N00014-77-C-0428; RR0420401)
(AD-A077378; TR-79-8) Avail: NTIS HC A03/MF A01 CSCL 12/1

This paper is concerned with basic problems of statistical inference. The thesis is in three parts: (1) that inference is a procedure whereby one passes from a population (or sample) to a new individual; (2) that this connection can be established using de Finetti's idea of exchangeability or Fisher's concept of a subpopulation; and (3) in making the connection use must be made of the appropriate probability. These three principles are used in a variety of situations and the topics discussed include analysis of variance and covariance, contingency tables, and calibration. Some comments on randomization are also included. GRA

RANK WEIGHTING IN MULTIATTRIBUTE UTILITY DECISION MAKING: AVOIDING THE PITFALLS OF EQUAL WEIGHTS Technical Report, Dec. 1978 - Dec. 1979
William G. Stillwell and Ward Edwards Sep. 1979 52 p refs
(Contract N00014-79-C-0038)
(AD-A078941; USC-001595-2T; SSRI-RR-79-2) Avail: NTIS HC A04/MF A01 CSCL 12/1

The notion of 'dominance' in multiattribute utility decision contexts leads to a change in the considered alternative set. The implications of this set change are discussed in relation to the conditions of Wainer's (Wainer, 1976) 'equal weights theorem' and the resulting sensitivity to weighting of importance dimensions demonstrated. Data from three multiattribute decision making studies are examined using four rank weighting techniques as well as equal weights. Rank weighting of importance dimensions demonstrate marked improvement of approximation as reflected in both Pearson and rank order correlations for measures of overall utility across alternatives within the nondominated subset. Implications for multiattribute utility application are discussed. GRA

THE ASYMPTOTIC DISTRIBUTION OF MORTALITY RATES IN COMPETING RISKS ANALYSES
Joseph C. Gardiner Dec. 1979 16 p refs
(Contract N00014-79-C-0522; Grant BSRG-S07-RR07049-14)
(AD-A078948; RM-405) Avail: NTIS HC A02/MF A01 CSCL 12/1

For a sample of individuals from an animal or human

population under observation in a clinical trial or life test, mortality rates are defined for each risk to which the population is exposed. By considering only the crude risk functions and cause-specific failure rates in a basic competing risks model, these mortality rates are shown to have an asymptotic normal distribution. An expression for the asymptotic correlation between a pair of mortality rates is thus obtained and a necessary and sufficient condition for their asymptotic independence is investigated in some general situations with reference to only the cause-specific failure rates and the survival function of the individuals. GRA

CONVERGENCE OF THE CONDITIONAL DISTRIBUTION OF THE MAXIMUM LIKELIHOOD ESTIMATE, GIVEN LATENT TRAIT, TO THE ASYMPTOTIC NORMALITY: OBSERVATIONS MADE THROUGH THE CONSTANT INFORMATION MODEL

Fumiko Samejima Oct. 1979 116 p refs
(Contract N00014-77-C-360; RR0420401; NR Proj. 150-402)
(AD-A077706; RR-79-3) Avail: NTIS HC A06/MF A01 CSCL 12/1

The Constant Information Model can be used when we substitute a subset of equivalent, binary items, whose item characteristic functions are unknown, for the Old Test, or a subset of test items whose operating characterictics are known, in estimating the operating characteristics of item response. In so doing, it has been suggested that we choose items whose common discrimination power is low, so that the interval of latent trait, for which their common item characteristic functions in the Constant Information Model assumes positive values, is wide enough to cover the ability levels of all the examinees on which the operating characteristics of new items are to be estimated. This suggestion needs more investigation and precision, however, since it is expected from theory that the convergence of the conditional distribution of the maximum likelihood estimate, given latent trait, to the normality is slow for the values of latent which are close to the two endpoints of the above interval, in comparison with those close to the midpoint. In this paper, through a simulation study, the speed of convergence of the conditional distribution of the maximum likelihood estimate to the normality at various levels of latent trait is observed, using 20 hypothetical test sessions, in each of which 10 equivalent, binary test items are given. As was expected, the conditional distribution of the maximum likelihood estimate is skewed for the values of latent trait close to the two endpoints of the interval and the convergence is slower. GRA

A BAYESIAN NONPARAMETRIC ESTIMATOR OF SURVIVAL PROBABILITY ASSUMING INCREASING FAILURE RATE Interim Report

W. J. Padgett and L. J. Wei Aug. 1979 21 p refs
(Contract F49620-79-C-0140; AF Proj. 2304)
(AD-A077458; TR-42; AFOSR-79-1033TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

Bayesian nonparametric estimators of the survival function, the failure rate function, and the density function are obtained using jump processes as prior distributions on the space of increasing failure rate functions. The jump processes are more appealing intuitively than previously used Dirichlet processes, integral gamma process, and processes neutral to the right and have a meaningful physical interpretation. Examples are given and the estimates are compared with the maximum likelihood estimates. In addition, the Bayesian nonparametric estimators are presented for arbitrarily right-censored observations. CONVERGENCE OF WEIGHTED SUMS OF RANDOM ELEMENTS IN TYPE p SPACES Interim Report

Robert Lee Taylor Jul. 1979 23 p refs
(Contract F49620-79-C-0140; AF Proj. 2304)
(AD-A077438; TR-43; AFOSR-79-1034TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

The study of probability density estimation led to estimates in the form of averages or weighted sums of random variables whose values are in function spaces (Parzen (1962) and Rosenblatt (1971)). As a application of the law of the iterated logarithm in linear measurable spaces, Kuelbs (1978) considered the rates of convergence in these density estimates. The estimates are not always averages of sequences of random elements in a Banach space but are more often weighted sums of arrays of random elements where the weights are not necessarily Toeplitz matrices. In this paper the convergence of weighted sums of arrays of random elements in Banach spaces of type p is obtained both in probability and almost surely. As corollaries these results have forms of Pruitt's (1963) and Rohatgi's (1971) results for Banach spaces and also have extensions for the results of Padgett and Taylor (1976). However, exact statements of the theorems are related to the possible applications for density estimation. GRA

ON A CONJECTURE CONCERNING LEAST FAVORABLE CONFIGURATIONS IN CERTAIN TWO-STAGE SELECTION PROCEDURES

Klaus-J. Miescke and Joachim Sehr (Maine Univ.) Oct. 1979 16 p refs
(Contract N00014-75-C-0455)
(AD-A077591; MMS-79-29) Avail: NTIS HC A02/MF A01 CSCL 12/1

Given k normal populations with unknown means and a common known (or unknown) variance a two-stage procedure P sub 1 with screening in the first stage to find the population with the largest mean is under concern. It was proposed and studied previously by Cohen (1959), Alam (1970), Tamhane and Bechhofer (1977, 1979) and Gupta and Miescke (1979). But up to now a conjecture concerning least favorable parameter configurations in an indifference zone approach remained unproved for k = or > 3. In this paper we give a non-standard proof of the conjecture in case of k = 3 for P sub 1 which (under minor changes) works also for a simplified version P sub 2. Besides, the point is exposed where another (more intuitive) method of proof fails to work. GRA

ASYMPTOTIC MEASURES OF SYSTEM PERFORMANCE UNDER ALTERNATIVE OPERATING RULES, 2
Richard E. Barlow and Esther Sid Hudes Jun. 1979 29 p refs
(Grant AF-AFOSR-3179-77; AF Proj. 2304)
(AD-A078827; ORC-79-7) Avail: NTIS HC A03/MF A01 CSCL 12/2

This is the second part of a study of stochastic processes generated by failures and repairs of components in a series system. In particular, we consider a two component series system where failure of component 1 shuts off component 2 but not vice versa. In Part I, selected measures of system performance were calculated for general failure and repair distributions as implicit functions of system availability. In order to obtain explicit results, we assume in this part that either component 1 or component 2 has exponential failure and repair distributions. For the case where component 1 has a general failure distribution, we obtain counter-intuitive results concerning the long run average of system uptimes. Intuitively, it is best to shut off an operating component when the system is down. However, this is not correct if the component failure distribution is IFR (or more generally NBUE) and we wish to maximize the long run average of system uptimes. We use the method of supplementary variables to obtain explicit results for important special cases. GRA

A unified formulation of the multi-commodity transportation and transshipment spatial equilibrium models has been devised as a linear complementarity problem with certain block structure. It is shown that a block successive overrelaxation method is applicable for solving the resulting complementarity problem. The method consists of solving a sequence of subproblems of the single-commodity type. These subproblems are to be solved by a special-purpose principal pivoting algorithm developed in an earlier paper. Computational experience of solving some fairly large problems by the proposed hybrid method is presented. GRA

MULTIPLIER REPRESENTATIONS OF THE TWO-DIMENSIONAL LATTICE GROUP Ph.D. Thesis
Wesley Edward Mitchell 1979 85 p
Avail: Univ. Microfilms Order No. 8003002

There exist multipliers on the two-dimensional lattice group such that the multiplier dual is not smooth. Thus, classical methods will not suffice for the description of the multiplier dual. A set of generalized tensor product representations is constructed, beginning with irreducible multiplier representations induced from some normal subgroup. A complete decomposition theory is given for this set. Because of a relationship between certain of these generalized tensor products and multiplier regular representations, direct integral decompositions of multiplier regular representations are found. Furthermore, there are infinitely many mutually disjoint decompositions. The integrands have the property that, for a certain fixed subgroup N and any positive integer n, there is a decomposition satisfying: the restriction of each integrand to N is equivalent to a direct sum of n copies of the regular representation of the integers. Dissert. Abstr.

CLASSIFICATION OF THE NORMAL SUBGROUPS OF GI SUB N (R) Ph.D. Thesis
Jeanna Beth Moore 1979 50 p

Avail: Univ. Microfilms Order No. 8004393

It is shown that for any ring R (not necessarily commutative) the solvability of certain systems of equations is sufficient to show that normal subgroups of GL sub n (R) are also sandwiched between two normal subgroups of the group of elementary transvections. The system of equations whose solvability is necessary are those whose coefficient matrix is obtained from an invertible matrix by deleting the ith row and jth column i and j and whose constant terms are all zero except for the first which is the element of the jth row and ith column of the inverse of the matrix. Various rings in which these systems are solvable are discussed. For example, these systems are shown to be solvable in division rings by use of Ore determinants. Other rings discussed are the ring of cross sections of a sheaf over a Boolean space and both products and direct limits of rings in which the systems are solvable. Dissert. Abstr.

GENERALIZED INVERSES OF MATRICES OVER LOCAL RINGS Ph.D. Thesis
Jerry Dale Hopponen 1979 85 p
Avail: Univ. Microfilms Order No. 8002984

A theory of generalized inverses of rectangular matrices over an arbitrary local ring is presented, and related combinatorial results derived. The concept of a generalized inverse is used to discuss solutions of the matrix equation Ax = b. For fixed matrices A and B having the same rank over an arbitrary field, linear algebraic results are derived for relations between the null and range spaces of A and B. As a special case, some results are stated when the ground field is formally real, and additional relations are determined when B = A(T). A canonical form is developed for matrices over a local ring in which the maximal ideal is principal and the descending chain condition holds. Over such rings, it is shown that the conditions which are usually taken to define the various types of generalized inverses for a matrix A cannot begin to be satisfied unless A has a special canonical form. Dissert. Abstr.

STABILITY AND FIXED POINTS OF POINT DISSIPATIVE SYSTEMS Interim Report
Paul Massatt Jun. 1979 30 p refs
(Grant AF-AFOSR-3092-76; AF Proj. 2304)
(AD-A077410; AFOSR-79-1167TR) Avail: NTIS HC A03/MF A01 CSCL 12/1

The result requires the stronger assumption of compact dissipative. The principle result of this paper will be to get similar results under the weaker assumption of point dissipative. Need exists to add additional hypotheses on the space and the operator T. These hypotheses are naturally satisfied for stable neutral functional differential equations and retarded functional differential equations of infinite delay. The paper will be divided into four sections. The first will contain various definitions. The second will contain an abstract theorem relating point dissipative in one space to bounded dissipative in another, and to the existence of a fixed point. The third section will apply the result to stable neutral functional differential equations. The final section gives applications to retarded functional differential equations with infinite delay. MAGNETIC PROPERTIES OF AMORPHOUS HEISENBERG FERROMAGNET WITH RANDOM ANISOTROPY
R. Kishore, I. C. da Cunha Lima, and M. Cristina Forti Dec. 1979 15 p refs Revised Submitted for publication
(INPR-1641-RPE/097-Rev) Avail: NTIS HC A02/MF A01

Magnetization, susceptibility, and the critical temperature for a spin one amorphous Heisenberg ferromagnet with random local anisotropy are calculated in molecular field approximation for the exchange interaction. The effects of random fluctuations of the magnitude of the local anisotropy about its crystalline value are studied for various probaility distributions. It is found that for a given randomness, measured in terms of the root mean square fluctuation of the magnitude of the local anisotropy, the magnetization and the critical temperature depend more on the range, defined as the magnitude of the maximum value of the fluctuation from its mean value, than the shape of the probability distribution function. The effect of randomness decreases as the crystalline value of the anisotropy increases. Calculation of the susceptibility shows that above the critical temperature, randomness has no effect. Author

ANALYSIS OF ACOUSTIC VARIATIONS IN THE OCEAN PRODUCED BY COMBINED ENVIRONMENTAL EFFECTS Ph.D. Thesis
Kenneth George Hamilton 1979 165 p
Avail: Univ. Microfilms Order No. 8004759

Mathematical models of sound propagation in the ocean are formulated using ray theory. Variations in the ocean environment, such as currents, horizontal and vertical sound-speed changes, and bottom topography, are examined separately and in combination to ascertain their effects on acoustic amplitude and phase. Simplified approximations are derived in order to predict these effects. The effects of a combination of sound-speed and current fluctuations on propagation of a continuous wave (CW) signal in a deep ocean model are analyzed. The influence of sound-speed fluctuations on propagation of a CW signal in an ocean with a uniformly sloping bottom and a horizontal surface is analyzed using ray theory. A simplified approach is described for determination of phase perturbations produced by variations in sound speed and current in the ocean. The method is demonstrated for both shallow and deep ocean examples, when the phase perturbation arises from weak horizontal deviations from a horizontally uniform sound-speed structure. It is also illustrated for currents in the deep ocean, considering cases with and without horizontal variations in current speed. Dissert. Abstr.

MULTI-OBSTACLE ACOUSTIC SCATTERING Ph.D. Thesis
Lawrence Lamar Sorensen 1979 88 p
Avail: Univ. Microfilms Order No. 8004386

The simple source formulation was extended to the case of scattering of acoustic waves in two dimensions by several obstacles. The method consists of representing the velocity potential as the integral of an unknown source density times an appropriate Green's function, the integral to be taken over the contours enclosing the two dimensional scatterers. A computer program was used to implement this method and calculate the source density and farfield scattering amplitude. Cases which previously defied verification were checked using the reciprocity principle or the optical throrem. The former states that the interchange of source and observation points, both infinitely far removed from the scatterer, leaves the source density unaltered. The optical theorem, which relates the total scattering cross section to the real part of the forward scattering amplitude,

provides a non-linear check on the scattering amplitude. Sample problems considered include two circular cylinders, two elliptical cylinders and a circular cylinder above an infinite flat plat. Plots of farfield scattering amplitude and verification data are included. Dissert. Abstr.

INFLUENCE OF ABSORPTION ON ULTRASONIC NON-SPECULAR REFLECTIVITY Ph.D. Thesis
Tran Dai Kiem Ngoc 1979 82 p
Avail: Univ. Microfilms Order No. 8004699

A theoretical and experimental investigation of nonspecular ultrasonic reflectivity at a liquid-solid interface is described. The role of attenuation in the formulation of the plane wave reflection coefficient is analyzed. This attenuation-dependent reflection coefficient is used in a numerical integration method which is developed for the calculation of the reflected beam profile. The reflected profile is calculated for two specific cases: incidence near the Rayleigh angle for a water-stainless steel interface and incidence near the longitudinal critical angle for a water-Plexiglas interface. In each case, the nonspecular reflection effects are investigated as one parameter is varied and the others are kept unchanged. Comparisons are made with results obtained by the Bertoni and Tamir formulation for incidence at the Rayleigh angle. The theoretical predictions are then compared to experimental results obtained by the Schlieren visualization technique. Dissert. Abstr.

APPLICATION OF COHERENCE IN FAN NOISE STUDIES
Joseph R. Balombin Feb. 1980 26 p refs
(NASA-TP-1630; E-157) Avail: NTIS HC A03/MF A01 CSCL 20A

A study of fan noise was made by using the coherence function to obtain far field spectra that were coherent with the fan rotational rate. Choosing fan rotational rate as one of the two variables yielded new information about the far field noise generated during static fan testing. As a result of this coherent data processing, the inlet fan-tone noise present in static testing was determined to be mostly random when the rotor-alone and rotor-stator interaction tones were cut off. After the rotor-alone sound field was cut on, the sound pressure became coherent, and the angular extent of high coherence increased as fan speed was increased. In addition, the sound field was organized as a pattern of lobes whose amplitude varied slowly with time. Additional fan test results indicate that operating the fan with an inflow control device can partially reduce the fan-tone noise levels to those produced by coherent processing. R.E.S.

THE RESPONSE OF AN ELECTROSTATIC MICROPHONE TO AN AIRFLOW
R. Gamba Jun. 1979 30 p refs Transl. into English from Rev. d'Acoustique (France), v. 40, 1977 p 46-57
(RAE-Lib-Trans-2011; BR71912) Avail: NTIS HC A03/MF A01

The origins of the different pressure fluctuations picked up by a microphone in an air stream are discussed. The behavior of a condenser microphone when the direction of the airflow is perpendicular to the diaphragm is theoretically studied. Finally an experimental study is conducted during which the following parameters are varied: the average wind velocity (5-20 m/s); the percentage of turbulence (0.01-1%); and the diameter of microphone (1 inch, 1/2 inch, 1/4 inch). The output levels induced by turbulence and by a laminar quiet airflow are examined. The effect of the standard protection grill or ogive is studied in each case. M.G.

ATMOSPHERIC EFFECTS ON THE SPEED OF SOUND
E. A. Dean Aug. 1979 60 p refs Prepared in cooperation with Texas Univ. at El Paso
(Contract DAAG29-76-D-0100; DA Proj. 1L1-62111-AH-71) (AD-A076060; ERADCOM/ASL-CR-79-0100-4) Avail: NTIS HC A04/MF A01 CSCL 20/1

The small-signal speed of sound in humid air is calculated from a model which includes the real-gas effects from the equation of state for humid air and the vibrational dispersion due to N2, O2, and CO2 relaxation. Other atmospheric effects such as dispersion due to viscothermal and rotational relaxation, heat radiation, propagation along the air-ground boundary, the density gradient, turbulence, aerosols and fogs are considered and found to be unimportant for frequencies between 1 Hz and 5 MHz (at one atmosphere). The uncertainty in predicting the sound speed varies between 0.22 m/sec at -90 C to 0.05 m/sec at 90 C. Experimental results in humid air at 20 C and 30 C are in excellent agreement with the model. For the propagation frequency of 20 Hz, it is found that the presently used sound-ranging formula, c = 20.06 x square root of T sub s, where T sub s = .75t sub v - .25t - 273.2 (t sub v = virtual temperature), differs by up to 0.5 m/sec over the range -60 C to 60 C. A correction to the 'sonic' temperature determination is suggested which results in deviations of less than 0.05 m/sec over the temperature range from -60 C to 50 C and for relative humidities from 5% to 100%. THE GENERATION OF A TOLLMIEN-SCHLICHTING WAVE BY A SOUND WAVE
John W. Murdock Aug. 1979 22 p refs
(Contract N00014-78-C-0491)
(AD-A075816; ATR-79(7775)-1) Avail: NTIS HC A02/MF A01 CSCL 20/1

A spectral numerical method is used to study the two-dimensional unsteady flow over a flat plate in the presence of a plane sound wave propagating parallel to the flow. For s = omega x/u at infinity = O(1), no observable interaction or energy interchange between the sound wave and the Tollmien-Schlichting wave is present. In the region (s - or < = 0) edge, an interaction occurs; the magnitude of this interaction is computed. A plane sound wave with dimensionless frequency omega nu/U-square at infinity = .000056 generates a Tollmien-Schlichting wave of the same frequency and an amplitude at the first neutral point .0001 times the sound-wave amplitude. Computations at a second, lower frequency result in a lower neutral point amplitude. The response of the boundary layer to large unsteady disturbances is discussed and compared with published behavior based on the boundary layer equations. Solutions of the Orr-Sommerfeld equation are examined and found to have a different character for s = or > O(1) consistent with the more complete equations. GRA

TRANSIENT ACOUSTIC RADIATION FROM ELASTIC PLATES Ph.D. Thesis
Seroj Mackertich Sengerdy Apr. 1979 112 p refs
(Contract N00024-79-C-6043)
(AD-A076772; ARL/PSU-TM-79-50) Avail: NTIS HC A06/MF A01 CSCL 20/1

An expression for the acoustic radiated pressure emanating from an infinite elastic plate excited by a unit impulse load for different observation angles and distances is obtained analytically. The solution is obtained by use of Fourier transform on time and Hankel transform on the radial coordinate. Using Cauchy contour integration theorem and regular and modified saddle-point methods, the inverse Fourier and Hankel transforms were

evaluated. The unit impulse response and convolution theorem was then utilized to obtain an expression for radiated pressure of an infinite elastic plate excited by constant magnitude load, square pulse and CW-pulse loads. The first arrival of acoustic wave at an observer point in the acoustic medium due to an impulse load was shown to correspond to the time of travel for the normal distance from the observer to the plate. After the first arrival, the acoustic pressure was shown to decay sinusoidally with an increasing period of oscillation. The decay rate for long times was shown to be the reciprocal of elapsed time. Similar response was shown for a square pulse and for a CW-pulse after the removal of the load. Author (GRA)

ACOUSTICAL BEHAVIOR OF THICK, COMPOSITE, FLUID-LOADED PLATES, CALCULATED USING TIMOSHENKO-MINDLIN PLATE THEORY Interim Report
Anthony J. Rudgers 16 Nov. 1979 27 p refs
(RR0110842)
(AD-A077671; NRL-8317) Avail: NTIS HC A03/MF A01 CSCL 20/1

The reflected and radiated acoustic fields of a thick, composite plate of infinite extent, consisting of a substrate layer bonded at an interface to a coating layer, which has fluid on one side and which is unconstrained on the other side, are calculated theoretically. The reflected and radiated acoustic fields are related by means of a structural response function that completely characterizes the elastic behavior of the composite plate and of the fluid. The composite-plate acoustical problem is analyzed by extending the Timoshenko-Mindlin theory of thick homogeneous plates. The Timoshenko-Mindlin thick-plate equations are used to describe the flexural waves generated in each of the two layers of the composite plate, owing either to a plane acoustic wave in the fluid impinging on the plate or to a point-force excitation of the plate. Two ideal types of bonding between the coating and the substrate are considered: the 'welded' bond, for which contiguous plate elements on either side of the interface move in complete unison, and the 'perfectly slipping' bond, for which such plate elements move in unison normal to the interface but independently parallel to the interface. The analytic form of the structural response function of a composite plate shows that in general a thick bilaminar composite plate of the type considered cannot be modeled by a simple homogeneous thick plate with artificial or 'average' material constants. The analysis also shows that the bond between the substrate and the coating significantly affects the acoustic reflection and radiation characteristics of the composite plate. GRA

SURFACE SCATTERING STUDIES Final Report, Apr. 1978 - Jun. 1979
J. G. Zorning, P. M. Schultheiss, J. Snyder, S. Singhal, and D. C. Gilbert Aug. 1979 99 p refs
(Contract N00014-75-C-1014)
(AD-A078434; S/IS-7905) Avail: NTIS HC A05/MF A01 CSCL 20/1

Progress in a number of ongoing projects is reported. These include studies of bistatic and monostatic surface scattering strength, surface reverberation modelling, measurement of slope and correlation statistics of surfaces, and measurement of Doppler shifts and spread. The extension of previous scattering strength measurements to lower frequencies has shown the strengths observed to be 10 to 15 dB higher under similar wind conditions but with wavelengths approximately 8 times longer. These studies have led to the beginning of development of a model for reverberation based on a characterization of the surface as an ensemble of facets. A method for precision measurement of model tank waveheight and wave slope time series has been developed. The system is based on fine wire capacitance probes. It has been used to compile a set of slope measurements which is consistent with data reported by other investigators. A system for automatic measurement of time-space waveheight correlation has been developed. GRA

COLLECTIVE ION ACCELERATION CONTROLLED BY A GAS GRADIENT Ph.D. Thesis
Frederick Michael Mako, Jr. 1979 208 p
Avail: Univ. Microfilms Order No. 8002314

Several schemes were studied for attaining collective ion acceleration by the injection of an intense relativistic electron beam along magnetic field lines into a low pressure (less than 1 Torr of helium) neutral gas. Positive, zero, and negative gas pressure gradient schemes were examined. The case where the gas pressure decreases from the beam injection plane (the negative gradient scheme) is discussed. A simple collective ion acceleration model is presented. The model is modified to account for the electron energy distribution under the conditions where the ion energy is a maximum. A particle code was developed to enable a study of the complete, self consistent, initial condition problem. Dissert. Abstr.

COLLISIONAL REDISTRIBUTION OF LIGHT SCATTERED BY ATOMIC VAPORS Ph.D. Thesis
Michael Gordon Raymer 1979 183 p
Avail: Univ. Microfilms Order No. 8003008

The effects of atomic collisions on the scattering of laser light by atomic vapors was examined. At high laser intensities, the light scattering was found to become stimulated, and was spectrally resolved into two components: stimulated Raman scattering (SRS) and stimulated collision induced fluroescence (SCF). A theory was developed to describe the behavior of SRS and SCF when the incident laser was of the pulsed type. The experimental results, including pressure dependence, focusing dependence, and directional dependence of the SRS and SCF, were found to be in agreement with the theory presented. Dissert. Abstr.

ROTATIONAL-VIBRATIONAL EXCITATION IN COLLISIONS OF ATOMIC IONS WITH DIATOMIC MOLECULES Ph.D. Thesis
James Donald Clark, Jr. 1979 238 p
Avail: Univ. Microfilms Order No. 8003743

Rotational vibrational excitation in atomic ion-diatomic molecule collisions are considered at intermediate ion projectile energies in the range of 1 - 3 keV. Collisions between He(+) and H2 are taken as an example. Three separate approaches are used in the description of the collision system. Inelastic energy transfer in collision systems and projectile scattering angle are calculated from a totally classical approach. Cross sections for scattering as a function of momentum transfer vector are calculated from a completely quantum mechanical approach. Molecular transitions from the ground rotational vibrational state to several excited rotational vibrational molecular states are considered. Dissert. Abstr.

DRIFT TUBE STUDIES OF ION-MOLECULE REACTIONS AT

HIGH AND LOW TEMPERATURES Ph.D. Thesis
Aikwo Chen 1979 135 p
Avail: Univ. Microfilms Order No. 8004855

A temperature variable drift tube mass spectrometer apparatus has been used to determine the rate coefficients for the charge- and atom-transfer reactions O(+)N2 and O(+)+O2 (from 300K to 900K), He(+)+H2 and He+D2 (from 78 to 300K), as well as the association reactions R + 2R, where R is He, Ne or Ar (from 78K TO 300K). For the atom transfer reaction O(+)+N2, the rate coefficient decreases from (1.2 + or - 0.1) x 10 to the minus 12th power cu cm/sec to 0.5/10 to the minus 12th power cu cm/sec as the temperature is increased from 300K to 900K. For the charge transfer reaction O(+)+O2, the rate coefficient decreases from (2.1 + or - 0.2)x 10 to the minus 11th power cu cm/sec at 300K to half this value as the temperature is raised to 700K. These results are in good agreement with heated flowing afterglow results.

COVARIANT ELECTRODYNAMICS IN A MEDIUM Ph.D. Thesis
Nak Hyung Hong 1979 59 p
Avail: Univ. Microfilms Order No. 8004389

The energy-momentum and angular momentum emission rates for an arbitrarily moving charge (whose speed is less than that of light in the medium) in a uniform transparent medium are calculated in manifestly covariant form. The calculations are executed for three types of stress tensors: Minkowski, Abraham, and Marx. It is found that the energy-momentum emission rates for all three tensors are found to be equal. Only for the Marx tensor is this rate independent of the orientation of the associated asymptotic space-like surface. The calculations are extended to a dyon of electric charge m. It is shown that all three tensors take the same form as those of the electric charge case except that e squared is replaced by e squared t (epsilon/mu)(m squared). It may be concluded, as far as radiation is concerned, that a magnetic monopole behaves like a charged particle of effective charge (square root of (epsilon/mu))(m).
Dissert. Abstr.

N80-18896 California Univ., Davis.
STUDIES IN MOLECULAR DYNAMICS OF THE FRICTION COEFFICIENT AND THE LORENTZ GAS Ph.D. Thesis
William Edward Alley 1979 184 p
Avail: Univ. Microfilms Order No. 8003494

Various hard sphere molecular dynamics studies are presented. The first describes a modification of Fick's diffusion law, required whenever long time correlations are present. For the Lorentz gas, the non-Markovan nature of the transport process is shown to correspond to a random walk where, after each step, the particle waits for a time as sampled from a waiting time distribution before making the next move. Second, the mass and size dependence of the friction coefficient as well as its dependence on boundary conditions is discussed. A molecular dynamics method is presented which calculates the infinite-mass friction coefficient of finite size hard-sphere particles. The applicability of hydrodynamics is considered to describe fluctuations in fluids on the molecular level. It is shown that the fluctuations present in a system of hard spheres, when placed between closely spaced parallel hard walls, lead to an acoustical resonance for those wavelengths which correspond to the spacing, or integer fractions thereof.

AN INTENSE SOURCE OF NEGATIVE POLARIZED HYDROGEN IONS Ph.D. Thesis
Richard Stephen Raymond 1979 136 p
Avail: Univ. Microfilms Order No. 7928660

Experiments are described which were conducted to study the feasibility of producing an intense beam of negative polarized hydrogen ions by ionizing thermal polarized hydrogen atoms by collision with a fast beam. Results indicate that if negative hydrogen ions are used as the fast beam, the space charge electric fields associated with the ionizing beam seriously complicate formation of the negative polarized beam. Experiments have demonstrated that a beam of 45 keV neutral cesium atoms may be used to produce intense negative polarized hydrogen or deuterium beams. Negative beams with currents as high as 3.1 micro amps are produced by this method. The tensor polarization of a deuterium beam was measured to be 92% of expected value, with weak field ionization. The emittances of hydrogen and deuterium beams were measured and found to be sufficiently small for good transmission through accelerators. Prospects for an operating ion source using this method are discussed.
Dissert. Abstr.

COMPUTER SIMULATION AND THEORETICAL STUDIES OF MOLECULAR LIQUIDS Ph.D. Thesis
Sohail Murad 1979 294 p
Avail: Univ. Microfilms Order No. 8003966

Theoretical and simulation methods are developed and applied to both real and model fluids. A method for carrying out computer simulation studies of molecular liquids, based on quaternions was used to carry out detailed molecular dynamics studies of methane, vanadium tetrachloride, and hydrogen chloride. The simulation results for the fluids are compared with the available experiments data for thermodynamic properties, structure factor, mean squared torque, and diffusion coefficients. Quantum corrections to the thermodynamic properties are worked out. In an effort to simplify the use of site-site models in current theories, the expansion of such potentials in spherical harmonics was studied. Explicit analytical expressions are obtained for molecules of general shape, and the convergence of the series is studied for linear, tetrahedral, and octahedral molecules of various bond lengths. A second order perturbation theory is presented for the pair correlation function of a molecular fluid. The theory is compared with three integral equation methods and with simulation results, for both dipolar and quadrupolar fluids. Such comparisons are given for the harmonic coefficients of the pair correlation function, the thermodynamic properties, the mean squared torque, the dielectric constant, and the Kerr constant angular correlation parameter.
Dissert. Abstr.

ALTERNATIVE DECOUPLINGS OF THE ELECTRON PROPAGATOR Ph.D. Thesis
Gregory J. Born 1979 175 p
Avail: Univ. Microfilms Order No. 8002837

Several alternative decouplings of the electron propagator are investigated. Operator product decouplings are reviewed and discussed. The moment conserving decouplings which consist of Pade's approximants to the propagator moment expansion are investigated. A partitioning of the superoperator Hamiltonian is invoked, and a perturbation expansion of the superoperator resolvent is developed. Renormalized decouplings are considered, and the two particle one hole, Tamm-Dancoff approximation is specifically derived and investigated. The decoupling approximations are evaluated on the basis of computational applications in which the propagator poles are compared to experimentally determined ionization energies for several molecules.
Dissert. Abstr.

STOPPING POWER MEASUREMENT IN THE 20-150 KeV REGION USING THICK TARGET BACK-SCATTERING: 1H AND 4He ON CARBON, SILICON AND GOLD Ph.D. Thesis
James David Pearce 1979 75 p
Avail: Univ. Microfilms Order No. 8003173

Stopping powers for 20-150 keV hydrogen and helium ions in carbon (graphite), silicon and gold were determined using thick target backscattering in an effort to assess the applicability and/or limitations of the technique for performing absolute stopping power measurements in the intermediate and low energy regions. Present calculations (which have an estimated probable error of less than 5%) are in good agreement with other measurements performed on 'bulk' type targets, but are significantly higher than those reported from thin film measurements. Due to the scarcity of stopping power data in the low and intermediate energy regions for bulk targets, much more experimental work is required before definite conclusions can be reached concerning the discrepancies in the measured stopping powers.

A MOLECULAR THERMODYNAMIC MODEL FOR AQUEOUS SOLUTIONS OF NONPOLAR COMPOUNDS AND MICELLE FORMATION Ph.D. Thesis
Robert James Brugman 1979 297 p
Avail: Univ. Microfilms Order No. 8002839

A thermodynamic process for micellization is developed which provides a basis for better understanding of molecular mechanisms important in the formation of micelles as well as other processes of aqueous solution. The foundation of a model of the micelle formation process is a unified molecular thermodynamic theory of aqueous solutions. For spherical gases, a modification of scaled particle theory is used for the excluded volume contribution while a mean field theory approach is used for intermolecular interactions. Extension of the model to aliphatic hydrocarbon solutes required development of an expression for the total interaction energy between a spherocylindrical solute and a spherical solvent. A primitive model for the thermodynamic properties of ionic micellization is tested using the aqueous solubility model and electrostatic theories.

SPIN WAVES IN ITINERANT ELECTRON SPIN DENSITY WAVE STATES
R. Kishore Oct. 1979 19 p refs Revised Submitted for publication
(INPE-1594-RPE/080-Rev) Avail: NTIS HC A02/MF A01

The transverse dynamical susceptibility and the spin wave stiffness constant of spin density wave states in itinerant electron systems are studied. The Hamiltonian is transformed by using a transformation which rotates the spin coordinate system locally, so that the new z direction lies in the direction of the local spin. For the transformed Hamiltonian, a self consistent many body theory is exploited to derive an exact expression for the transverse dynamical susceptibility. From the long wave length limit of the spin wave spectrum, given by the poles of the transverse dynamical susceptibility, an exact formula for the spin wave stiffness constant is obtained. Within the Hartree-Fock approximation, it reduces to the Fisher's formula for antiferromagnets.

MECHANISMS OF MULTIPHOTON DISSOCIATION OF MOLECULAR IONS Summary Report, Nov. 1978 - Nov. 1979
Michael J. Coggiola and James R. Peterson Nov. 1979 4 p
(Contract N00014-76-C-1035)
(AD-A077227) Avail: NTIS HC A02/MF A01 CSCL 07/5

This report discusses the dissociation of molecular ions resulting from infrared photon absorption by highly vibrationally excited molecular ions. Photofragments will be identified and their dissociative lifetime determined where possible. Measurements will also be made of the fragment translational energy distribution. Results to date on ions such as CF3I-, CF3Br-, and C3F6- show that a strong correlation exists between this single photon dissociation process and the final step of multiphoton dissociation. Preliminary analysis indicates that the dissociation dynamics follow a simple statistical mechanism.

THE EFFECT OF ELECTROSTATIC FIELDS ON REACTING MOLECULES Final Report, 1978 - 1979
Alan B. Whiting May 1979 31 p refs
(AD-A077581; USNA-TSPR-102) Avail: NTIS HC A03/MF A01 CSCL 07/3

The work synthesizes some model compounds whose structure provides a dipole for interaction with electric fields. The Diels-Alder addition of furan to maleic anhydride and 6,6-dimethylfulvene to maleic anhydride in electric fields of 0, 240, and 350 V/cm were studied, and they were set to react in a cell in which a static electric field was maintained. It was found that the furan addition was uneffected by the fields, but that the proportion of exo to endo isomers of the 6, 6-dimethylfulvene product changed in a qualitatively predictable way. The details are described in the papers.

(Contract N00014-77-C-0553)
(AD-A075830) Avail: NTIS HC A03/MF A01 CSCL 07/4

A theory of saturation spectroscopy in three-level gas vapor systems, including collisional effects, is presented. Using a model of collisions in which they are phase-interrupting in their effect on level coherences and velocity-changing in their effect on level population densities, we calculate the absorption profile of a weak probe field on a given transition when an arbitrarily strong pump field acts on a coupled transition. Line shapes are derived for an arbitrary collision kernel describing the velocity-changing collisions, and these line shapes are evaluated for the collision kernel proposed by Keilson and Storer. Various limiting forms for the line shapes are derived and representative line shapes are displayed. Several new features of the line shapes, including collisionally-induced increased probe absorption are discussed. The line shapes are seen to reflect the various collisonal processes that may occur in atomic or molecular systems.

A CRUCIAL DEMONSTRATION OF STRONG COLLISION BEHAVIOR OF VIBRATIONAL ENERGY FOR GAS-SURFACE COLLISIONS
N. C. Flowers, F. C. Wolters, D. F. Kelley, and B. S. Rabinovitch. 1 Dec. 1979. 9 p. refs.
(Contract N00014-75-C-0690)
(AD-A078800; TR-14) Avail: NTIS. HC A02/MF A01. CSCL 20/13.

The Variable Encounter Method was applied to the study of the transient region in vibrational accommodation of reacting cyclobutene at surfaces. Collision efficiency declines with rise of temperature. Surface collisions are more efficient than binary gas phase encounters and, at temperatures below 450 K, the wall behaves like a theoretical strong collider. GRA

THE KINETICS OF ION MOTION IN CaF2:Er. Final Report, 1978-1979.
8 Jun. 1979. 64 p. refs.
(AD-A077555; USNA-TSPR-97) Avail: NTIS. HC A04/MF A01. CSCL 20/6.

Optical density versus wavelength was measured for CaF2:Er(3+) crystals as a function of the temperature to which the crystals were heated prior to quenching. The quenching of the crystals had the effect of freezing in the high temperature equilibrium defect configurations in the crystal. The results obtained support assignments of the optical absorption lines to various defect configurations. It was observed that the absorption line at 537.43 nm increased in height by a factor of about 20 as a result of heating and quenching, supporting the assumption that it is the result of a monomer defect site. The behavior of the absorption lines at 537.06 nm and 537.92 nm support the models that these lines are due to low order clusters. The equilibrium among the defects of the CaF2:Er crystals can be described by an Arrhenius process characterized by an activation energy of 1.26 + or - 0.02 eV. The equilibrium, characteristic of the temperature from which the crystal was quenched, has been modeled to be established by mobile interstitial fluorines. GRA

T[illegible]PHYSICS OF SPIN-POLARIZED ATOMIC VAPORS. Final Report, 1 Mar. 1974 - 28 Feb. 1979.
W. Happer. Aug. 1979. 15 p. refs.
(Grant AF-AFOSR-2685-74)
(AD-A078589; AFOSR-78-1308TR) Avail: NTIS. HC A02/MF A01. CSCL 20/10.

The overall objective of the work supported by the Air Force Office of Scientific Research grant has been to explore the basic physical properties of spin polarized atomic vapors. These systems are of considerable interest to the civilian and military sectors of our society because they can be used to make very precise measurements of time, absolute rotation rates, and electromagnetic fields. For example, the U.S. time standard is the atomic cesium hyperfine frequency; very precise atomic frequency standards are used in satellites and on Earth for a wide variety of uses. Optically pumped magnetometers are used by the oil and mining industry for prospecting, by archaeologists for locating lost cities and sunken treasure ships, and by the navy for location of submarines. Optically pumped systems are currently being developed for use as gyroscopes which may have real advantages in terms of ruggedness and economy. In spite of the widespread practical utility of these systems, there is only limited research going on the related areas. There are no more than a dozen active research groups world wide and most are in foreign countries, including several excellent laboratories in the Soviet bloc. The goal of this work has been to maintain a center of excellence for the study of spin polarized atomic vapors, to ensure that outstanding students are introduced to the field from time to time and to coordinate our research activities with the needs of industrial and government laboratories for critical information and the needs of the university for high-quality basic research. BROAD BEAM ION SOURCE OPERATION WITH FOUR COMMON GASES
Sung-Jae Pak and James R. Sites. Sep. 1979. 21 p.
(Contract N00014-76-C-0976; Grant NsG-3167; RR0210203)
(NASA-CR-162801; AD-A077561; SF24; SF-24) Avail: NTIS. HC A02/MF A01. CSCL 20/8.

A Kaufman-type broad beam ion source, used for sputtering and etching purposes, has been operated with Ar, Kr, O2 and N2 gas inputs over a wide range of beam energies (200-1200 eV) and gas flow rates (1-10 sccm). The maximum ion beam current density for each gas saturates at about 2.5 mA/sq. cm. as gas flow is increased. The discharge threshold voltage necessary to produce a beam and the beam efficiency (beam current/molecular current), however, varied considerably. Kr had the lowest threshold and highest efficiency, Ar next, then N2 and O2. The ion beam current varied only weakly with beam energy for low gas flow rates, but showed a factor of two increase when the gas flow was higher. GRA

LONG DURATION EXPOSURE EMULSION PACKAGE (LDEEP). Interim Report.
R. C. Filz. 19 Jul. 1979. 15 p.
(AF Proj. 2311)
(AD-A077362; AFGL-TR-79-0156; IP-277) Avail: NTIS. HC A02/MF A01. CSCL 20/8.

An exposure package has been designed to obtain measurements of trapped proton fluxes utilizing the NASA Long Duration Exposure Facility. The techniques are similar to those used in the 1960's to obtain trapped proton fluxes from Air Force recoverable satellites. The main novelty consists in the development of proton sensitive plastic detectors capable of withstanding the six month exposure planned for LDEF. At the planned LDEF altitude of 450 km, unshielded nuclear emulsion would become grossly over-exposed in six months. Early designs for LDEEP consisted of shielded emulsons with narrow cylindrical openings to allow trapped protons to enter. The discovery of the CR39 plastic detector by Cartwright et al opens up a new solution to this problem. The potential for obtaining the first reliable measurements of inner zone trapped protons of 1 to 10 Mev energy is discussed. Earlier electronic counter measurements are quite uncertain, and the NERV emulsion results covered are far too brief a time interval and were spatially limited. GRA

EXPERIMENTAL AND THEORETICAL DETERMINATION OF THE VELOCITY DEPENDANCE OF THE SCATTERING CROSS SECTIONS IN MONOMER-DIMER NOBLE GAS COLLISIONS. Ph.D. Thesis - Goettingen Univ., West Germany [EXPERIMENTELLE UND THEORETISCHE BESTIMMUNG DER GESCHWINDIGKEITSABHAENGIGKEIT DES TOTALEN STREUQUERSCHNITTES BEI EDELGASATON-EDELGASDIMER STOESSEN]
Michael Dueker. Sep. 1978. 56 p. refs. In GERMAN.
(MPIS-19/1978) Avail: NTIS. HC A04/MF A01; Fachinformationszentrum, Goettingen, West Germany DM 10.95.

The total and integral scattering cross sections of noble gases were measured, using in the primary beam Ar, Kr, and Ne atoms, and for the secondary beam the dimers Ar2, Kr2, and Ne2. The cross section ratio obtained for each dimer referred to the monomers was compared with theoretically calculated values. The potential used for calculating the dimer scattering cross section was obtained by the sum of two known potentials, introducing some simplifying hypotheses. Charts are presented showing good agreement between experimental and calculated results. Author (ESA)

PION SCATTERING FROM THE MASS THREE SYSTEM. Ph.D. Thesis.
Jose Pablo Mestre. 1979. 116 p.
Avail: Univ. Microfilms. Order No. 8004964.

Realistic nuclear form factors were used to compute elastic and charge exchange pion scattering angular distributions from He-3 in the Glauber multiple scattering formalism. The resulting angular distributions were compared with those using the Schiff model wave function. Although both nuclear structure descriptions gave equivalent scattering shapes in the forward direction, using realistic nuclear form factors resulted in better agreement with experiment for backward angles. Two different pion nucleon approximations were studied. The first, a Gaussian pi-N parametrization, exhibited too strong a fall-off after 60 degrees, thereby deviating drastically from the experimental picture in the backward hemisphere. The second, a parametrization which included S and P partial waves, gave a much better description of the scattering. Dissert. Abstr.

FIELD THEORETIC MODEL OF LOW-ENERGY PION-NUCLEON ELASTIC SCATTERING. Ph.D. Thesis.
Robert John McLeod. 1979. 104 p.
Avail: Univ. Microfilms. Order No. 8003165.

A relativistic model of pion-nucleon elastic scattering is derived by assuming pseudoscalar coupling and suppressing the contribution of the intermediate antinucleon states. This model is suggested as a relativistic extension of the Chew-Low model, which contains no antinucleons. The antinucleons in the pseudoscalar coupling were considered to give only a small contribution in the P waves, while being responsible for a large S wave phase shift not observed experimentally. Starting with the transition matrix for the lowest order Feynman graphs of the pseudoscalar coupling, the propagator for the intermediate nucleons is decomposed and the antinucleons separated. The transition matrix is then decomposed into its isospin and angular momentum channels. These Born termpartial wave helicity amplitudes are used as driving terms of a partial wave N over D method. Crossing is included in the infinite mass limit only. The results for crossing and the noncrossing approximation are examined. Dissert. Abstr.

A NODAL GREENS FUNCTION METHOD FOR MULTI-DIMENSIONAL NEUTRON DIFFUSION CALCULATIONS. Ph.D. Thesis.
Richard Douglas Lawrence. 1979. 195 p.
Avail: Univ. Microfilms. Order No. 8004214.

Green's functions for one-dimensional in-group diffusion-removal operators are used to generate a coupled set of one-dimensional integral equations defined over a subdomain or node. In order to efficiently accommodate changes in the cross sections due to thermalhydraulic feedback, the formalism is developed in terms of Green's functions calculated using reference values for the cross sections. The nodes are coupled by requiring continuity of the partial currents across the nodal interfaces. The integral equations are approximated using a weighted residual procedure applied within each node. The resulting matrix equations, when solved in conjunction with the linear form of the nodal balance equation, provide the necessary additional relationships between the interface partial currents and the flux within the node. The nodal method is applied to several light water reactor benchmark problems and to a four-group LMFBR problem. Dissert. Abstr.

INTENSE RELATIVISTIC ELECTRON BEAM INVESTIGATIONS. Final Report, 1 Jul. 1976 - 30 Apr. 1979.
Wesley O. Doggett. 30 Apr. 1979. 50 p. refs.
(Contract F49620-76-C-0007; AF Proj. 2301)
(AD-A078515; AFOSR-79-1310TR) Avail: NTIS. HC A03/MF A01. CSCL 20/9.

During this period research was performed at North Carolina State on collective ion acceleration in a vacuum diode geometry and in collaboration with a group from the Naval Research Lab on collective ion acceleration within an evacuated dielectric tube. Diode voltage and current wave forms along with transmitted beam energy and current were measured for a series of linear diameters and lengths. Beam energy loss was linear at the rate of approximately 12 j/cm. For the 8.3 and 15.9 cm length tubes, the Alfen limiting current was exceeded, indicating the creator of enough plasma for some current neutralization. Below the Alfen limit the current propagates in a pinched beam. The beam from velocity was 1.4 cm/nsec. Equipment for experimental work on electron beam propagation in evacuated magnetized pipes has been assembled and a theoretical study was made of intense electron beam equilibrium in magnetized pipes using a relativistic cold fluid model. DESIGN AND PERFORMANCE OF AN EXPERIMENTAL DUAL-FREQUENCY DOPPLER LIDAR FOR REMOTE MEASUREMENT OF WIND VELOCITY. Ph.D. Thesis.
Wynn Lowell Eberhard. 1979. 216 p.
Avail: Univ. Microfilms. Order No. 8002923.

An experimental Dual Frequency Doppler Lidar (DFDL) instrument, based upon an acousto-optically modulated laser, was constructed and operated. It was capable of real time wind measurement, utilizing a minicomputer for data analysis and recording. Laboratory tests, including operation in a wind tunnel with seeded flow, confirmed the predicted differential Doppler shift. The functional dependence of signal to noise ratio on

equipment variables of the DFDL instrument were also verified in the wind tunnel. Outdoor wind measurements in both pure and hybrid DFDL configurations, with natural aerosols as targets, were performed. Good agreement was found between the lidar and a conventional anemometer adjacent to the sensed volume. Dissert. Abstr.

This technical report describes lidar measurements and results using 10.6-micrometers lidar and the SRI Mark IX (0.7- micrometers) lidar systems during the Dusty Infrared Test 1 (DIRT-I). Transmission comparisons are made between the two wavelengths with artillery barrages, TNT explosions, and oil/rubber fire-generated dust and smoke clouds in a test zone midway (1 km) along the lidar path. A target at the end of the lidar path provided a reference backscatter return for the transmission measurements. Backscatter properties of the dust and smoke clouds are also discussed. Results of the DIRT-I program indicate that the broad particle size distribution present in the dust generated produced little if any wavelength dependent transmission effects. The few observed exceptions where greater 10.6-micrometers transmission is indicated generally can be explained by the presence of wavelength-dependent smoke along the optical path, which is also generated by the detonations. Backscatter-to-transmission relationships are grossly related but, in general, are quite nonlinear, as can be expected when multiple and specular scatter by the large particles, as well as strong attenuations, are involved. The oil/rubber fire generated dense black smoke that was totally opaque to the 0.7 micrometers lidar, while the 10.6 micrometers transmission measurements indicate a transmission of approximately 6%. BIDIRECTIONAL COUPLER FOR FULL DUPLEX TRANSMISSION ON A SINGLE FIBER. Final Report, 1 May 1977 - 15 May 1979
A. R. Nelson, G. A. Gasparian, and G. W. Bickel. Aug. 1979. 190 p.
(Contract DAAB07-77-C-1798; DA Proj. 1L1-62701-AH-92)
(AD-A075467; CORADCOM-77-1798-F) Avail: NTIS HC A09/MF A01 CSCL 20/6

The primary objective of this contract is the development of a bi-directional coupler for single optical fiber transmission systems and the implementation of two such couplers in a full duplex link with simulated length of up to 8 km, 20 Mb/s data rate, and 10 to the -8th power BER. The primary approach adapted for this task is the fiber dichroic coupler. Other approaches were also investigated. When used in a duplex optical data link, this three port device constitutes a wavelength selective bi-directional coupler. GRA

DEVELOPMENT OF HIGH STRENGTH OPTICAL FIBER WAVEGUIDES USING RESIDUAL SURFACE COMPRESSION. Final Report, Jan. 1977 - May 1979
R. K. Mohr, O. H. El-Bayoumi, N. Lagakos, H. Hojaji, P. Klocek, R. Ingel, D. S. Ma, J. H. Simmons, and P. B. Macedo. Griffiss AFB, N.Y. RADC Oct. 1979. 118 p.
(Contract F19628-77-C-0084; ARPA Order 3282; AF Proj. 3282)
(AD-A078296; RADC-TR-79-252) Avail: NTIS HC A06/MF A01 CSCL 20/6

The primary objective of this project was to maximize the compressive strengthening obtained in low loss fibers made by the molecular stuffing process. The process being the doping of a porous high silica glass rod made by a phase separation and leaching process. The rod is subsequently sintered to form a solid glass prefrom from which fibers may be drawn. The ultimate goal being a fiber having greater than 100 ksi surface compression and loss less than 10 dB/km. As a major part of this effort, we have characterized the strengthening effects of compression and demonstrated that even moderate compression can be of value in many applications. Optical losses less than 10 dB/km are obtainable using molecular stuffing and we were able to produce preforms having greater than 75 ksi compression. Preforms and fibers having very high compression are difficult to produce and thus may not provide a practical method of dramatically increasing fiber strength. Surface compression on the order of 30 ksi is relatively easy to obtain, however, and compression of this magnitude can have significant effects on fatigue failure in many applications. We were able to demonstrate that fibers having surface compression showed no strength degradation when aged under load in air as long as the tensile load was less in magnitude than that of the compression. In fact, the strength of abraded samples was observed to improve with time. GRA

INVESTIGATION OF THE HOLLOW CATHODE DISCHARGE AT HIGH CURRENT DENSITY Ph.D. Thesis
Bruce Eugene Warner 1979 287 p
Avail: Univ. Microfilms Order No. 8003024

Plasma diagnostics and discharge modeling were performed on a hollow cathode discharge in helium, at current densities in excess of .01 A/sq cm. Typical discharge conditions are a cathode separation of 11 mm, helium pressure of 4-8 torr, tube voltage of 400-600 V, and tube current of up to 3 A d.c. Spectroscopic measurements of Stark broadening are discussed. Modeling of the electron energy distribution by solution of the Boltzmann equation is described. The effects of the non Maxwellian electron energy distribution on the helium excited state populations and ionization and recombination rates are calculated by a collisional-radiative model. A two fluid theory of electron and ion transport in the hollow cathode discharge is developed, which uniformly treats the sheath and negative glow regions and the (numerically) difficult region in between. It calculates the spatial variations of the electron density, ion density, electric field and potential, and ion flow velocity. Dissert. Abstr.

N80-18932 Wisconsin Univ. - Madison.
LOWER HYBRID HEATING ASSOCIATED WITH MODE CONVERSION ON THE WISCONSIN OCTUPOLE Ph.D. Thesis
Thomas Llewellyn Owens 1979 190 p
Avail: Univ. Microfilms Order No. 7928655

A series of 1-10ms pulses of up to 40kW of radio frequency power at 140MHz were launched corresponding to the hot plasma lower hybrid resonance in the octupole. Coupling efficiencies greater than 95% were achieved by proper antenna placement near the edge of the plasma radial density profile. Substantial ion body temperature increases of delta T sub i = 37 eV (delta T sub i/T sub io = 12) in a helium plasma were measured from Doppler broadening of the helium 4686 Angstrom line using a Fabry-Perot interferometer. From spatial scans of ion temperature using a miniature transverse ion energy analyzer in a hydrogen plasmas, heating efficiencies in the range of 16-50% were found. The higher efficiencies in this range occur for denser plasmas. Dissert. Abstr.

N80-18933 Wisconsin Univ. - Madison.
RADIAL CONFINEMENT OF CENTRAL CELL PLASMA IN TANDEM MIRRORS Ph.D. Thesis
Lang I. Lao 1979 178 p
Avail: Univ. Microfilms Order No. 8001155

The single particle guiding center orbit analysis is carried out both numerically and analytically. It is demonstrated numerically using the magnetic field geometry and plasma parameters of the tandem reactor. The radial losses of particle and energy are studied in the fluid approximation. A set of transport equations are obtained by assuming the magnetic field in the three mirror cells to be square wells. A one dimensional tandem transport code was developed from a Tokamak code. Numerical solutions are obtained using parameters of PHAEDRUS and classical, resonant, and Bohm transport coefficients. It is demonstrated using the parameters of UW-TMR and resonant plateau ion transport coefficients that resonant radial transport can substantially lower the Q values of tandem mirror reactors. Dissert. Abstr.

N80-18934 Illinois Univ. at Urbana-Champaign.
MONTE CARLO SIMULATION OF NEUTRAL-BEAM INJECTION FOR MIRROR FUSION REACTORS Ph.D. Thesis
Ronald Lee Miller 1979 154 p
Avail: Univ. Microfilms Order No. 8004231

Energetic neutral-beam particles interact with the target plasma through electron-atom and ion-atom collisional ionization as well as ion-atom charge-transfer (charge-exchange) collisions to give a fractional trapping of the neutral beam and a loss of charge-transfer-produced neutrals which escape to bombard the reactor first wall. Appropriate interaction cross sections for these processes are calculated for the assumed anisotropic, non-Maxwellian plasma ion phase-space distributions. The target plasma is assumed to be confined by a Yin-Yang mirror-coil configuration and has distinct radial and axial density profiles as modeled in steady-state and three spatial dimensions. The energy and angular distributions of a population of neutral test particles are computed to give statistical estimates of neutral-beam trapping efficiency, non-uniform first-wall surface heating rates and first-wall sputtering-erosion for use in engineering-design calculations. A guide to the NUBIN computer is included. Dissert. Abstr.

N80-18935 Florida Univ., Gainesville.
STEADY-STATE AND TIME-DEPENDENT BEHAVIOR OF FUSION-FISSION HYBRID SYSTEMS Ph.D. Thesis
William Gerard Vernetson 1979 445 p
Avail: Univ. Microfilms Order No. 8002909

A stability analysis of point model systems representing pure fusioning plasmas as well as coupled fusion-fission systems was examined. The stability criteria for these systems were derived for constant plasma confinement conditions based on engineering perturbations of the system feedrate. The results of linearized point model plasma stability analysis of the thermal instability were shown to be applicable to hybrid plasmas and to be attainable from considerations of engineering related perturbations in the extrinsic plasma feedrate variable. A Tokamak fusion-fission hybrid design was selected for further analysis. The modeled hybrid system in linearized form was found to be stable provided certain hybrid plasma temperature and confinement time limits are met. Hybrid plasma behavior was examined under transient and overpower conditions. Dissert. Abstr.

RELATIVISTIC NONLINEAR ELECTRON CYCLOTRON WAVES IN PLASMA
Abraham C.-L. Chian and Ruth B. Miranda Nov. 1979 10 p refs Submitted for publication
(INPE-1625-RPE/090) Avail: NTIS HC A02/MF A01

The propagation of relativistic nonlinear electron cylcotron waves in a cold streaming plasma is studied. The dispersion relation is analyzed and expressions for the resonance and cut-off frequencies are obtained. It is shown that the nonlinear dispersion relation for a streaming plasma can be obtained from the nonlinear dispersion relation for a stationary plasma by a Lorentz transformation. K.L.

WAVES IN HOT MAGNETIZED PLASMAS
J. A. Bittencourt Sep. 1979 72 p Revised
(INPE-1575-RRP/072) Avail: NTIS HC A04/MF A01

The fundamentals of plasma physics are considered. The theory of wave propagation in a hot plasma is extended to the case of a hot plasma immersed in an externally applied magnetic field. The characteristics of wave propagation in a plasma consisting of mobile electrons in a neutralizing background of stationary ions are analyzed in some detail for directions either parallel or perpendicular to the magnetic field. J.M.S.

PARTICLE INTERACTIONS IN PLASMAS
J. A. Bittencourt Oct. 1979 48 p Revised
(INPE-1589-RPE/076) Avail: NTIS HC A03/MF A01

The dynamics of binary collisions are described and the concepts of differential scattering cross section, total scattering cross section, and momentum transfer cross section are introduced. These cross sections are explicitly calculated for the cases of the hard sphere model and of the Coulomb potential, due to the Debye shielding, are incorporated on the cross sections for the Coulomb potential. J.M.S.

THERMAL CONDUCTIVITIES AND COEFFICIENTS OF THERMAL DIFFUSION OF A HIGH-TEMPERATURE PLASMA IN A UNIFORM MAGNETIC FIELD
Shobu Kaneko and Akihiro Yamao Jan. 1980 15 p refs
(IPPJ-432) Avail: NTIS HC A02/MF A01

The Boltzmann equation was used to evaluate the thermal conductivities and the coefficients of thermal diffusion of a plasma composed of electrons and singly charged positive ions. The distribution functions for electrons and ions are expanded in terms of Sonine's polynomials. Numbers of the expansion terms are changed from 6 to 50, and the convergence of this method is examined. Both the thermal conductivities and the coefficients of thermal diffusion evaluated from the expansions with 50 terms are shown to have accuracy of at least six decimal places for various strength of magnetic field. A.R.H.

THEORETICAL ANALYSIS OF THE RESONANCE CONE IN AN INHOMOGENEOUS MAGNETOPLASMA COLUMN
H. Sanuki, T. Watanabe, and T. Ohnuma Jan. 1980 26 p refs
(IPPJ-433) Avail: NTIS HC A03/MF A01

The three dimensional behaviour of the high frequency resonance cone was investigated using an inhomogeneous slab magnetoplasma model under the quasistatic approximation and neglecting ion motion. The effect of finite k sub y and electron thermal motion are considered numerically, revealing that the cone angle is shifted to a slightly smaller angle and the reflection point also shifts toward the high density region compared with the results under the cold plasma approximation. MONTE CARLO SIMULATION OF PLASMA CONFINEMENT IN MIRROR AND CUSP FIELDS
Yukiharu Ohsawa and Tetsuo Kamimura Dec. 1979 28 p refs
(IPPJ-431) Avail: NTIS HC A03/MF A01

Plasma confinement times for mirror and cusp devices are investigated by using a Monte Carlo simulation model which can include the effects of binary collisions, arbitrary spatial change in the magnetic field, and external electric fields. For a mirror, the simulation results are in good agreement with theory. For a cusp (without an external electric field), the confinement time is found to be proportional to the plasma radius divided by the average velocity, which is approximately the same as the theoretical confinement time, but is quite different from that obtained from the Nagoya experiments. Collision effects are also considered. A.R.H.

HIGH PRESSURE LASER PLASMA STUDIES Final Report
W. E. Wells 1980 63 p refs
(Grant NsG-1383)
(NASA-CR-162824) Avail: NTIS HC A04/MF A01 CSCL 20I

The operation of a nuclear pumped laser, operating at a wavelength of 1.79 micron m on the 3d(1/2-4p(3/2) transition in argon with helium-3 as the majority gas is discussed. The energy pathways in He-Ar gas were investigated by observing the effects of varying partial pressures on the emissions of levels lying above the 4p level in argon during a pulsed afterglow. An attempt is made to determine the population mechanisms of the 3d level in pure argon by observing emission from the same transition in a high pressure plasma excited by a high energy electron beam. Both collisional radiative and dissociative recombination are discussed. A.R.H.

EXPERIMENTAL RESULTS ON PLASMA INTERACTIONS WITH LARGE SURFACES AT HIGH VOLTAGES
Norman T. Grier 1980 12 p refs Presented at 18th Aerospace Sci. Meeting, Pasadena, Calif., 14-16 Jan. 1980; sponsored by AIAA
(NASA-TM-81423; E-346) Avail: NTIS HC A02/MF A01 CSCL 20I

Multikilowatt power levels for future payloads can be more efficiently generated using solar arrays operating in the kilovolt range. This implies that large areas of the array at high operating voltages will be exposed to the space plasma environment. The resulting interactions of these high voltage surfaces with space plasma environments can seriously impact the performance of the satellite system. The plasma-surface interaction phenomena were studied in tests performed in two separate vacuum chambers, a 4.6 m diameter by 19.2 long chamber and a 20 m diameter by 27.4 m long chamber. The generated plasma density was approximately 1x10 to the 4th power/cu cm. Ten solar array panels each with areas of 1400 sq cm were used in the tests. Nine of the solar panels were tested as a composite unit in the form of a 3x3 solar panel matrix. The results from all the tests confirmed small sample tests results: insulators were found to enhance the plasma coupling current for high positive bias and arcing was found to occur at high negative bias. A.R.H.

SOME EXPERIENCE WITH ARC-HEATER SIMULATION OF OUTER PLANET ENTRY RADIATION
W. L. Wells and W. L. Snow Jan. 1980 30 p refs
(NASA-TM-80192) Avail: NTIS HC A03/MF A01 CSCL 14B

An electric arc heater was operated at 800 amperes and

100,000 pa (1 atm) with hydrogen, helium, and two mixtures of hydrogen and helium. A VUV-scanning monochromator was used to record the spectra from an end view while a second spectrometer was used to determine the plasma temperature using hydrogen continuum radiation at 562 nm. Except for pure helium, the plasma temperature was found to be too low to produce significant helium radiation, and the measured spectra were primarily the hydrogen spectra with the highest intensity in the pure hydrogen case. A radiation computer code was used to compute the spectra for comparison to the measurements and to extend the study to simulation of outer planet entry radiation. Conductive cooling prevented ablation of phenolic carbon material samples mounted inside the arc heater during a cursory attempt to produce radiation absorption by ablation gases.

EVOLUTION OF TURBULENCE BY THREE-DIMENSIONAL NUMERICAL PARTICLE-VORTEX TRACING
Benoit Couet. Aug. 1979. 145 p. refs.
(Contract N00014-78-C-0272)
(AD-A076121; SU-IPR-793) Avail: NTIS HC A07/MF A01 CSCL 20/9

A new method for the numerical simulation of three-dimensional incompressible flows is described. Our vortex-in-cell (VIC) method traces the motion of the vortex filaments in the velocity field which these filaments create. The velocity field is not calculated by creating a mesh-record of the vorticity field, then integrating a Poisson's equation via the fast Fourier transform to get the stream function and generating a mesh-record of the velocity field. The computed scales of motion are assumed to be essentially inviscid. Viscous or subgrid-scale effects are incorporated into a filtering procedure in wave vector space. Three computational experiments were pursued in three-dimensional space. The velocity of translation of a single vortex ring was measured and compared with the Biot-Savart law. Next, the evolution in time of an infinite periodic array of closed vortex filaments (Taylor-Green) was studied. The third simulation follows a mixing layer from an initial state of uniform vorticity with two- and three-dimensional small perturbations. Streamwise perturbations lead to the usual roll-up of vortex patterns with spanwise uniformity. GRA

THEORY OF SECOND HARMONIC ELECTRON CYCLOTRON RESONANCE HEATING OF TOKAMAK PLASMA. Interim Report
Bertram Hui, Edward Ott, K. R. Chu, and Thomas Antonsen (MIT, Cambridge, Mass.). 26 Oct. 1979. 16 p. refs.
(AD-A077538; AD-E000336; NRL-MR-4104) Avail: NTIS HC A02/MF A01 CSCL 20/9

A theoretical and numerical study of Tokamak plasma heating by the second harmonic of the electron cyclotron resonance is presented. It is found that the extraordinary mode is very efficiently absorbed. In contrast to previous calculations, it is also found that the ordinary mode is well absorbed at oblique incidence to the toroidal magnetic field. This finding indicates the feasibility of heating devices of higher densities than would otherwise be possible. GRA

METHOD AND APPARATUS FOR SLICING CRYSTALS. Patent
John S. J. Benedicto, Bruce E. Woodgate, and Frederick C. Hallberg, inventors (to NASA). Issued 22 Jan. 1980. 5 p. Filed 15 May 1978. Supersedes N78-24386 (16 - 15, p. 1978)
(NASA-Case-GSC-12291-1; US-Patent-4,184,472; US-Patent-Appl-SN-906298; US-Patent-Class-125-23R; US-Patent-Class-51-235; US-Patent-Class-83-152; US-Patent-Class-83-870; US-Patent-Class-269-21) Avail: US Patent and Trademark Office CSCL 20B

The crystal slicing method is described as follows. A crystal is sliced in a plane parallel to flat, opposed parallel end faces of the crystal. The end faces of the crystal are gripped by a pair of opposed, perforated platens of a pair of vacuum chambers, one of which is translatable relative to the other. A blade cuts the crystal through the desired plane. A spring biases one of the vacuum chambers away from the other vacuum chamber while both of the faces are gripped by the vacuum chambers and the blade is cleaving the crystal. A sliced portion of the crystal gripped by one of the vacuum chambers is pulled away from the remainder of the crystal gripped by the second vacuum chamber when the crystal was cleaved by the blade through the plane. SILICATE MINERALS AT PRESSURE: CRYSTAL STRUCTURES AND ELASTICITY. Ph.D. Thesis
Louise Levien. 1979. 228 p.
Avail: Univ. Microfilms Order No. 8004410

Unit-cell and crystal structure parameters were measured on single crystals of four minerals mounted in diamond-anvil high pressure cells. Isothermal bulk moduli and their pressure derivatives were calculated by fitting the pressure and unit-cell volume data to a Birch-Murnaghan equation of state. The single-crystal moduli of diopside were determined using a method based on the phenomenon of Brillouin scattering. All Si-O-Si angles in these minerals decreased with increased pressure; that in quartz changes most. As pressure is increased, small decreases in the average silicate tetrahedral bond lengths took place in all four crystallographically unique tetrahedra studied. Larger decreases were observed in the average polyhedral distances in diopside. Dissert. Abstr.

N80-18953 Lyon Univ. (France).
CRYSTAL SITES MODELS. Ph.D. Thesis
Yves Emile Boudeville. 1977. 207 p.
Avail: Univ. Microfilms Order No. 8003229

The crystalline site where the doping transition metal ion is located in the crystalline matrix is examined. The features of these sites are found by models growing from six to two thousand atoms by applying parametrized crystal field theory. Variation laws for parameters are established according to the size of the models. For 2000 atoms model, conventional values of parameters are found accordingly to crystal field theory. An approach of (010) surface, defects, and holes is performed. In order to correlate catalytic selectivity and covalency of binding, studies on the electronic state of sites and the atoms, charges are performed on EHT-SCCC-MO models from 7 to 17 atoms, including 3 transition metal ions. These calculations are compared to more extended CNDO/2 studies using 33 atoms with 11 transition metal cations. Different forms of covalent binding are analyzed. Dissert. Abstr.

ULTRAVIOLET SPECTROSCOPY OF ELECTRON TRAPPING CENTERS IN THERMALLY GROWN SiO FILMS Ph.D. Thesis
Dennis Dean Rathman 1979 246 p
Avail: Univ. Microfilms Order No. 8003066

Electron trapping centers found in thermally grown silicon dioxide films were studied. Thick SiO2 films contain a number of distinct electron trapping centers which were characterized by such quantities as their capture and photoionization cross sections. These quantities were determined from the study of the kinetics of both the trap filling and trap emptying processes. The kinetics of these processes were interpreted in terms of models incorporating first order rate equations. The photon energy dependence of the emptying process was studied for the photon energy range of 4 to 7 eV. Three distinct electron trapping centers were observed in wet, thermal oxide films which were not previously characterized by such quantities listed above. Dissert. Abstr.

N80-18956 Lehigh Univ., Bethlehem, Pa.
BOUND SMALL POLARON TRANSITIONS IN MAGNESIUM OXIDE AND BERYLLIUM OXIDE Ph.D. Thesis
Lewis Howard Mammel, Jr. 1979 162 p
Avail: Univ. Microfilms Order No. 8003063

An extended version of the bound small polaron model was used to calculate optical absorption spectra of BeO:[Li]O, MgO:[Li]O, and MgO:V(-). Zeroth and first moment shifts of the magnetic circular dichroism spectra were calculated for MgO:[Li]O. The extended model includes O(-) ion pi orbitals as well as pi orbitals and allows for dipole matrix elements arising from direct overlap as well as from admixture. The calculations were made using a Monte Carlo method whereby the vibrational motion of the lattice is taken into account by calculating electronic transitions at many different randomly distributed lattice configurations using a restricted form of vibronic coupling. It was found that important features of the spectra remain unaccounted for in spite of the extensions employed in the model. A suggestion is made for further work which might provide a more complete interpretation. Dissert. Abstr.

HYDROGEN CHEMISORPTION AND OXIDATION ON TRANSITION METAL CARBIDES Ph.D. Thesis
James Roger Bethin 1979 91 p
Avail: Univ. Microfilms Order No. 8004134

The catalytic activity of tungsten carbide was investigated with emphasis on the possible influence of point defects. The chemisorption of hydrogen on tungsten carbide and titanium oxycarbides was studied with differential scanning calorimetry. The catalytic activity of these materials for oxidation of hydrogen was determined by potentiostatic steady state and potentiodynamic measurements in acid electrolyte. Compositions of tungsten carbide surfaces were determined by X-ray photoemission and related to the catalytic behavior. Titanium oxycarbide surfaces were analyzed by Auger electron spectroscopy. Of the carbides tested only one WC preparation was able to chemisorb hydrogen. Both WC powders investigated catalyzed hydrogen oxidation with similar specific activities. Dissert. Abstr.

N80-18959 Cornell Univ., Ithaca, N. Y.
STRUCTURAL AND TRANSPORT PROPERTIES OF SIMPLE METALS UNDER HIGH PRESSURE Ph.D. Thesis
Joseph Benjamin Wai Tung Cheung 1979 232 p
Avail: Univ. Microfilms Order No. 8003906

The effect core polarization fluctuations have on the total energy of a metal were reviewed. A generalized Hamiltonian was analyzed with emphasis on the interactions of the core electrons. Perturbation theory was used to yield expressions for the contributions to the total energy. It is found that the core fluctuations, in addition to producing screened van der Waals interactions between the ions, also screen the various interactions in the metal and that the screening effects can be incorporated into a core dielectric function. An interpolation formula for the core dielectric function was obtained and the results were applied to the calculation of the equation of state of potassium. Results indicate that in potassium core effects contribute rather significantly to the energy and the equation of state. Dissert. Abstr.

N80-18960 California Univ., Santa Barbara.
HIGH TEMPERATURE EPR STUDY OF SUPERIONIC CONDUCTORS AND STRONGLY EXCHANGE COUPLED PARAMAGNETS Ph.D. Thesis
Cesar Augusto Por Deus Evora 1978 145 p
Avail: Univ. Microfilms Order No. 8003034

High temperature electron paramagnetic resonance (EPR) in solids was studied. The aspects covered were: (1) F(-) anion diffusion and the dynamic modulation of the crystalline field as it affects the ERP of a Mn2(+) impurity in the superionic conductor PbF2; and (2) the persistence of superexchange into the molten state of a paramagnet (MnF2), using fast relaxing, exchange coupled impurities to distinguish the effects of exchange from motional narrowing of the EPR above the melting point, T sub M. In the superionic conductor PbF2 the collapse of the F19 transferred hyperfine structure of the Mn2(+) EPR above 400 K is explained by F(-) anion diffusion. Above 620 K a linewidth dependence on the nuclear spin quantum number M55 of each Mn55 hyperfine component was observed. Using the Redfield relaxation theory it shown that this effect is caused by the dynamic modulation of the crystal field. Dissert. Abstr.

N80-18961 Princeton Univ., N. J.
ELECTROCHEMICAL KINETICS AT METAL AND SEMICONDUCTOR SURFACES: ROLE OF INTERFACIAL ENERGY BARRIERS Ph.D. Thesis
Harold Edward Hager 1979 157 p
Avail: Univ. Microfilms Order No. 8003786

The incorporation of ionic adsorption phenomena into electrochemical kinetic expressions is examined. Here the influence of specifically adsorbed ions upon the potential structure of the double layer is determined. This result is employed to interpret solution concentration effects observed in several reported hydrogen oxidation/reduction studies on platinum. The role of ionic half cell reaction products upon the performance characteristics of a photoassisted electrochemical cell is analyzed. The stability of semiconductor materials employed as photoelectrodes in water electrolysis systems is investigated. The feasibility of employing simple coating schemes to stabilize photocorrodible photoanode materials is discussed. Charge transport and electron/hole pair recombination in a photoassisted electrochemical cell are treated theoretically. An experimental program is outlined for the determination of the recombination velocity as a function of the system bias, illumination intensity, and electrolyte. Dissert. Abstr.

AN EXPERIMENTAL STUDY OF THE PHASE SEPARATION PROCESS NEAR THE CRITICAL POINT Ph.D. Thesis
Arthur Jay Schwartz 1979 134 p
Avail: Univ. Microfilms Order No. 8004876

A method developed for performing quenches on samples in their critical region and probing the phase separation process by light scattering is described. The spinodal ring, a maximum as a function of angle in the scattered cross section as measured by light scattering was examined. The maximum intensity of the scattering as well as its angular position were studied as a function of quench depth and composition. The limits of metastability were probed by quenching samples held off the critical isochore until spontaneous phase separation occurred. Dissert. Abstr.

N80-18963 Lehigh Univ., Bethlehem, Pa.
DEEP LEVEL TRANSIENT SPECTROSCOPY STUDIES OF RADIATION INDUCING DEFECTS IN SILICON Ph.D. Thesis
John Richard Troxell 1979 338 p
Avail: Univ. Microfilms Order No. 8003072

The use of deep level transient spectroscopy (DLTS) in characterizing lattice defects produced in silicon by electron irradiation both at room temperature and in situ at liquid helium temperatures is discussed. The electrical properties of the defects are cataloged and correlated with the results of electron paramagnetic resonance studies in order to identify the defect levels. Schottky barrier diodes, diffused, and ion implanted junctions are studied. Studies of the isolated vacancy, interstitial boron, and interstitial aluminum are reported. The construction of the DLTS spectrometer and the fabrication of the samples are considered. Dissert. Abstr.

N80-18964 Illinois Univ. at Urbana-Champaign.
STUDIES IN THE ELECTRONIC STRUCTURE OF MATTER Ph.D. Thesis
Coenraad Albert Swarts 1979 349 p
Avail: Univ. Microfilms Order No. 8004284

The results of various theories for the angular distribution of electrons photoemitted from the outer most p shell of rare gas atoms are compared. The theories compared are: (1) the local density theories of Slater and of Hohenberg, Kohn and Sham; (2) the pseudopotential method; (3) Hartree-Fock theory; and, (4) Amusia's random phase approximation with exchange. It is shown that the local density theories, although simple, generally fail to produce a reliable cross section. Extended Horckel theory is applied to GaAs, GaP and to the nitrogen isoelectronic trap in GaAs and GaP. The computed perfect crystal band structures are found to be in reasonable agreement with those computed with empirical pseudopotentials. By means of model calculations for an independent electron metal, exact lineshapes for the photon absorption, emission, and photoemission spectra of deep core states are obtained. Dissert. Abstr.

SEMICONDUCTOR ELECTRODES 25: THE P-GaAs/HEATYL VIOLOGEN SYSTEM. PHOTOELECTROCHEMICAL CELLS AND PHOTOELECTROCHROMIC DISPLAYS Technical Report, 1 Sep. 1979 - 31 Aug. 1980
Benjamin Reichman, Fu-Ren F. Fan, and Allen J. Bard 1 Oct. 1979 30 p refs Submitted for publication
(Contract N00014-78-C-0592)
(AD-A075812; TR-2) Avail: NTIS HC A03/MF A01 CSCL 20/12

The photoreduction of aqueous solutions of 1,1:-diheptyl-4,4:-bipyridyl (heptyl viologen, HV(2-)) bromide on p-GaAs was investigated. Under irradiation with light of wavelengths below 885 nm, the photoreduction of HV(2-) to form a precipitate of violet HVBr occurs on p-GaAs at a potential of approx 400 mV more positive than the reversible potential of the HV(2-)/HVBr couple on Pt. Oxidation of HVBr back to soluble HV(2-) occurs in the dark at more negative potentials. Photoelectrochemical low capacity storage cells based on this reaction with Cu, Ni, or HxNb2O5 counter electrodes were constructed. In such cells, under illumination, the p-GaAs electrode behaves as the cathode, a photovoltage develops and current flows in the external circuit, while HVBr precipitates on the electrode surface and the counter electrode is oxidized. In the dark, the current flows in the opposite direction, the p-GaAs is the anode and reduction occurs at the counter electrode. Such a cell also produces an alternating electrical output under periodic illumination. Photoelectrochromic cells based on this reaction and utilizing simultaneous addressing with light and electrical signals are also proposed. GRA

APPLICATIONS OF THE MOESSBAUER EFFECT TO THE STUDY OF MIXED-VALENCE COMPOUNDS
David B. Brown and James T. Wrobleski Nov. 1979 33 p refs
(Contract N00014-75-C-0756)
(AD-A077640; TR-19) Avail: NTIS HC A03/MF A01 CSCL 07/3

The principal utility of Moessbauer Effect spectroscopy in the study of mixed-valence materials is its ability (through measurement of the chemical shift) to distinguish between different oxidation states of the same element in similar chemical environments. By using Moessbauer Effect spectroscopy it is possible to distinguish between trapped and delocalized valence states in mixed-valence compounds. In addition, the rather long lifetime of the Moessbauer experiment, as compared to other forms of spectroscopy, permits evaluation of the rate of intervalence electron exchange in mixed-valence materials. TEMPERATURE COMPENSATED PIEZOELECTRIC OXIDE

MATERIALS Final Report, 23 Feb. 1977 - 30 Nov. 1978
G. R. Barsch and K. E. Spear Sep. 1979 52 p refs
(Contract F19628-77-C-0131; AF Proj. 2305)
(AD-A077650; RADC-TR-79-219) Avail: NTIS
HC A04/MF A01 CSCL 20/2

In order to search for new temperature compensated materials for surface acoustic wave (SAW) devices with low ultrasonic attenuation and high electromechanical coupling, the following investigations were carried out: (1) Crystal growth for lead potassium niobate (PKN), Pb2KNb5O15 and for lithium metasilicate, Li2SiO3 by using the Czochralski method; (2) The complete set of elastic, dielectric and piezoelectric constants and of their temperature coefficients is reported for unpoled PKN; (3) The piezoelectric strain constants d(11) and d(14) of alpha-berlinite have been measured by the static x-ray method. The piezoelectric stress constants e(11) and e(14) calculated from these results are larger than the values previously determined ultrasonically; (4) The dielectric constant and the loss tangent of alpha-berlinite were measured from 1,000 to 1,000,000 Hz between -175 and -200 C. Two relaxation peaks are present in the loss tangent; and (5) In order to assess the reliability of the x-ray method the piezoelectric strain constants d(11) and d(14) of alpha-quartz were measured with this method. The value obtained for d(11) is in excellent agreement with the results obtained by other experimental methods. The value of d(14) obtained from the (024) reflection is about 30 percent larger than the values obtained by other methods. GRA

LOW RESISTIVITY-HIGH MINORITY CARRIER LIFETIME SINGLE CRYSTAL SILICON INVESTIGATION Interim Report, Jul. 1977 - Sep. 1978
Paul M. Stella and R. W. Opjorden Apr. 1979 50 p refs
(Contract F33615-77-C-2045; AF Proj. 2308)
(AD-A077684; AFAPL-TR-79-2031) Avail: NTIS
HC A03/MF A01

The objective of this program is to improve the performance of N+/P silicon solar cells by improving the minority carrier lifetime of moderate to low resistivity silicon material. The behavior of cells fabricated from improved material will be demonstrated by measuring electrical output without irradiation and after 1 Mev electrons and 10 MeV proton irradiation. This report discusses the first fifteen months' efforts toward developing and evaluating a new solar cell silicon material. During this time period, equipment and techniques for material growth have been developed along with analysis of methods for removing impurities from non-ultra pure silicon after wafer fabrication. Five preliminary ultra pure ingots have been grown using boron ion implantation and a single ingot using elemental gallium to provide the P dopant. Results are presented for solar cells made from the ingots. GRA

DIPOLAR DEFECTS IN RARE-EARTH DOPED ALKALINE-EARTH FLUORIDES Final Report, 1978 - 1979
Michael K. Smith 15 May 1979 91 p refs
(AD-A077580; USNA-TSPR-99) Avail: NTIS
HC A05/MF A01 CSCL 20/2

It has become clear that simple point-defect models of relaxations in doped alkaline-earth fluorides are insufficient to explain experimental results. The idea that clusters of rare-earths may be associated with observed relaxations has been suggested. The writer attempted to study calcium fluoride crystals doped with two different rare-earth species, utilizing dielectric relaxation and ionic thermocurrent techniques to investigate the cluster hypothesis. If, in fact, a relaxation is associated with a dipolar cluster, hybrid relaxation involving both rare-earth species present should be observed. The finding (enclosed) provides useful new information concerning the defect structure of rare-earth doped calcium fluoride. GRA

FIELD ELECTRON AND ION SOURCE RESEARCH FOR HIGH DENSITY INFORMATION STORAGE SYSTEM Final Technical Report, Sep. 1977 - Dec. 1978
L. W. Swanson, J. Orloff, and A. E. Bell May 1979 203 p refs
(Contract F33615-76-C-1327; AF Proj. 3164)
(AD-A078520; AFAL-TR-79-1133) Avail: NTIS
HC A10/MF A01 CSCL 20/12

The purpose of this research program is the evaluation and characterization of high brightness field electron and ion sources suitable for use in high density information storage systems. In addition, preliminary evaluation of focussing optics suitable for forming submicron beams of both ions and electrons has been performed. Several new field electron source materials including Mo, LaB6, SmB6 and HfC have been examined. In addition, a complete characterization and comparison between the Zr/W(100) and built-up W(100) emitters operating in the thermal-field (TF) mode is reported. Such source parameters as angular intensity, energy distribution, beam noise spectrum, and source life have been measured. GRA

RESEARCH ON InGaAs FET'S Interim Report
S. Banoy, T. Boyle, R. Fulks, S. Hyder, and C. Nishimoto Sep. 1979 65 p refs
(Contract N00014-78-C-0380; RF54581001; NR Proj. 251-030)
(AD-A078816; TR-1) Avail: NTIS HC A04/MF A01 CSCL 20/12

Virtually the whole effort for this period was spent in trying to grow by Vapor Phase Epitaxy (VPE) dislocation-free InGaAs on GaAs at In percentages above 25%. Of all the techniques tried, significant improvement came only after installation of a H2 bypass on the reactor. Field Effect Transistors (FETs) fabricated on the best of the pre-H2 bypass wafers showed sub-GaAs

values for the effective saturated velocity, and FETs have yet to be fabricated on the wafers grown with the H2 bypass. Efforts at ion-implanting the pre-H2 bypass wafers were not successful, presumably because of the heavy amount of dislocations in the material. GRA

INITIAL VALUE PROBLEMS ON NON-EUCLIDEAN TOPOLOGIES Ph.D. Thesis
Jeffrey Mann Bowen 1979 137 p
Avail: Univ. Microfilms Order No. 8005017

Einstein's equations of general relativity, studied as a Cauchy problem are presented. The equations are split into space-plus-time form, and the dynamical and kinematical variables are distinguished. The initial value equations are specialized to maximal, conformally flat initial spacelike hypersurfaces. Time symmetric solutions of the initial value equations are investigated. When the symmetry conditions are applied to the extrinsic curvature tensor, a simple form for the vacuum solution of the momentum constraint is obtained, representing an object with linear momentum. It is argued that the resulting three-geometry consists of two physically identical, asymptotically flat regions connected by an extremal area throat. Solutions including angular momentum and electric fields are also presented. The solutions found are purely geometric models that may represent moving, (classically) spinning, or electrically charged particles.

SOME RECENT DEVELOPMENTS IN MULTIPLE DECISION THEORY: A BRIEF OVERVIEW
Shanti S. Gupta and Deng-Yuan Huang Oct. 1979 15 p refs (Contract N00014-75-C-0455)
(AD-A077710; Mimeo-Ser-79-26) Avail: NTIS HC A02/MF A01 CSCL 12/1

This paper surveys some recent developments in multiple decision (selection and ranking) theory. The spirit and philosophy underlying this approach to comparing k populations are discussed briefly. Criteria to construct optimal multiple decision procedures, which are based on some 'modifications' of decision theory, are discussed. The combination of the indifference zone and the subset selection approach into a general framework is described. GRA

THE DESIGN AND IMPLEMENTATION OF A RELATIONAL AND NETWORK DATABASE ACCESS LANGUAGE Ph.D. Thesis
Donald Jules Simon 1979 146 p
Avail: Univ. Microfilms Order No. 8002716

A mapping oriented query language is described which can interface with either a relational or network data base. An extended query language utilizes the relational calculus and a CODASYL-type data manipulation language as target languages to map the user's query into the respective data model. The user need not know which relations or records contain which attributes; the user merely provides XQL with (1) the attributes or fields he wants retrieved, and (2) the conditions under which they are to be retrieved. Also, XGL provides the user with functions such as SORT, COUNT, AVERAGE, MIN, and MAX, and provides the users of both relational and network models with a straightforward method of interfacing with either model. Furthermore it allows the users of a network model to view the data in a tubular representation as users of the relational model do.Dissert. Abstr.

QUALITY OF DECISION VERSUS DEPTH OF SEARCH ON GAME TREES Ph.D. Thesis
Dana S. Nau 1979 145 p
Avail: Univ. Microfilms Order No. 8003633

In the field of game playing, good results have been obtained by searching the game tree to some arbitrary depth and heuristically estimating its characteristics beyond that depth. For such a heuristic game tree search, there is a consensus that the quality of the decision improves as the search depth increases, but this agreement is based purely on empirical evidence. A mathematical theory modeling the effects of search depth on the probability of making a correct decision using a heuristic game tree search was developed. This application produced the surprising result that there is an infinite class of game trees for which searching deeper does not increase the probability of making a correct decision, but instead causes the decision to become more and more random. A mathematical proof of this statement is presented along with experimental verification of it, and a discussion of its significance for decision making in general.

DATA DEPENDENCIES IN RELATIONAL DATABASE SCHEMES Ph.D. Thesis
Alberto Oscar Mendelzon 1979 78 p
Avail: Univ. Microfilms Order No. 8003792

The tableau method for representing and manipulating database schemes is used for developing an algorithm to determine whether a given join dependency is a logical consequences of a set of functional, multivalued and join dependencies. A notion of equivalence of database schemes is introduced, based on the equality of the fixed-point sets of the associated project-join mappings. It is shown that the implication testing method can be applied to the determination of whether two database schemes are equivalent under a set of functional and join dependencies. Finally, the notion of lossless decompositions and fixed-points of a database scheme is examined by introducing generalized mutual dependencies. It is shown that generalized mutual dependencies are equivalent to a special type of join dependencies, and furthermore, any join dependency is equivalent to a generalized mutual dependency plus a set of multivalued dependencies. Dissert. Abstr.

ON DATABASE MANAGEMENT SYSTEM ARCHITECTURE Interim Report
Michael Hammer and Dennis McLeod Oct. 1979 43 p refs
Prepared in cooperation with the Univ. of Southern California, Los Angeles
(Contract N00014-76-C-0944)
(AD-A076417; MIT/LCS/TM-141) Avail: NTIS HC A03/MF A01 CSCL 05/2

Despite the many advances that have been made in the field of database management in the last two decades, in many respects the paradigm of database management has not changed much since its inception. Several long-standing assumptions pervade the field and exert a great influence on the architecture of database management systems, their functions, and the kinds of databases that they manage. This paper reconsiders some of these assumptions and suggests certain alternatives to them. In particular, it is argued that the concept of an integrated database ought to be supplanted by that of a federated database, a loose assembly of semi-independent components; the position of the database management system in the context of a total information system is reexamined, and arguments are made for extending its functional capabilities; and controlled logical redundancy in the schema is introduced as a means of improving the usability of a database and of enhancing its life-cycle performance. STUDY OF ADVANCED ELECTRIC PROPULSION SYSTEM CONCEPT USING A FLYWHEEL FOR ELECTRIC VEHICLES Final Report
Francis C. Younger and Heinz Lackner Dec. 1979 231 p refs
(Contracts DEN3-78; EC-77-A-31-1011)
(NASA-CR-159650; DOE/NASA/0078-79/1;
WMB/A-4500-131-3-R1) Avail: NTIS HC A11/MF A01 CSCL 10B

Advanced electric propulsion system concepts with flywheels for electric vehicles are evaluated and it is predicted that advanced systems can provide considerable performance improvement over existing electric propulsion systems with little or no cost penalty. Using components specifically designed for an integrated electric propulsion system avoids the compromises that frequently lead to a loss of efficiency and to inefficient utilization of space and weight. A propulsion system using a flywheel power energy storage device can provide excellent acceleration under adverse conditions of battery degradation due either to very low temperatures or high degrees of discharge. Both electrical and mechanical means of transfer of energy to and from the flywheel appear attractive; however, development work is required to establish the safe limits of speed and energy storage for advanced flywheel designs and to achieve the optimum efficiency of energy transfer. Brushless traction motor designs using either electronic commutation schemes or dc-to-ac inverters appear to provide a practical approach to a mass producible motor, with excellent efficiency and light weight. No comparisons were made with advanced system concepts which do not incorporate a flywheel. M.G.

BALLOON-BORNE OBSERVATIONS OF NGC 4511 USING THE MISO TELESCOPE
F. Perotti, A. DellaVentura, G. Sechi, G. Villa, G. DiCocco (CNR, Bologna), R. E. Baker, R. C. Butler, A. J. Dean, S. J. Martin, and D. Ramsden Sep. 1979 5 p refs Sponsored jointly by UK Sci. Res. Council and CNR Prepared in cooperation with CNR
Avail: NTIS HC A02/MF A01

The Seyfert Galaxy NGC 4151 was observed from balloon altitudes using the MISO low energy gamma-ray telescope on May 23, 1977. The spectrum was measured over the range 0.04 to 20 MeV and a change in the spectral index was observed at about 2 MeV. The data at low energies are in good agreement with other hard X-ray data, but at higher energies the data are consistent with an exponential spectrum having an e-folding energy of 2.1 MeV. CURRENT APPLICATIONS OF SCHMIDT TELESCOPES IN ASTRONOMY
H. J. Wendker, ed. 30 Mar. 1979 50 p refs Partly in GERMAN and ENGLISH
(ISSN-0374-1583) Avail: NTIS HC A03/MF A01

Various programs throughout the world including the use of Schmidt telescopes are reviewed. In each case the telescope is described and its applications are outlined. Programs include spectroscopic surveys, the gathering of classification criteria for late-type stars, the compilation of spectral atlases, photometric studies, measuring light curves of T Tauri stars, and radial velocity determinations with objective prism spectra as well as spectrophotometry with crossed grating and prism. Also reported are studies of minor planets, galactic structure, and extragalactic work. Operating parameters for this instrument, such as polar alignment, wind sensitivity, collimation, and guiding are also covered. Author (ESA)

SYNTHETIC STELLAR SPECTRA: A LIBRARY OF CALCULATION PROGRAMS [SPECTRES STELLAIRES SYNTHETIQUES: PROGRAMMES DE CALCUL]
Yves Chmielewski 1979 123 p refs In FRENCH; ENGLISH summary
(Publ-Ser-B-Fasc-7) Avail: NTIS HC A06/MF A01

Programs used to compute solar or stellar spectra by quantitative analysis assuming local thermodynamic equilibrium are described. This set of programs allows for the rapid computation of single as well as blended lines. Routines used to prepare stellar models and to compute the state of a stellar atmosphere are also described. GALACTIC KINEMATICS OF MOLECULAR CLOUDS Ph.D. Thesis
Anthony Albert Stark 1979 95 p
Avail: Univ. Microfilms Order No. 8003795

The kinematics of molecular clouds in the galactic disk are studied to determine the magnitude of cloud to cloud velocity dispersions and systematic streaming motions. Three observational programs are reported: (1) a strip map of l = 180 deg from b = -9 deg to +8 deg (2) a 20 point map of the minor axis of M31; and, (3) three maps in the molecular ring, centered at 34 deg, l = 36 deg and l = 51 deg. Dissert. Abstr.

N80-19004 Nebraska Univ. - Lincoln.
AN ASTROPHYSICAL INVESTIGATION OF RADIUS AND MASS ANOMALIES AMONG SHORT PERIOD CEPHEIDS Ph.D. Thesis
Gordon David Niva 1979 118 p
Avail: Univ. Microfilms Order No. 8005300

Simultaneous photometric and spectroscopic observations were obtained for the short period Cepheids, SU Cas and TU Cas. Using these observations and a modified Wesselink method, in which the radius is obtained from a relation between the (V-R) color and the surface brightness, the radii of the stars were calculated and compared. The pulsation mode of SU Cas was tested by its position in the period radius diagram. The radius obtained gives weak support to the hypothesis that SU Cas is a first overtone pulsator. The spectroscopic radial velocities of TU Cas were combined with those of other authors and a least squares Fourier fitting technique was applied. The periods (previously obtained only from Fourier analysis of light curves) were confirmed and the time rate of change of the amplitudes of various modes was determined. Dissert. Abstr.

N80-19005 Princeton Univ., N. J.
HYDRODYNAMIC CALCULATIONS OF INTERSTELLAR CLOUD COLLISIONS Ph.D. Thesis
Mark Alan Hausman 1979 94 p
Avail: Univ. Microfilms Order No. 8003781

An algorithm for computing hydrodynamics in three dimensions treats a gas as if it were divided into a number of discrete mass-elements, each of which feels gravitational and viscous forces as well as a short-range force which simulates the effects of pressure gradients. The algorithm was used to examine the gross properties of collisions of interstellar HI clouds. A number of simulations with varying cloud mass ratios, relative velocities, and impact parameter are described. Results are examined. Dissert. Abstr.

N80-19006 California Univ., Santa Barbara.
THEORETICAL MODELS OF STELLAR FORMATION Ph.D. Thesis
Alan Paul Boss 1979 404 p

Avail: Univ. Microfilms Order No. 8003031

Theoretical models of the collapse and fragmentation of rotating interstellar clouds into single or multiple protostellar systems were constructed. A series of gravitational hydrodynamic computer codes were constructed in order to numerically follow the collapse of spherically symmetric (1 D), axially symmetric (2 D), and nonaxially symmetric (3 D) interstellar clouds. The Poisson equation for the gravitational potential is solved using a spherical harmonic expansion. The 1 D code was used to study the dynamic collapse of pressureless, isothermal, and adiabatic clouds as well as the equilibrium of an isothermal Bonnor-Ebert sphere. The 1 D code with its radiative transfer inclusion calculated the nonhomologous collapse of an initially isothermal cloud into the nonisothermal regime where rising temperature temporarily halts the collapse. The 2 D and 3 D codes were constructed so as to conserve angular momentum both locally and globally. With the 2 D code a rotating interstellar cloud collapses to form a rotating, near equilibrium ring. Numerical tests with the 2 D code as well as a completely analytic treatment of the collapse of a rotating, pressureless cloud confirm the reality of ring formation in axially symmetric clouds. The 3 D code was used to follow the collapse of rotating clouds subjected to various nonaxially symmetric perturbations. Dissert. Abstr.

N80-19007 Hawaii Univ., Honolulu.
THE FORMATION OF LATE O AND B STARS WITHIN DENSE MOLECULAR CLOUDS Ph.D. Thesis
Charles Arnold Beichman 1979 148 p.
Avail: Univ. Microfilms Order No. 8003277

The dense, hot cores of 24 molecular clouds were examined at infrared wavelengths between 2.2 and 25 micron m in search of embedded, luminous objects thought to be massive O and B stars at an early stage of their evolution. Nineteen of the clouds were examined at 20 micron m for high sensitivity to sources of low color temperature between 80 and 200 K. The 20 micron m searches revealed four objects too red to be discovered in previous searches at 2.2 and 10 micron m. Results indicate that infrared sources in molecular clouds tend to form in clusters whose characteristic size is very similar to that found in trapezium-like groups of O and B stars. It seems likely that molecular clouds fragment as their densities reach 10 to the 4th power/cu cm into independently collapsing nuclei separated by about 0.1 pc and each capable of producing one (or more) star(s). Some embedded infrared sources are surrounded by a small amount of ionized material. Dissert. Abstr.

N80-19008 Florida Univ., Gainesville.
EVOLUTION OF PRE-MAIN-SEQUENCE BINARY STAR SYSTEMS Ph.D. Thesis
Jon Kenneth West 1979 221 p.
Avail: Univ. Microfilms Order No. 8002914

A quasistatic polytropic model representing the pre-main-sequence contraction phase was applied to both components of close binary star systems. Models were calculated for eleven observed semi-detached close binaries published in the literature and the results were compared with the observed systems. The names and ages of the three that are likely to be pre-main-sequence are: U Caphei (610,000 years), X Trianguli (4.6 million years), and W Ursae Minoris (1.87 million years). The following four systems were found not to fit the pre-main-sequence model in this investigation: TV Cassiopeia, AI Draconis, Beta Persei, and TX Ursae Majoris. The following four systems could be pre-main-sequence with modifications to the model: Im Aurigae (350,000 years), delta Librae (820,000 years), U Sagittae (378,000 years), and V505 Sagittarii (1.89 million years). Dissert. Abstr.

INFLUENCE OF THE B SUB x COMPONENT OF THE INTERPLANETARY MAGNETIC FIELD ON MAGNETOPAUSE RECONNECTION
W. D. Gonzales and A. L. C. Gonzales Dec. 1979 12 p. refs
Revised. Submitted for publication
(INPE-1645-RPE/101-Rev) Avail: NTIS HC A02/MF A01

The first clear evidence of an effect of the B sub x component of the interplanetary magnetic field (IMF) in magnetopause reconnection was obtained from polar ionospheric electric fields measured with balloons. This B sub x effect results in a north-south asymmetry in magnetopause reconnection, which favors one hemisphere over the other (according to the sign of B sub x) and displaces the main reconnection region from the nose to higher latitudes (according to the magnitude of B sub x). Thus, the reconnection line becomes shorter when B sub x is large enough, resulting in a smaller potential of reconnection. Author

THE DEVELOPMENT OF COMPUTER PROGRAMS TO DETERMINE ATMOSPHERIC WINDS FROM ENTRY PROBE DATA AND POSSIBLE APPLICATIONS TO THE PIONEER VENUS MISSION Ph.D. Thesis
Trevor Charles Sorensen 1979 483 p.
Avail: Univ. Microfilms Order No. 8002809

Equations able to analytically determine atmospheric winds from probe entry data were derived and subsequently incorporated into a computer program to facilitate the processing and analysis of such data. The wind extraction equations used in this program depend only on an accurate determination of the actual trajectory parameters. Programs were developed to produce simulated differential long baseline interferometry and trajectory reconstruction data in order to test the applicability of the wind extraction program for analyzing the actual Pioneer Venus Mission probes entry data. From these simulated data test cases, it was concluded that the wind extraction program is able to extract the mean wind profiles from actual probe entry data of the Pioneer Venus Mission below an altitude of at least 50-60km, and if the data are of good enough quality, possibly up to about 100km altitude. Dissert. Abstr.

CONVECTION IN ROTATING LAYERS WITH THERMAL WINDS AND APPLICATION TO JUPITER Ph.D. Thesis
David Henry Hathaway 1979 150 p.
Avail: Univ. Microfilms Order No. 8002980

A linear stability analysis is carried out for fluid layers under uniform rotation which possess both vertical and horizontal temperature gradients. In order to represent various latitudes with these plane parallel layers, a rotation vector is used which is generally oblique to gravity. The configuration is used to assess the preferred convective modes as a function of latitude. Two major effects arise: (1) the tilted rotation vector introduces a preference for roll like disturbances with north-south orientations, the preference is particularly strong in the equatorial regions, and, (2) the presence of a north-south temperature gradient produces a thermal wind shear which favors axisymmetric convective rolls oriented parallel to the flow in an east-west direction. The axisymmetric cloud bands observed on the planet Jupiter is suggested to be produced by the east-west convective instabilities. A simple radiative-convective model for Jupiter is used to estimate the parameter values relevant in the stability analysis. Dissert. Abstr.

SATURN'S MAGNETOSPHERE, RINGS, AND INNER SATELLITES Progress Report
J. A. VanAllen, M. F. Thomsen, B. A. Randall, R. L. Rairden, and C. L. Grosskreutz. Nov. 1979. 30 p. refs.
(Contract N00014-76-C-0016)
(AD-A076619; Rept-79-44) Avail: NTIS HC A03/MF A01 CSCL 03/1

The 31 August - 5 September 1979 observations together with those of the other Pioneer 11 investigators provide the first thoroughly credible discovery of the magnetosphere of Saturn and many detailed characteristics thereof. In physical dimensions and energetic charged particle population, Saturn's magnetosphere is intermediate between those of Earth and Jupiter. In terms of planetary radii, the scale of Saturn's magnetosphere more nearly resembles that of Earth and there is much less inflation by entrapped plasma than in the case of Jupiter. The orbit of Titan lies in the outer fringes of the magnetosphere. Particle angular distributions on the inbound leg of the trajectory (sunward side) have a complex pattern but are everywhere consistent with a dipolar magnetic field approximately perpendicular to the planet's equator. On the outbound leg (dawn side) there are marked departures from this situation outside of B r sub S, suggesting an equatorial current sheet having both longitudinal and radial components. The particulate rings and inner satellites have a profound effect on the distribution of energetic particles. GRA

RECENT DATA ON PLANETS IN THE SOLAR SYSTEM [NEUE ERKENNTNISSE UEBER UNSERE PLANETEN]
Helmut Rucker. Sep. 1977. 44 p. refs. In GERMAN. Presented at Austrian Physikalischen es., Leoben, West Germany, 30 Sep. 1977.
Avail: NTIS HC A03/MF A01

Data collected by the Mariner, Venera, Viking and Pioneer spacecraft are reviewed. The composition and characteristics of the atmosphere, measurements of the magnetic fields and surface morphology of the planets Mercury, Venus, Mars, and Jupiter are discussed. The biological experiments carried out by the Viking missions are detailed, concluding that no positive evidence of life on Mars was found. Author (ESA)

A NUMERICAL SIMULATION OF CHARGED PARTICLE INTERACTIONS WITH INTERPLANETARY SHOCK WAVES Ph.D. Thesis
Robert Blair Decker. 1979. 235 p.
Avail: Univ. Microfilms Order No. 8002750

A computer model, developed to numerically simulate the combined effects of a charged particle's energization at an interplanetary shock and propagation to a satellite-borne particle detector at the obsevation point, is described and the trajectory results examined. A charged particle's adiabatic motion is assumed to be scatter-free along the laminar spiral interplanetary magnetic field (IMF). The interplanetary shock wave is taken as a sun-centered sperical surface that expands radially outward. The plasma and field changes across the shock obey the jump conditions for a fast mode magnetohydrodynamic (MHD) shock wave. For a chosen shock model, a particle of specified observed kinetic energy and pitch angle at a given observation time and fixed observation point is followed numerically backward in time through the IMF and shock wave. The shock interaction is treated by solving the particle's exact orbit equations through the locally planar MHD shock discontinuity. Dissert. Abstr.

SUNSPOT VECTOR MAGNETIC FIELDS AND MODEL UMBRAL ATMOSPHERES Ph.D. Thesis
Joseph Bearak Gurman. 1979. 205 p.
Avail: Univ. Microfilms Order No. 8002978

The Stokes parameters provide a complete description of the polarization of electromagnetic radiation. The Stokes polarimeter of the High Altitude Observatory, which is capable of measuring all four Stokes parameters simulataneously across a spectral line profile, was used to observe a round, unipolar sunspot in three absorption lines and the nearby continua. Observations in the weak Zeeman triple lambda 6302.50 A are used to derive the vector magnetic field B across the spot. Doppler shift measurements in the Zeeman-insensitive line Fe I lambda 5576.10 A show no significant vertical flows in the spot. Finally, Stokes profiles of the Zeeman-sensitive resonance line Na I D2 lambda 5889.96 A are used to probe the depth variation of the magnetic field and to obtain a model atmosphere for the umbra. Combination of the weak- and strong-line results indicates a horizontal variation in the sum of gas and magnetic pressure in the umbra. Acoustic turbulence is proposed to prevent the creation of flows which are not observed. Possible scales of such turbulence are discussed. Dissert. Abstr.

LA POSTA SOLAR RADIO MAPS Technical Document, May - Sep. 1979
P. E. Argo and F. L. Wefer. Sep. 1979. 62 p.
(Contract N00123-78-C-0043)
(AD-A076376; NOSC-TD-283) Avail: NTIS HC A04/MF A01 CSCL 03/1

The La Posta 18.3 m antenna has been used since 1972 to acquire radio maps of the solar disk at wavelengths of 0.86 and 2.0 cm. The NOSC in-house research program is supporting the continuation of this program through the peak of the present solar activity cycle (about 1981). During this period of operation, daily (5 days per week) radio maps at both wavelengths will be acquired. This report presents the radioheliogram data for the second quarter of 1979. GRA

This monthly publication presents brief articles concerning recent developments in European scientific research. It is hoped that these articles (which do not constitute part of the scientific literature) may prove of value to American scientists by calling attention to current developments and to institutions and individuals engaged in these scientific efforts. The articles are written primarily by members of the staff of ONRL. Topics in this issue include: La Renaissance du Dirigeable - A solution in search of a problem; Chemistry at Swiss Universities; Formal Design Methodology - How to design computer systems without really using your head; UK Battery Research--Air Force; Solar Energy in Greece and Egypt; Fluid Dynamics at the Technische Hogeschool Delft; The Institut fuer Hydromechanik at the University of Karlsruhe; Materials Research at Leicester, Loughborough, and Leeds; High Strength Low Alloy Steels; Preoperative Hypothermic Renal Perfusion--Another use for the arterial catheter; and Semiconductor Injection Lasers. [RESEARCH AND PEDAGOGY IN NOISE AND VIBRATION CONTROL] Annual Report, 1979
Mar. 1979 43 p refs
Avail: NTIS HC A03/MF A01

Research and activities for the period 1978/79 are reported. Fields covered include fluid dynamics and acoustics, automotive engineering, operational acoustics and audiology as well as structural dynamics. Work in data analysis, electronic research and development, industrial noise research and development, and in noise and vibration control is also summarized. Pedagogical activities for the year are outlined. Author (ESA)

SUBJECT INDEX

SCIENTIFIC AND TECHNICAL AEROSPACE REPORTS VOLUME 18 NUMBER 9

Typical Subject Index Listing

The subject heading is the key to the subject content of the document. Titles, report numbers, and accession numbers of pertinent documents are provided under each subject heading. When the title is insufficiently descriptive of the document content, a title extension has been added, separated from the title by three hyphens. The report number helps to indicate the type of document cited (e.g., NASA report, NASA translation, NASA contractor report). The NASA accession number is the number by which the document abstracts are arranged in this journal and by which the document is sold or requested. The titles, with title extensions if present, are arranged under each subject heading in ascending accession number order. The subject headings have been selected from the latest revision of the *NASA Thesaurus* (NASA SP-7050).

ADAPTIVE CONTROL
The reduced order model problem in distributed parameter systems adaptive identification and control
[NASA-CR-162807] N80-18768
Some properties of the dual adaptive stochastic control algorithm
[AD-A078488] N80-18779
Numerical methods and approximation and modelling problems in stochastic control theory
[AD-A078288] N80-18789

ADAPTIVE FILTERS
A projected stochastic approximation method for adaptive filters and identifiers
[AD-A078602] N80-18812

ADHESION
Comparison of the weight loss and adherence of nine different polyimide films thermally aged at 315 C and 350 C in air --- high temperature lubricants
[NASA-TM-81381] N80-18183
Applications of surface analysis techniques to studies of adhesion
[AD-A077520] N80-18198

ADHESION TESTS
Environmental durability testing of structural adhesives. Part 3: Reliabond 500/Reliabond 398
[AD-A078953] N80-18196

ADHESIVE BONDING
Effect of Surface Exposure Time (SET) on strength of adhesive bonds to aluminum
[AD-A077107] N80-18195
Applications of surface analysis techniques to studies of adhesion
[AD-A077520] N80-18198
Environmental durability of the Weldbond, FPL and PABST joining systems
[AD-A076608] N80-18199

ADHESIVES
Environmental durability testing of structural adhesives. Part 3: Reliabond 500/Reliabond 398
[AD-A078953] N80-18196
Adhesives: Properties, preparation, and applications, volume 2. A bibliography with abstracts
[PB80-801855] N80-18201

ADSORPTION
H20-N2 transition rates and line shifts of water vapor
[AD-A078394] N80-18622

AERIAL PHOTOGRAPHY
Significant results from a project on agricultural statistics, 1975 - 1978
[INPE-1609-NTE/155] N80-18532
An evaluation of conventional correlation methods when matching infrared imagery to panchromatic imagery
[AD-A076111] N80-18537
Proceedings of the Image Understanding Workshop
[AD-A077568] N80-18539

AERIAL RECONNAISSANCE
User definition and mission requirements for unmanned airborne platforms, revised
[NASA-CR-156861] N80-17981
Mission and sensor concepts for coastal and ocean monitoring using spacecraft and aircraft
[NASA-TM-80103] N80-18672

AEROACOUSTICS
Publications in acoustic and noise control from NASA Langley Research Center during 1940-1979 --- bibliographies
[NASA-TM-80211] N80-18884

AERODYNAMIC CHARACTERISTICS
An experimental investigation of two large annular diffusers with swirling and distorted inflow
[NASA-TP-1628] N80-17984
Wind-tunnel/flight correlation study of aerodynamic characteristics of a large flexible supersonic cruise airplane (XB-70-1). 3: A comparison between characteristics predicted from wind-tunnel measurements and those measured in flight
[NASA-TP-1516] N80-17986

SUBJECT

AERODYNAMIC COEFFICIENTS
Comparison of aerodynamic coefficients obtained from theoretical calculations wind tunnel tests and flight tests data reduction for the alpha jet aircraft
[NASA-TM-75237] N80-17991
Remarks on the calculation of the kernel approximation in unsteady aerodynamics
[AAAF-NT-79-07] N80-18842

AERODYNAMIC FORCES
Calculation of subsonic normal force and centre of pressure position of bodies of revolution using slender body theory boundary layer method
[AD-A076128] N80-17999
Theoretical analysis of the flow field over a family of Ogive bodies, volume 2
[AD-A077397] N80-18000
An investigation of F-16 nozzle-afterbody forces at transonic Mach numbers with emphasis on support system interference
[AD-A078693] N80-18046

AERODYNAMIC HEATING
Effect of precursor heating on radiating and chemically reacting viscous flow around a Jovian entry body N80-18329
Thermal barrier seal
[NASA-CASE-MSC-18390-1] N80-18398

AERODYNAMIC STALLING
Dynamic stall on oscillating airfoils in oscillating free-streams N80-17983
Transient effects on a stalled airfoil in a pulsating flow: Comparison with results from a similar airfoil undergoing horizontal shaking --- during wind tunnel tests
[AAAF-NT-79-13] N80-18003
Rotors in forward flight and dynamic stall
[AAAF-NT-79-20] N80-18050

AERODYNAMICS
Solution of a few nonlinear problems in aerodynamics by the finite elements and functional least squares methods --- mathematical models of transonic flow using nonlinear equations
[NASA-TM-75732] N80-17990

AEROELASTICITY
Aeroelastic equations of motion of a Darrieus vertical-axis wind-turbine blade
[NASA-TM-79295] N80-18446

AERONOMY
Satellite atmospheric radiance measurements in the vacuum ultraviolet
[AD-A078628] N80-18620

AEROSOLS
An accurate model for sample droplet acceleration in analytical flames
[AD-A078655] N80-18131
Ensemble trajectory analysis of summertime sulfate aerosol concentrations in the northeastern United States N80-18584
The effects of relative humidity on atmospheric aerosol extinction in the 3-5 micrometers and 8-15 micrometers spectral regions
[AD-A070159] N80-18610
Lidar observations at 0.7-micrometers and 10.6-micrometers wavelengths during dusty infrared test 1 (dirt-1)
[AD-A075275] N80-18924

AEROSPACE ENVIRONMENTS
Phase change/heat storage materials data compilation
[AD-A076414] N80-18096
Space radiation effects on Teflon films
[AD-A076613] N80-18194
Predictions of the Space Environment Services Center N80-18489
Geophysical forecasting at AFGWC --- aerospace environments N80-18490
Experimental results on plasma interactions with large surfaces at high voltages
[NASA-TM-81423] N80-18946

AEROSPACE MEDICINE
Objective measurement of human tolerance to +G sub z acceleration stress
[NASA-TM-81166] N80-18709
A new anti-G value for high-performance aircraft
[AD-A076904] N80-18719
The cosmos today and tomorrow
[NASA-TM-75736] N80-19010

AEROSPACE TECHNOLOGY TRANSFER
The world of tomorrow: Aerospace activities for 8- to 10-year olds. A guide for leaders of children's groups and teachers of the lower grades
[NASA-EP-144] N80-18074
Forest resource information system --- Baker County, Florida and Picayune, Mississippi sites; St. Regis Paper Company
[E80-10065] N80-18515

AFTERBODIES
Numerical solution of a supersonic nozzle afterbody flow with jet exhaust
[AD-A076116] N80-17998
An investigation of F-16 nozzle-afterbody forces at transonic Mach numbers with emphasis on support system interference
[AD-A078693] N80-18046

AFTERBURNING
Contribution of surface catalysis and gas phase reaction to catalytic combustor performance
[AD-A078465] N80-18134

AGRICULTURAL AIRCRAFT
Full scale visualization of the wing tip vortices generated by a typical agricultural aircraft
[NASA-CR-162796] N80-17992
Aerial applications dispersal systems control requirements study --- agriculture
[NASA-CR-159781] N80-18586

AGRICULTURE
Development of LANDSAT-based technology for crop inventories
[E80-10054] N80-18506
Devleopment of LANDSAT-based technology for crop inventories: Appendices
[E80-10055] N80-18507
LACIE evaluation and outlook panel transcript: The LACIE Symposium
[E80-10069] N80-18518
AgRISTARS. A joint program for agriculture and resources inventory surveys through aerospace remote sensing. Development and evaluation of clustering procedures --- large area crop inventories
[E80-10079] N80-18526
The easy remote sensing problem
[REPT-20] N80-18528
The Cramer-Rao lower bound as a criteria for evaluating a large data reduction system such as LACIE
[REPT-21] N80-18529
Application of statistical correlation in the study of available water in layers of Cerrado soil
[INPE-1607-TDL/014] N80-18531
Significant results from a project on agricultural statistics, 1975 - 1978
[INPE-1609-NTE/155] N80-18532

AGROMETEOROLOGY
LACIE evaluation and outlook panel transcript: The LACIE Symposium
[E80-10069] N80-18518

AILERONS
Advanced composite aileron for L-1011 transport aircraft
[NASA-CR-162863] N80-18103

AIR
A semi-empirical equation for the viscosity of air
[AD-A072053] N80-18342
The NRL CHMAIR code: A disturbed sea level air chemistry code
[AD-A077667] N80-18612

AIR BAG RESTRAINT DEVICES
Feasibility testing of a Body Inflatable Bladder (BIB) restraint device
[AD-A078681] N80-18013

AIR BREATHING ENGINES
Fiber optic sensors for measuring angular position and rotational speed --- air breathing engines
[NASA-TM-81454] N80-18368

AIR CUSHION LANDING SYSTEMS
New remotely piloted vehicle launch and recovery concepts: Computer program listings
[AD-A076611] N80-18035

AIR DEFENSE
Kinetic model for a purpose carrying target finding air defense missile (KINM)
[FOA-C-20315-E3] N80-18083

AIR FLOW
An experimental and theoretical study of the confined vortex with high flow rate N80-18332

AIR INTAKES
Unsteady flow measurements in air intakes
[AAAF-NT-79-16] N80-18005
On the pulsation of a normal shock wave contained in an aerodynamic inlet
[AAAF-NT-79-17] N80-18006

AIR NAVIGATION
A new approach to multi-sensor navigation system design --- for air and digital navigation N80-18015
A navigation algorithm for single channel low-cost GPS receiver N80-18016
Differential Omega in the Alaska/Yukon region: An analytic assessment
[AD-A078517] N80-18018
Automated air information production system, phase 1. Volume 4: Charting subsystem
[AD-A076107] N80-18728
Automated air information production system, phase 1. Volume 5: Cartographic EBR system
[AD-A076108] N80-18729
Automated air information production system, phase 1. Volume 1: Executive summary
[AD-A076104] N80-18730
Automated air information production system, phase 1. Volume 2: Publishing subsystem
[AD-A076105] N80-18731
Automated air information production system, phase 1. Volume 3: Air facilities subsystem
[AD-A076106] N80-18732

AIR PIRACY
Task force on deterrence of air piracy
[AD-A076457] N80-18009

AIR POLLUTION
High solids coating systems --- air pollution
[AD-A076433] N80-18193
Ensemble trajectory analysis of summertime sulfate aerosol concentrations in the northeastern United States N80-18584
On the future average mercury content of air, soil and river sediments in the European Economic Community and in the world's oceans
[EUR-6023] N80-18585
Air pollution effects on materials. Citations from the American Petroleum Institute data base
[PB80-801871] N80-18588
Air pollution effects on materials. Citations from the NTIS data base
[PB80-801863] N80-18589

AIR TO AIR MISSILES
The vibration response of the PHOENIX missile in the F-14 aircraft captive-flight environment N80-18227

AIR TRAFFIC CONTROL
Report on the task force on aircraft separation assurance, appendices --- systems analysis of collision avoidance systems integration in the air traffic control airspace utilization system
[AD-A077713] N80-18017
Early flight test experience with Cockpit Displayed Traffic Information (CDTI)
[NASA-TM-80221] N80-18037
The effect of viewing time, time to encounter, and practice on perception of aircraft separation on a cockpit display of traffic information
[NASA-TM-81173] N80-18038

AIR TRANSPORTATION
The aerial relay system: An energy-efficient solution to the airport congestion problem
[NASA-TM-80208] N80-16011

AIRBORNE EQUIPMENT
Angular vibration measurement techniques --- airborne electro-optical package disturbances N80-18222

AIRCRAFT ACCIDENT INVESTIGATION
Human factors in high speed low level accidents: A 15 year review
[AD-A076221] N80-18012
Aviation safety and its improvement
[VTH-LR-260] N80-18014

AIRCRAFT ANTENNAS
Comparison of measured data with IF-77 propagation model predictions
[AD-A076508] N80-18259

AIRCRAFT CONSTRUCTION MATERIALS
The potential for damage from the accidental release of conductive carbon fibers from burning composites
[NASA-TM-80213] N80-18108
Advanced aluminum alloys from rapidly solidified powers
[AD-A077197] N80-18161

Development of advanced aluminum alloys from rapidly solidified powders for aerospace structural applications
[AD-A077800] N80-18162
Endurance and failure characteristics of modified Vasco X-2, CBS 600 and AISI 9310 spur gears --- aircraft construction materials
[NASA-TM-81421] N80-18405
A review of Australian investigations on aeronautical fatigue during the period April 1977 to March 1979 --- structural strain and fatigue life studies on aircraft structures and construction materials
[AD-A071641] N80-18449

AIRCRAFT DESIGN
The aerial relay system: An energy-efficient solution to the airport congestion problem
[NASA-TM-80208] N80-18011

AIRCRAFT ENGINES
Aeropropulsion in year 2000
[NASA-TM-81416] N80-18043

AIRCRAFT EQUIPMENT
Air speed and attitude probe
[NASA-CASE-FRC-11009-1] N80-18036
Specification for the installation of electrical resistance strain gauges on strain pairs counter aircraft --- to monitor fatigue damage
[AD-A071363] N80-18369

AIRCRAFT FUELS
Initial characterization of an Experimental Referee Broadened-Specification (ERBS) aviation turbine fuel
[NASA-TM-81440] N80-18205

AIRCRAFT INSTRUMENTS
Aircraft program for target background, and sky radiance measurements
[AD-A076959] N80-18624

AIRCRAFT MAINTENANCE
Aircraft transparency failure and logistical cost analysis: Supplemental study
[AD-A075500] N80-18033
Proceedings of the 7th Ann. Tri-Service Meeting for Aircraft Engine Monitoring and Diagnostics --- conferences
[AD-A076126] N80-18045

AIRCRAFT PILOTS
Pilot selection using psychological methods
[FOA-C-55024-H7] N80-18716

AIRCRAFT RELIABILITY
Aviation safety and its improvement
[VTH-LR-260] N80-18014

AIRCRAFT SAFETY
Task force on deterrence of air piracy
[AD-A076457] N80-18009
NASA aviation safety reporting system
[NASA-TM-78606] N80-18010
Aviation safety and its improvement
[VTH-LR-260] N80-18014

AIRCRAFT SPIN
Thrust augmented spin recovery device
[NASA-CASE-LAR-11970-2] N80-18048

AIRCRAFT STRUCTURES
Composite components on commerical aircraft
[NASA-TM-80231] N80-18109
Angular vibration measurement techniques --- airborne electro-optical package disturbances
N80-18222
A review of Australian investigations on aeronautical fatigue during the period April 1977 to March 1979 --- structural strain and fatigue life studies on aircraft structures and construction materials
[AD-A071641] N80-18449

AIRCRAFT SURVIVABILITY
General aviation airplane structural crashworthiness programmer's manual
[AD-A075737] N80-18008

AIRCRAFT TIRES
Improved tire/wheel concept --- pneumatic aircraft tire
[NASA-CASE-LAR-11695-2] N80-18402

AIRFOIL PROFILES
Identification of noise sources in FC centrifugal fan rotors N80-18395

AIRFOILS
The aerodynamic design of an advanced rotor airfoil
[NASA-CR-2961] N80-17989
Transient effects on a stalled airfoil in a pulsating flow: Comparison with results from a similar airfoil undergoing horizontal shaking --- during wind tunnel tests
[AAAF-NT-79-13] N80-18003
Investigation of the boundary layer behavior on turbine airfoils
[AD-A075501] N80-18044

AIRGLOW
Airglow studies on the ionosphere dynamics over low latitude in Brazil
[INPE-1644-RPE/100-REV] N80-18600

AIRLINE OPERATIONS
A consideration of general aviation in the United Kingdom
[TT-7902] N80-17982

AIRPORT TOWERS
Development and test of low-impact resistant towers
[AD-A077160] N80-18052

AIRPORTS
Nondestructive evaluation of airport pavements. Volume 1: Program references
[AD-A078835] N80-18051

AIRSHIPS
European scientific notes, volume 33, no.7 --- airships, electric batteries, oceanography and fluid dynamics
[AD-A075097] N80-19019

AIRSPEED
Air speed and attitude probe
[NASA-CASE-FRC-11009-1] N80-18036

ALASKA
Crystal alignments in the fast ice of arctic Alaska
[AD-A077188] N80-18541

ALBEDO
A study of the influence of orography and differential albedo on the atmospheric circulation: An application to the Brazilian Northeast
[INPE-1640-TDL/015] N80-18603

ALCOHOLS
Experimental alcohol fuel plants
[ATF-P-5000-2] N80-18203
Alcohol fuels information directory
[ATF-P-5000-3] N80-18204

ALGAE
Tests of laser induced fluorescence from algae at sea
[FOA-C-30171-E1] N80-18678

ALGEBRA
The class number of an algebraic number field: its interpretation and use N80-18797
Some optimal and near-optimal low rate algebraic convolution codes N80-18803
Calculating constraints on relational expressions
[AD-A077092] N80-18829
COMMUTE: A computer code for noncommutative algebra --- for study of triatomic molecules in the atmosphere
[AD-A077360] N80-18905

ALGORITHMS
A navigation algorithm for single channel low-cost GPS receiver N80-18016
Concepts for generating optimum vertical flight profiles
[NASA-CR-159181] N80-18031
Viterbi decoding modified for sources with memory N80-18073
AgRISTARS: A joint program for agriculture and resources inventory surveys through aerospace remote sensing. Development and evaluation of clustering procedures --- large area crop inventories
[E80-10079] N80-18526
Linear and almost-linear methods for the unification of first order expressions N80-18742
A column generation technique for the computation of stationary points
[AD-A076415] N80-18754
Documentation of a computer program for the bound-and-scan algorithm for integer linear programming
[AD-A075611] N80-18755
Conjugate-gradient methods for large-scale nonlinear optimization
[AD-A078713] N80-18759
Connected component labeling using quadtrees
[AD-A076130] N80-18771
Some properties of the dual adaptive stochastic control algorithm
[AD-A078488] N80-18779
Countable state average cost regenerative stopping problems
[AD-A078509] N80-18781
Optimal investigatiOn as a regenerative stopping problem
[AD-A078510] N80-18782
Probabilistic algorithms in finite fields
[AD-A078416] N80-18817
A center-covariance adaptive clustering algorithm --- for data reduction
[IBM-SCR-02.78] N80-18845

ALKALI METALS
The physics of spin-polarized atomic vapors
[AD-A078589] N80-18912

ALKALINE BATTERIES
Flexible formulated plastic separators for alkaline batteries
[NASA-CASE-LEW-12363-4] N80-18555
Flexible formulated plastic separators for alkaline batteries
[NASA-CASE-LEW-12363-3] N80-18556

ALKYL COMPOUNDS
Fluoroalkyl siloxanes as liquid-repellent fabric finishes. Part 2: The homopolymers and their copolymers with alkyl silanes
[AD-A073150] N80-18185

ALPHA JET AIRCRAFT
Comparison of aerodynamic coefficients obtained from theoretical calculations wind tunnel tests and flight tests data reduction for the alpha jet aircraft
[NASA-TM-75237] N80-17991

ALPINE METEOROLOGY
Mass balance and aspects of the glacier environment, Front Range, Colorado, 1969-1973
N80-18501

ALUMINUM
Design and test of a boron - aluminum high temperature wing
[AD-A075814] N80-18034
Effect of Surface Exposure Time (SET) on strength of adhesive bonds to aluminum
[AD-A077107] N80-18195
Optimization of LiAl/NaAl-Cl sub 4/CuCl sub 2 thermal cells
[AD-A076945] N80-18577
Structural and transport properties of simple metals under high pressure N80-18659

ALUMINUM ALLOYS
Environmental effects on the mechanism of fretting fatigue in 7075-T6 aluminum N80-18147
Advanced aluminum alloys from rapidly solidified powers
[AD-A077197] N80-18161
Development of advanced aluminum alloys from rapidly solidified powders for aerospace structural applications
[AD-A077800] N80-18162
Variation in the mechanical properties and in the fracture strength of an aluminum 7075 T651 plate, measured in the direction of thickness
[VTH-LR-271] N80-18168
Corrosion characteristics of aluminum alloys. Citations from the International Aerospace Abstracts data base
[PB80-801137] N80-18169

ALUMINUM COMPOUNDS
Auger spectra of ammonia on aluminum and oxidized aluminum
[AD-A078524] N80-18132

ALUMINUM OXIDES
Microstructurally developed toughening mechanisms in ceramics: Transformation toughening in the Al2O3/ZrO2 composite system
[AD-A076439] N80-18192

AMMONIA
Auger spectra of ammonia on aluminum and oxidized aluminum
[AD-A078524] N80-18132

AMORPHOUS MATERIALS
Magnetic properties of amorphous Heisenberg ferromagnet with random anisotropy
[INPR-1641-RPE/097-REV] N80-18877

AMORPHOUS SEMICONDUCTORS
The electrical switching properties of amorphous bismuth trioxide thin film devices
[AD-A077662] N80-18317

ANALOG CIRCUITS
Efficient fault analysis in linear analog circuits
[AD-A078804] N80-18314

ANALOG COMPUTERS
Signal signatures of topographic features using analog technology
[AD-A076110] N80-18536

ANALYSIS OF VARIANCE
Analysis of variance with unequal variances
[AD-A077653] N80-18866
ANELASTICITY
Anelastic studies of interstitially trapped hydrogen in niobium N80-18151
ANGULAR DISTRIBUTION
Pion scattering from the mass three system --- computation of elastic and charge exchange pion scattering angular distribution N80-18917
ANGULAR MOMENTUM
Rim inertial measuring system --- to measure angular rates and linear accelerations
[NASA-CASE-LAR-12052-1] N80-18019
ANGULAR VELOCITY
Angular vibration measurement techniques --- airborne electro-optical package disturbances
N80-18222
Fiber optic sensors for measuring angular position and rotational speed --- air breathing engines
[NASA-TM-81454] N80-18368
ANIONS
Some applications of negative ion mass spectrometry N80-18126
Charged atmospheric conglomerates role of negative ions in heteromolecular nucleation the properties of small clusters and atmospheric ions
[AD-A078962] N80-18614
ANISOTROPY
Magnetic properties of amorphous Heisenberg ferromagnet with random anisotropy
[INPR-1641-RPE/097-REV] N80-18877
ANTARCTIC REGIONS
ELF SFERIC occurences in the Antarctic during a solar proton event case study of occurences at Byrd Station during the event 9 June 1968
[AD-A078923] N80-18270
ANTENNA ARRAYS
Millimeter wave hardened antenna window materials development --- for ballistic missile defense interceptor applications
[AD-A076769] N80-18271
ANTENNA COUPLERS
Bidirectional coupler for full duplex transmission on a single fiber
[AD-A075467] N80-18925
ANTENNA DESIGN
Mathematical analysis and programming as applied to electromagnetic propagation and antenna design
[AD-A076150] N80-18266
Preliminary design of large reflectors with flat facets
[NASA-TM-80164] N80-18301
ANTENNA RADIATION PATTERNS
Analysis of arbitrarily shaped wire antennas radiating over a lossy half-space N80-18254
Comparison of measured data with IF-77 propagation model predictions
[AD-A078508] N80-18259
Analytical simulation of SPS system performance, volume 3, phase 3
[NASA-CR-160538] N80-18566
ANTIGRAVITY
A new anti-G value for high-performance aircraft
[AD-A078904] N80-18719
ANTIREFLECTION COATINGS
Preliminary study of a solar selective coating system using black cobalt oxide for high temperature solar collectors
[NASA-TM-81385] N80-18156
An evaluation of processes for the blackening of precipitation-hardened stainless steels
[AD-A075134] N80-18158
APPLICATIONS PROGRAMS (COMPUTERS)
A generalized system for application program conversion to account for database semantic changes: Design and prototype implementation N80-18745
A systematic approach to logical database design
N80-18983
APPROXIMATION
Computational complexity of real functions and polynomial time approximations N80-18746
Numerical methods and approximation and modelling problems in stochastic control theory
[AD-A078298] N80-18799
Remarks on the calculation of the kernel approximation in unsteady aerodynamics
[AAAF-NT-79-07] N80-18842
AQUEOUS SOLUTIONS
A molecular thermodynamic model for aqueous solutions of nonpolar compounds and micelle formation N80-18902
AQUIFERS
Analysis of freshwater lens formation in saline aquifers N80-18502
ARC HEATING
Methodology for making a self-absorption correction to the simple copper-line-ratio technique used for arc-tunnel enthalpy measurements
[AD-A078686] N80-18955
Some experience with arc-heater simulation of outer planet entry radiation
[NASA-TM-80192] N80-18947
ARCHITECTURE (COMPUTERS)
RELACS, an associative computer architecture to support a relational data model N80-18723
Optimal disturbed microprocessor architecture using multi-phase processing to perform a vector, matrix multiplication N80-18726
On database management system architecture
[AD-A078417] N80-18987
ARCTIC REGIONS
Crystal alignments in the fast ice of arctic Alaska
[AD-A077188] N80-18541
ARGON
Time- and space-resolved spectroscopic studies of low-current nanosecond-duration spark discharges in 90% argon and 10% hydrogen at atmospheric pressure N80-18030
ARGON PLASMA
High pressure laser plasma studies --- energy pathways in He-Ar gas mixtures at low pressure
[NASA-CR-162824] N80-18945
ARID LANDS
HCMM: Soil moisture in relation to geologic structure and lithology, northern California
[E80-10067] N80-18516
Use of satellite imagery for the derivation of the hydrogeologic characteristics of a test area in semiarid climates N80-18545
ARRAYS
Radio frequency arraying method for receivers
[NASA-CASE-NPO-14328-1] N80-18253
ARTIFICIAL INTELLIGENCE
A truth maintenance system --- artificial intelligence
[AD-A078419] N80-18770
Using patterns and plans to solve problems and control search
[AD-A076872] N80-18773
ASPECT RATIO
Effect of sweep and aspect ratio on the longitudinal aerodynamics of a spanloader wing in- and out-of-ground effect --- conducted in Langley V/STOL wind tunnel
[NASA-TM-80199] N80-17993
ASPHALT
Structural evaluation of recycled pavement materials, volumes 1 and 2 N80-18232
ASSESSMENTS
Report on the gas supply industry
[ERG-027] N80-18579
ASTROMETRY
An assessment of ground-based techniques for detecting other planetary systems. Volume 1: An overview --- workshop conclusions
[NASA-CP-2124] N80-18997
Current applications of Schmidt telescopes in astronomy N80-19001
ASTRONOMICAL CATALOGS
Double star observations made with the 26-inch refractor: 1963-1970
[ROY-OBS-BULL-164] N80-19000
ASTRONOMICAL COORDINATES
Notes on the coordinate systems and time
[INPE-1634-RPE/093] N80-18878
ASTRONOMICAL OBSERVATORIES
Solar activity predictions at Peking Observatory
N80-18475
Astronomical activities, 1977 - 1978 --- Schmidt and infrared telescope observations
[ISBN-0-9025-5321-6] N80-18999
ASTRONOMICAL PHOTOGRAPHY
Astronomical activities, 1977 - 1978 --- Schmidt and infrared telescope observations
[ISBN-0-9025-5321-6] N80-18999
ASTRONOMICAL SPECTROSCOPY
Current applications of Schmidt telescopes in astronomy N80-19001
ASTRONOMICAL TELESCOPES
Radio astronomy N80-18062
Current applications of Schmidt telescopes in astronomy N80-19001
ASTROPHYSICS
An astrophysical investigation of radius and mass anomalies among short period Cepheids
N80-19004
ASYMPTOTIC SERIES
Convergence theorems for abstract asymptotic martingales N80-18804
Asymptotic inference for eigenvectors
[AD-A078960] N80-18834
The asymptotic distribution of mortality rates in competing risks analyses
[AD-A078948] N80-18859
ATMOSPHERIC ATTENUATION
Tunable diode laser heterodyne radiometer measurement of atmospheric absorption of solar radiation
[NASA-CR-162827] N80-18383
Tropospheric water vapor absorption in the infrared window regions N80-18594
Atmospheric effects on the speed of sound
[AD-A076060] N80-18885
ATMOSPHERIC BOUNDARY LAYER
The gust as a coherent structure in the turbulent boundary layer
[FFA-TN-AU-1499-PT-5] N80-18007
ATMOSPHERIC CHEMISTRY
The sensitivity of satellite communications to the uncertainties in selected chemical reaction rate coefficients
[AD-A078924] N80-18279
The NRL CHMAIR code: A disturbed sea level air chemistry code
[AD-A077667] N80-18612
Charged atmospheric conglomerates role of negative ions in heteromolecular nucleation the properties of small clusters and atmospheric ions
[AD-A078962] N80-18614
ATMOSPHERIC CIRCULATION
The North Pacific Oscillation and eigenvectors of Northern Hemisphere atmospheric circulation during winter N80-18591
A study of the influence of orography and differential albedo on the atmospheric circulation: An application to the Brazilian Northeast
[INPE-1640-TDL/015] N80-18603
Spherical harmonic analysis of a synoptic climatology generated with a global general circulation model
[NASA-CR-162804] N80-18607
Temperature and circulation anomalies in the eastern Canadian Arctic, summer 1946 - 1976
N80-18628
Thunderstorm-environment interactions determined with three-dimensional trajectories N80-18630
Are severe winters preceded by an abnormal circulation pattern in the fall?
[KNMI-V-315] N80-18655
Correlations between the 500 mb circulation and the weather in the Netherlands
[KNMI-V-321] N80-18664
The development of computer programs to determine atmospheric winds from entry probe data and possible applications to the Pioneer Venus mission N80-19011
Convection in rotating layers with thermal winds and application to Jupiter N80-19012
ATMOSPHERIC EFFECTS
The role of the micro environment on the tribological behavior of materials
[NASA-TM-81434] N80-18245
Atmospheric effects on the speed of sound
[AD-A076060] N80-18885
ATMOSPHERIC ELECTRICITY
Positions and movement of VHF lightning sources determined with microsecond resolution by interferometry N80-18595
Nighttime/daytime optical survey of lightning and convective phenomena experiment (NOSL)
[NASA-TM-78261] N80-18608
ATMOSPHERIC ENTRY
Effect of precursor heating on radiating and chemically reacting viscous flow around a Jovian entry body N80-18329

ATMOSPHERIC IONIZATION
Airglow studies on the ionosphere dynamics over low latitude in Brazil
[INPE-1644-RPE/100-REV] N80-18600
ATMOSPHERIC MODELS
Ionospheric modeling at Air Force Global Weather Central N80-18491
Numerical modeling of high latitude winds in the upper atmosphere N80-18629
Long range weather forecasting
[KNMI-V-317] N80-18658
Numerical study of particle growth and water vapor concentration in noctilucent clouds
[AP-18] N80-18663
Description of a gradient verification program and a comparison between objectively and subjectively performed verification of the predicted currents from BK4
[KNMI-V-322] N80-18665
ATMOSPHERIC MOISTURE
The effects of spray entrainment on the mean wind profile and the overall load on marine structures N80-18335
The relationship between total precipitable water and surface dew point
[INPE-1604-RPE/084-REV] N80-18633
ATMOSPHERIC PHYSICS
Charged atmospheric conglomerates role of negative ions in heteromolecular nucleation the properties of small clusters and atmospheric ions
[AD-A078962] N80-18614
Satellite atmospheric radiance measurements in the vacuum ultraviolet
[AD-A078628] N80-18620
Calibration of an ultraviolet polychromator for rocketborne studies of aurora
[AP-19] N80-18626
COMMUTE: A computer code for noncommutative algebra --- for study of triatomic molecules in the atmosphere
[AD-A077360] N80-18905
ATMOSPHERIC REFRACTION
Summary of an eastpac refractive structure climatology
[AD-A075456] N80-18641
ATMOSPHERIC TEMPERATURE
Global frequency distribution of exospheric temperature
[AD-A077293] N80-18623
ATMOSPHERIC TURBULENCE
Analyses of the middle latitude instabilities using a quasi-geostrophic model
[INPE-1592-RPE/079] N80-18602
Stability properties of medium-scale disturbances in a balance model
[INPR-1591-RPE/078-REV] N80-18634
ATMOSPHERICS
Space activity in Norway, 1978
[SAD-80-T] N80-18078
ATOMIC COLLISIONS
Excited states of rubidium populated by stepwise excitation using a rubidium lamp and/or a tunable dye laser: Importance of redistribution collisions N80-18374
Collisional redistribution of light scattered by atomic vapors N80-18891
Rotational-vibrational excitation in collisions of atomic ions with diatomic molecules N80-18893
ATOMIC EXCITATIONS
Excited states of rubidium populated by stepwise excitation using a rubidium lamp and/or a tunable dye laser: Importance of redistribution collisions N80-18374
Summary questionaire response 7901, October 1979 --- report on heavy ions, ionic collisions, and atomic excitations
[AD-A075951] N80-18908
ATOMIC SPECTRA
Several applications of nondispersive continuum source atomic fluorescence spectrometry --- volatile metal hydrides N80-18123
ATOMIC STRUCTURE
A study of the structure of liquid helium by X-ray scattering N80-18238
Studies in the electronic structure of matter N80-18964
ATTITUDE CONTROL
Thrust augmented spin recovery device
[NASA-CASE-LAR-11970-2] N80-18048
Control system designs for the shuttle infrared telescope facility
[NASA-TM-81159] N80-18869
ATTITUDE INDICATORS
Air speed and attitude probe
[NASA-CASE-FRC-11009-1] N80-18036
AUDIOLOGY
The effects of spectral density and stimulus intensity on the elicitation of the acoustic reflex N80-18692
AUDITORY DEFECTS
The effects of spectral density and stimulus intensity on the elicitation of the acoustic reflex N80-18692
AUDITORY PERCEPTION
Continuous real-time auditory evoked potentials using a sliding window of averages N80-18699
AUDITORY STIMULI
Continuous real-time auditory evoked potentials using a sliding window of averages N80-18699
AUGER SPECTROSCOPY
Auger spectra of ammonia on aluminum and oxidized aluminum
[AD-A078524] N80-18132
AUGMENTATION
Radiation augmented combustion
[AD-A077563] N80-18138
AURORAL ARCS
Calibration of an ultraviolet polychromator for rocketborne studies of aurora
[AP-19] N80-18626
AURORAL IRRADIATION
A coherent nonlinear theory of auroral kilometric radiation
[AD-A078918] N80-18619
AURORAS
A correlation between auroral kilometric radiation and field-aligned currents
[NASA-CR-162842] N80-18611
AUSTRALIA
A review of the operation of the IUWDS Regional Warning Centre at the Ionospheric Prediction Service, Sydney N80-18482
The use of ionospheric indices to make real- and near-real-time forecasts of foF2 around Australia N80-18484
AUTOCORRELATION
A high speed digital autocorrelator and its application to mesospheric water vapor detection
[AD-A076018] N80-18609
AUTOMATA THEORY
An implicit function theorem for group equations generated by a finite automation
[AD-A078959] N80-18835
AUTOMATIC CONTROL
Discrete analog processing for tracking and guidance control
[AD-A078809] N80-18026
Automatic environmental control system for mission profile testing N80-18216
AUTOMOBILE ENGINES
Laboratory investigation of the performance of a Holden engine operating on liquified petroleum gas
[AD-A076145] N80-18411
AUTOMOBILE FUELS
Hydrogen as a fuel --- automobiles
[TT-7903] N80-18212
AUTOMOBILES
The influence of road roughness on the braking and steering performance of cars
[VTI-134] N80-18414
Implications of fuel-efficient vehicles on ride quality and passenger acceptance: Workshop proceedings
[NASA-CP-2096] N80-18990
AUTONOMIC NERVOUS SYSTEM
Features of cholinergic cardia regulation under conditions of hypokinesia
[NASA-TM-76044] N80-18687
The effects of stimulation of the anterior cingulate gyrus in cats with freedom of movement
[NASA-TM-76055] N80-18688
AUTOREGRESSIVE PROCESSES
Maximum likelihood estimation in autoregressive processes with missing observation N80-18806
AVALANCHE DIODES
An X-band array antenna module with Si-IMPATT diode amplifier. Volume 1: Text
[FOA-C-30154-E1-VOL-1] N80-18280
An X-band array antenna module with Si-IMPATT diode amplifier. Volume 2: Figures and tables
[FOA-C-30154-E1-VOL-2] N80-18281
An X-band array antenna module with GaAs IMPATT diode amplifier. Volume 1: Text
[FOA-C-30155-E1-VOL-1] N80-18282
An X-band array antenna module with GaAs IMPATT diode amplifier. Volume 2: Figures and tables
[FOA-C-30155-E1-VOL-2] N80-18283
Electron and hole photocurrent effects on IMPATT oscillators N80-18291
AVERAGE
Multiphase averaging of periodic soliton equations N80-18802
AXIAL STRESS
Fatigue behavior of nodular iron under combined static and dynamic multiaxial stresses
[LBF-FB-149] N80-18442
AXIOMS
A Heyting algebra bestiary, tertium damus --- definition of heyting algebra as a generalization of boolean algebra and it's axioms N80-18798
AZINES
Process for the preparation of new elastomeric polytriazines
[NASA-CASE-ARC-11248-2] N80-18180

B

B STARS
The formation of late O and B stars within dense molecular clouds N80-19007
B-70 AIRCRAFT
Wind-tunnel/flight correlation study of aerodynamic characteristics of a large flexible supersonic cruise airplane (XB-70-1). 3: A comparison between characteristics predicted from wind-tunnel measurements and those measured in flight
[NASA-TP-1516] N80-17986
BACKGROUND RADIATION
Aircraft program for target background, and sky radiance measurements
[AD-A076959] N80-18624
BACKSCATTERING
Backscatter measurements of sea ice with a helicopter-borne scatterometer
[AD-A077614] N80-18542
Stopping power measurement in the 20-150 KeV region using thick target back-scattering: 1H and 4He on carbon, silicon and gold N80-18900
BAFFLES
Combustion stability with baffles, absorbers and velocity sensitive combustion --- liquid propellant rocket combustors
[NASA-CR-162803] N80-18128
BALL BEARINGS
Some limitations in applying classical EHD film-thickness formulae to a high-speed bearing
[NASA-TM-81431] N80-18409
BALLOON-BORNE INSTRUMENTS
MeV gamma radiation observed by a balloon-borne Compton telescope
[MPI-PAE/EXTRATERR-151] N80-18927
Balloon-borne observations of NGC 4511 using the MISO telescope N80-18998
BANACH SPACE
Complementation, regularity and convergence of measures in Banach spaces generated by quantum logics N80-18793
K-uniformly convex Banach spaces N80-18801
Stability from the bifurcation function
[AD-A078688] N80-18814
Imperfect bifurcation and Banach space singularity theory
[CTH-MATH-1979-12] N80-18843
Convergence of weighted sums of random elements in type p spaces
[AD-A077438] N80-18864
BANDWIDTH
Models of human vision in digital image bandwidth compression N80-18697
BARLEY
Development of LANDSAT-based technology for crop inventories
[E80-10054] N80-18506
Large Area Crop Inventory Experiment (LACIE). LACIE transition year plan for the direct estimation of wheat from LANDSAT imagery --- North Dakota
[E80-10059] N80-18510

HCMM energy budget data as a model input for assessing regions of high potential groundwater pollution --- Big Sioux River Basin, SOuth Dakota
[E80-10075] N80-18524
AgRISTARS: A joint program for agriculture and resources inventory surveys through aerospace remote sensing. Development and evaluation of clustering procedures --- large area crop inventories
[E80-10079] N80-18526

BAROCLINIC WAVES
Wavelike baroclinic disturbances on shallow upper ocean density fronts N80-18669

BATCH PROCESSING
A comprehensive approach to the performance measurement and evaluation of large-scale computer systems N80-18765

BAYES THEOREM
Bayes sequential estimation procedures for life testing problems N80-18847
A Bayesian nonparametric estimator of survival probability assuming increasing failure rate
[AD-A077458] N80-18863

BEAM WAVEGUIDES
Microwave power transmission beam safety system
[NASA-CASE-NPO-14224-1] N80-18287

BEAMS (SUPPORTS)
Analysis and design of steel beam-to-column web connections N80-18241
Bending strength of vertically glued laminated beams with one to five plies
[AD-A077173] N80-18456

BEDS (PROCESS ENGINEERING)
Photochemical conversion of coal to gasoline in an entrained bed reactor N80-18202

BENDING THEORY
Environmental stress cracking of polymers
[NASA-CR-162825] N80-18182

BENZENE
Three studies in the electronic and vibrational structure of polyatomic molecules. 1: The thermal lensing spectrometer and the local mode model of vibrational overtone spectra. 2: Calculations of second order hyperpolarizabilities. 3: The molecular structure of the benzyl radical and its ions and a program for normal mode analysis N80-18119

BERYLLIUM OXIDES
Bound small polaron transitions in magnesium oxide and beryllium oxide N80-18956

BIBLIOGRAPHIES
Technology for large space systems. A special bibliography with indexes, supplement 2
[NASA-SP-7046(02)] N80-18056
Carbon and graphite. Part 3. Graphite--physical, mechanical, and structural studies, volume 2. A bibliography with abstracts
[PB80-802390] N80-18142
Carbon and graphite. Part 3. Graphite--physical, mechanical, and structural studies, volume 1. A bibliography with abstracts
[PB80-802382] N80-18143
Carbon and graphite. Part 2. Carbon and graphite composites - excluding carbon fiber composites. A bibliography with abstracts
[PB80-802374] N80-18144
Carbon and graphite. Part 1: Carbon and graphite fibers and fiber composites, volume 4. A bibliography with abstracts
[PB80-802366] N80-18145
Carbon and graphite. Part 4. Graphite--chemical properties. A bibliography with abstracts
[PB80-802408] N80-18146
Corrosion characteristics of aluminum alloys. Citations from the International Aerospace Abstracts data base
[PB80-801137] N80-18169
Corrosion characteristics of titanium alloys. Citations from the International Aerospace Abstracts data base
[PB80-801467] N80-18170
Adhesives: Properties, preparation, and applications, volume 2. A bibliography with abstracts
[PB80-801855] N80-18201
Cryogenic refrigeration, volume 3. A bibliography with abstracts
[PB80-802051] N80-18251
Frequency synthesizers. Citations from the NTIS data base
[PB80-801905] N80-18323
Frequency synthesizers. Citations from the Engineering Index data base
[PB80-801913] N80-18324
Seals and gaskets. A bibliography with abstracts
[PB80-802010] N80-18417
Nondestructive testing: X-ray photography and radiography, volume 2. Citations from the Engineering Index data base

Publications in acoustic and noise control from NASA Langley Research Center during 1940-1979 --- bibliographies
[NASA-TM-80211] N80-18884
NASA's university program: Active projects, fiscal year 1979
[NASA-TM-81777] N80-18979
Ames Research Center publications: A continuing bibliography, 1978
[NASA-TM-81175] N80-18985
Technology transfer: General and theoretical studies, volume 2. A bibliography with abstracts
[PB80-801509] N80-18995

BINARY STARS
Double star observations made with the 28-inch refractor: 1963-1970
[ROY-OBS-BULL-184] N80-19000
Evolution of pre-main-sequence binary star systems N80-19008

BIOASSAY
Methodology for estimation of total body composition in laboratory mammals
[NASA-CR-162806] N80-18679

BIOCHEMISTRY
Methodology for estimation of total body composition in laboratory mammals
[NASA-CR-162806] N80-18679

BIOELECTRICITY
The effects of stimulation of the anterior cingulate gyrus in cats with freedom of movement
[NASA-TM-76055] N80-18688

BIOGEOCHEMISTRY
The carbon isotope biogeochemistry of the individual hydrocarbons in bat guano and the ecology of insectivorous bats in the region of Carlsbad, New Mexico
[NASA-TM-81164] N80-18680

BIOINSTRUMENTATION
Multipurpose rotating machine for immobilization and conducting studies on small laboratory animals
[NASA-TM-76049] N80-18682
Induction powered biological radiosonde
[NASA-CASE-ARC-11120-1] N80-18691

BIONICS
Mass transfer studies of pulmonary function N80-18700
Application of mutual amount of information for time delay estimation --- its use in the diagnosis of epilepsy
[THT-210] N80-18714

BIOTECHNOLOGY
Multipurpose rotating machine for immobilization and conducting studies on small laboratory animals
[NASA-TM-76049] N80-18682

BLAST LOADS
Resistance of reinforced concrete structures under high intensity loads --- nuclear detonations N80-18235
Control of vibration and blast noise from surface coal mining, volume 4: Executive Report
[PB-299890/4] N80-18548
Control of vibration and blast noise from surface coal mining, volume 1
[PB-299887/0] N80-18993
Control of vibration and blast noise from surface coal mining, volume 2
[PB-299888/8] N80-18994

BLOOD CIRCULATION
Mathematical analysis of carbon dioxide transport by blood N80-18698

BLOOD COAGULATION
The effects of adrenalectomy and corticsteroid injection on the fibrinolytic activity of complex heparin compounds in the blood during immobilization
[NASA-TM-75985] N80-18685

BLUNT BODIES
Effect of precursor heating on radiating and chemically reacting viscous flow around a Jovian entry body N80-18329

BODIES OF REVOLUTION
Calculation of subsonic normal force and centre of pressure position of bodies of revolution using slender body theory boundary layer method
[AD-A076128] N80-17999

BODY COMPOSITION (BIOLOGY)
Methodology for estimation of total body composition in laboratory mammals
[NASA-CR-162806] N80-18679

BODY KINEMATICS
Numerical instability and stabilization of the kinematic differential equation using quaternions
[NASA-TM-75731] N80-18811

BODY MEASUREMENT (BIOLOGY)
Methodology for estimation of total body composition in laboratory mammals
[NASA-CR-162806] N80-18679

BODY TEMPERATURE
The human body temperature regulation system --- closed control loop
[RAE-LIB-TRANS-2019] N80-18702

BODY-WING CONFIGURATIONS
Data report for a test program to study transonic flow fields about wing-body/pylon/store combinations. Volume 1: Tunnel empty flow survey data, wing body force/moment/surface pressure data, and pressure store force/moment/surface pressure data
[AD-A077182] N80-18001
Data report for a test program to study transonic flow fields about wing-body/pylon/store combinations. Volume 2: Flow field survey data for configurations 21 and 22
[AD-A077183] N80-18002

BOEING 747 AIRCRAFT
Performance estimates of a Boeing 747-100 transport mated with an outsize cargo pod
[NASA-TM-80227] N80-18032

BOILERS
Evaluation of a photochemical system for nitrogen oxides control --- coal fired boilers N80-18583

BOLTZMANN DISTRIBUTION
The Boltzmann and the Fokker-Planck equations
[INPE-1606-RPE/082-REV] N80-18810

BONDING
Reaction bonded silicon nitride prepared from wet attrition-milled silicon --- fractography
[NASA-TM-81428] N80-18181

BOOLEAN ALGEBRA
A Heyting algebra bestiary, tertium damus --- definition of heyting algebra as a generalization of boolean algebra and it's axioms N80-18798

BORON
Design and test of a boron - aluminum high temperature wing
[AD-A075814] N80-18034
BOUNDARY LAYER CONTROL
Boundary layer control by means of suction
[NASA-TM-75502] N80-17987
Experimental study of flow due to an isolated suction hole and a partially plugged suction slot
[NASA-CR-162808] N80-18340
BOUNDARY LAYER FLOW
Investigation of the boundary layer behavior on turbine airfoils
[AD-A075501] N80-18044
Remote measurements of boundary layer velocity parameters by monostatic lidar
[AD-A078678] N80-18543
BOUNDARY LAYER STABILITY
Experimental study of flow due to an isolated suction hole and a partially plugged suction slot
[NASA-CR-162808] N80-18340
BOUNDARY LAYER TRANSITION
Investigation of the boundary layer behavior on turbine airfoils
[AD-A075501] N80-18044
BOUNDARY VALUE PROBLEMS
Boundary integral equation solution of plane elasticity problems with high stress concentrations
N80-18425
Manifolds with generalized boundary and differential semigroups N80-18800
On the estimation of functions of several variables from aggregated data
[AD-A077105] N80-18823
Problem in stability analysis of finite difference schemes for hyperbolic systems
[AD-A078853] N80-18839
BOX BEAMS
HLH rotor box beam fatigue test
[AD-A076931] N80-18450
BRAKES (FOR ARRESTING MOTION)
Moving body velocity arresting line --- elongating steel cable
[NASA-CASE-LAR-12372-1] N80-18399
BRAKING
The influence of road roughness on the braking and steering performance of cars
[VTI-134] N80-18414
BRANCHING (MATHEMATICS)
Imperfect bifurcation and Banach space singularity theory
[CTH-MATH-1979-12] N80-18843
BRAZIL
Application of statistical correlation in the study of available water in layers of Cerrado soil
[INPE-1607-TDL/014] N80-18531
Geomagnetic measurements at Sao Jose dos Campos
[INPE-1643-RPE/099-REV] N80-18599
Airglow studies on the ionosphere dynamics over low latitude in Brazil
[INPE-1644-RPE/100-REV] N80-18600
A study of the influence of orography and differential albedo on the atmospheric circulation: An application to the Brazilian Northeast
[INPE-1640-TDL/015] N80-18603
Coastal water temperatures in the southeastern portion of Brazil from oceanographic data and NOAA satellite observations, volume 1
[INPE-1569-RPE/070] N80-18671
BRIGHTNESS TEMPERATURE
Correlation of spacecraft passive microwave system data with soil moisture indices (API) --- Southern Great Plains States: Oklahoma and Kansas
[E80-10063] N80-18513
Effect of soil texture on the microwave emission from soils
[NASA-TM-80632] N80-18530
BROADBAND
Identification of noise sources in FC centrifugal fan rotors N80-18395
BROWNIAN MOVEMENTS
Coalescing Brownian motions on the line --- random walks N80-18795
BUCKLING
Collapse load analysis for plates and panels
N80-18424
Stress analysis and buckling of J-stiffened graphite-epoxy panel
[NASA-TP-1607] N80-18427
BUDGETS
Space shuttle 1980
[GPO-55-916] N80-18086
BUILDINGS
KVAST: A computer program to calculate the protection offered by buildings to fall-out radiation
[FOA-C-20321-A2] N80-18916
BUOYANCY
Convection in the Earth's mantle due to viscous shear at the core-mantle interface and due to large scale buoyancy N80-18592
BUTADIENE
Styrene-butadiene copolymerization in organolithium systems N80-18174

C

CABLES (ROPES)
Engineering feasibility of internal friction damping as a nondestructive evaluation technique for synthetic ropes
[AD-A078461] N80-18112
Moving body velocity arresting line --- elongating steel cable
[NASA-CASE-LAR-12372-1] N80-18399
CALCIUM COMPOUNDS
Calcium inorganic electrolyte battery development
[AD-A077635] N80-18576
CALCIUM FLUORIDES
The kinetics of ion motion in CaF2:Er
[AD-A077555] N80-18911
Dipolar defects in rare-earth doped alkaline-earth fluorides
[AD-A077580] N80-18971
CALCULUS OF VARIATIONS
Global and superlinear convergence of a class of scaled variable metric methods
[AD-A077098] N80-18827
Quasi-Newton methods for generalized equations
[AD-A077097] N80-18828
An energetic approach to homogenization problems with rapidly oscillating potentials
[AD-A077134] N80-18840
CALIBRATING
The Aerodynamics Division airborne data acquisition package test and calibration
[AD-A071365] N80-17997
Validation of roundtrip charged-particle calibrations derived from S- and X-band Doppler via DRVID measurements N80-18065
Test methods for telemetry systems and subsystems. Volume 1: End-to-end test methods for telemetry systems
[AD-A075735] N80-18093
Test methods for telemetry systems and subsystems. Volume 2: Test methods for telemetry RF subsystems
[AD-A075775] N80-18094
The reciprocity calibration of vibration standards over an extended frequency range N80-18224
CALIFORNIA
HCMM: Soil moisture in relation to geologic structure and lithology, northern California
[E80-10067] N80-18516
Estimation of effective hydrologic properties of soils from observations of vegetation density --- water balance of watersheds in Clinton, Maine and Santa Paula, California
[NASA-CR-162797] N80-18534
CANADA
A semi-empirical equation for the viscosity of air
[AD-A072053] N80-18342
Temperature and circulation anomalies in the eastern Canadian Arctic, summer 1946 - 1976
N80-18628
High-intensity rainfall statistics for Canada
[CRC-1329-E] N80-18632
CANADAIR AIRCRAFT
Human factors in high speed low level accidents: A 15 year review
[AD-A076221] N80-18012
CAPTIVE TESTS
A mathematical method for determining a laboratory simulation of the captive-flight vibrational environment N80-18214
Acoustics or shakers for simulation of captive flight vibration N80-18215
Automatic environmental control system for mission profile testing N80-18216
The vibration response of the PHOENIX missile in the F-14 aircraft captive-flight environment
N80-18227
CARBIDES
Hydrogen chemisorption and oxidation on transition metal carbides N80-18958
CARBOHYDRATE METABOLISM
Circadian rhythmicity in ventricular myocardial and diaphragmatic metabolism N80-18695
CARBON
Carbon and graphite. Part 2. Carbon and graphite composites - excluding carbon fiber composites. A bibliography with abstracts
[PB80-802374] N80-18144
CARBON DIOXIDE
Mathematical analysis of carbon dioxide transport by blood N80-18698
CARBON DIOXIDE LASERS
Isomerization and decomposition of 1,2 epoxy propane by intense CO2 laser radiation
[MPIS-18/1978] N80-18141
Construction of a high resolution heterodyne spectrometer for measurements of in line profiles medium infrared
[MPI-PAE/EXTRATERR-156] N80-18371
A 30-kW CO2 mixing laser
[MRL-R-751] N80-18379
Theoretical studies of laser light interaction and optical and X-ray emission from dense metallic plasmas
[AD-A078684] N80-18389
CARBON FIBER REINFORCED PLASTICS
Fire test method for graphite fiber reinforced plastics
[NASA-TM-81436] N80-18107
Influence of the orientation and the crossing of fibers on the rupturing of notched carbon fiber/epoxy composite materials
[PV-38.022] N80-18114
Acoustic fatigue strength of FRP panels
N80-18177
CARBON FIBERS
A small-scale test for fiber release from carbon composites --- pyrolysis and impact
[NASA-TM-81179] N80-18105
The potential for damage from the accidental release of conductive carbon fibers from burning composites
[NASA-TM-80213] N80-18108
Carbon and graphite. Part 1: Carbon and graphite fibers and fiber composites, volume 4. A bibliography with abstracts
[PB80-802366] N80-18145
CARBON ISOTOPES
The carbon isotope biogeochemistry of the individual hydrocarbons in bat guano and the ecology of insectivorous bats in the region of Carlsbad, New Mexico
[NASA-TM-81164] N80-18680
CARBON MONOXIDE
Catalysts for the oxidation of carbon monoxide at low temperatures
[AD-A077323] N80-18129
CARDIOVASCULAR SYSTEM
Objective measurement of human tolerance to +G sub z acceleration stress
[NASA-TM-81166] N80-18709
Cosmos 81 US/USSR cardiovascular study: Experiment implementation plan
[NASA-TM-81178] N80-18710
CARGO AIRCRAFT
Performance estimates of a Boeing 747-100 transport mated with an outsize cargo pod
[NASA-TM-80227] N80-18032
CASTINGS
Deburring die-castings by wet vibratory plant
[NASA-TM-75755] N80-18244
CATALYSIS
Contribution of surface catalysis and gas phase reaction to catalytic combustor performance
[AD-A078465] N80-18134
CATALYSTS
Catalysts for the oxidation of carbon monoxide at low temperatures
[AD-A077323] N80-18129
CATECHOLAMINE
Effect of consecutive cooling and immobilization on catecholamine metabolism in rat tissues
[NASA-TM-75962] N80-18684

CATHODE RAY TUBES
High contrast CRT
[AD-A076235] N80-18304
CATHODES
Thermionic cathode life test studies
[NASA-TM-81441] N80-18302
Investigation of the hollow cathode discharge at high current density N80-18931
CAUCHY PROBLEM
Initial value problems on non-euclidean topologies N80-18977
CEILINGS (METEOROLOGY)
Corrections for forwardly dispersed light with transmissometer (KNMI short range)
[KNMI-V-312] N80-18653
CELESTIAL MECHANICS
Notes on the coordinate systems and time
[INPE-1634-RPE/093] N80-18878
CELL ANODES
Aromatic ions as anode materials for rechargeable, ambient-temperature batteries
[AD-A078697] N80-18571
Calcium inorganic electrolyte battery development
[AD-A077685] N80-18576
CENTRIFUGAL COMPRESSORS
Identification of noise sources in FC centrifugal fan rotors N80-18395
CEPHEID VARIABLES
An astrophysical investigation of radius and mass anomalies among short period Cepheids N80-19004
CERAMICS
The nature of strength controlling machining flaws in ceramics
[AD-A075481] N80-18189
Carbon impurity effect on the thermal degradation of a Si3N4-Y2O3 ceramic
[AD-A075138] N80-18190
Ultrasonic detection of surface flaws in gas turbine ceramics
[AD-A076023] N80-18191
Microstructurally developed toughening mechanisms in ceramics: Transformation toughening in the Al2O3/ZrO2 composite system
[AD-A076439] N80-18192
Elastic/plastic indentation damage in ceramics. Part 1: The median/radial crack system. Part 2: A study of kink band formation in composites
[AD-A078839] N80-18197
CESSNA AIRCRAFT
Full scale visualization of the wing tip vortices generated by a typical agricultural aircraft
[NASA-CR-162796] N80-17992
CHANNEL CAPACITY
Practical limitations on noiseless optical channel capacity N80-18063
CHANNELS (DATA TRANSMISSION)
Practical limitations on noiseless optical channel capacity N80-18063
High-speed data link for moderate distances and noisy environments
[NASA-CASE-NPO-14152-1] N80-18252
Contributions of optimal receiver theory to digital equalization
[ETSI-04-176] N80-18284
The identification and correction of channel-to-channel phase differences within a data processing system
[REPT-79-077] N80-18365
CHARGE CARRIERS
Process variable dependence and interrelationship between avalanche injected and radiation induced carrier trapping in thermal oxides
[AD-A078362] N80-18303
CHARGE COUPLED DEVICES
Low power, compact charge coupled device signal processing system
[NASA-CR-3215] N80-18299
On-chip peripheral circuits for CCD signal processors
[AD-A076603] N80-18320
InSb charge coupled infrared imaging device: The 20 element linear imager
[NASA-CR-3235] N80-18361
CHARGE EXCHANGE
Negative ion charge transfer of the reaction of S- and O- with atomic hydrogen producing H- ions from 1500 to 10 KeV N80-18892
Pion scattering from the mass three system --- computation of elastic and charge exchange pion scattering angular distribution N80-18917
CHARGE TRANSFER
Drift tube studies of ion-molecule reactions at high and low temperatures N80-18894
CHARGED PARTICLES
Validation of roundtrip charged-particle calibrations derived from S- and X-band Doppler via DRVID measurements N80-18065
Process variable dependence and interrelationship between avalanche injected and radiation induced carrier trapping in thermal oxides
[AD-A078362] N80-18303
CHEBYSHEV APPROXIMATION
Smoothing and approximation of multivariate functions
[AD-A078640] N80-18832
CHECKOUT
Test generation for microprocessors N80-18725
CHEMICAL ANALYSIS
Chemical and physical characterization of environmental pollutants N80-18121
Preparation and properties of ((trimethyl silyl)methyl)-gallium 3 compounds
[AD-A076123] N80-18137
Applications of surface analysis techniques to studies of adhesion
[AD-A077520] N80-18198
Early diagenesis of trace metals in nearshore Long Island sound sediments N80-18670
Applied Surface Analysis Workshop --- conferences
[AD-A078830] N80-18973
CHEMICAL COMPOSITION
Initial characterization of an Experimental Referee Broadened-Specification (ERBS) aviation turbine fuel
[NASA-TM-81440] N80-18205
Testing for homogeneity of chemical composition of solid propellants by means of HPLC
[DRIC-TRANS-5685] N80-18211
Watershed constituent loading analysis utilizing empirical hydrochemical modeling techniques N80-18503
CHEMICAL EQUILIBRIUM
Effect of precursor heating on radiating and chemically reacting viscous flow around a Jovian entry body N80-18329
CHEMICAL FUELS
Internal combustion engine with electrostatic discharging fuels
[NASA-CASE-NPO-13798-2] N80-18397
CHEMICAL LASERS
Performance and diagnostics of lasers initiated by the reaction of NO with ClO2
[AD-A076010] N80-18385
Chemical laser systems: An engineering approach. Volume 1: Chemical laser analysis program
[AD-A075476] N80-18386
Flameout and acoustic damping in pulsed chemical lasers
[AD-A076124] N80-18388
CHEMICAL PROPERTIES
Carbon and graphite. Part 4. Graphite--chemical properties. A bibliography with abstracts
[PB80-802408] N80-18146
CHEMICAL REACTIONS
The analysis and characterization of the urethane functional group via fusion reaction gas chromatography N80-18124
Synthetic approaches to mixed-valence chemistry --- review of mixed valence chemical reactions and crystal growth
[AD-A078513] N80-18133
Reaction bonded silicon nitride prepared from wet attrition-milled silicon --- fractography
[NASA-TM-81428] N80-18181
The sensitivity of satellite communications to the uncertainties in selected chemical reaction rate coefficients
[AD-A078924] N80-18279
The preparation of some novel electrolytes: Synthesis of partially fluorinated alkanesulfonic acids as potential fuel cell electrolytes
[AD-A078473] N80-18570
Drift tube studies of ion-molecule reactions at high and low temperatures N80-18894
CHEMICAL REACTORS
Method of producing silicon --- gas phase reactor multiple injector liquid feed system
[NASA-CASE-NPO-14382-1] N80-18231
CHEMISORPTION
Hydrogen chemisorption and oxidation on transition metal carbides N80-18958
CHINESE PEOPLES REPUBLIC
Solar activity predictions at Peking Observatory N80-18475
CHIPS (MEMORY DEVICES)
The electrical switching properties of amorphous bismuth trioxide thin film devices
[AD-A077662] N80-18317
CHLOROPRENE RESINS
Specific solvent interactions and stress induced crystallinity in polymers N80-18176
CHROMATOGRAPHY
The application of chromatography and ancillary techniques to the characterization of shale oil/oil shale compound classes and of organometallics N80-18125
CHROMIUM COMPOUNDS
Catalyst surfaces for the chromous/chromic redox couple
[NASA-CASE-LEW-13148-2] N80-18557
CHROMIUM STEELS
Statistical evaluation of fatigue lives at and near fatigue limit for notched specimens of steel and their life distributions --- fatigue cracks
[ICAF-1131] N80-18434
CHROMOSPHERE
The forecasting center of Meudon, France --- solar activity forecasting N80-18463
Supergiant chromospheres N80-18996
CIRCADIAN RHYTHMS
Circadian rhythmicity in ventricular myocardial and diaphragmatic metabolism N80-18695
CIRCUIT RELIABILITY
Microcircuit device reliability digital failure rate data, summer 1979
[AD-A077199] N80-18313
Efficient fault analysis in linear analog circuits
[AD-A078604] N80-18314
Methods for diagnosis of faults in switching networks
[GMD-MITT-43] N80-18322
CIRCULAR CYLINDERS
Heat transfer to air from a yawed isothermal cylinder N80-18331
Multi-obstacle acoustic scattering --- circular and elliptical cylinders and flat plates N80-18880
CIRCULATORS (PHASE SHIFT CIRCUITS)
Dielectric-loaded waveguide circulator for cryogenically cooled and cascaded maser waveguide structures
[NASA-CASE-NPO-14254-1] N80-18372
CIVIL AVIATION
The aerial relay system: An energy-efficient solution to the airport congestion problem
[NASA-TM-80208] N80-18011
Continued study of NAVSTAR/GPS for general aviation
[NASA-CR-159145] N80-18020
Aeropropulsion in year 2000
[NASA-TM-81416] N80-18043
CLASSIFICATIONS
Implementation of Badhwar classification of corn/soybean segments --- Illinois, Indiana, Iowa, and Missouri
[E80-10060] N80-18511
A subjective weather typology
[KNMI-V-319] N80-18661
Combinatoric classification of multivariate normal observation vectors N80-18848
Similarity measures on binary attribute data
[AD-A077627] N80-18855
Classification of the normal subgroups of Gl sub n (R) N80-18874
CLIMATE
Summary of an eastpac refractive structure climatology
[AD-A075456] N80-18641
CLIMATOLOGY
Land use and climatological parameters in humid tropics
[INPE-1630-RPE/092] N80-18496
The North Pacific Oscillation and eigenvectors of Northern Hemisphere atmospheric circulation during winter N80-18591

Spherical harmonic analysis of a synoptic climatology generated with a global general circulation model
[NASA-CR-162804] N80-18607
Temperature and circulation anomalies in the eastern Canadian Arctic, summer 1946 - 1976
N80-18628

CLOUD COVER
Plant cover, soil temperature, freeze, water stress, and evapotranspiration conditions --- Rio Grande Valley, Texas
[E80-10072] N80-18521

CLUMPS
Studies in image segmentation algorithms based on histogram clustering and relaxation N80-18741
A center-covariance adaptive clustering algorithm --- for data reduction
[IBM-SCR-02.78] N80-18845
Production of a molecular beam of ligand-free metal clusters N80-18901

COAL
Control of vibration and blast noise from surface coal mining, volume 4: Executive Report
[PB-299890/4] N80-18548
Control of vibration and blast noise from surface coal mining, volume 2
[PB-299888/8] N80-18994

COAL LIQUEFACTION
Effects of impurities in coal-derived liquids on accelerated hot corrosion of superalloys
[NASA-TM-81384] N80-18157

COAL UTILIZATION
Photochemical conversion of coal to gasoline in an entrained bed reactor N80-18202
Evaluation of a photochemical system for nitrogen oxides control --- coal fired boilers N80-18583

COASTAL WATER
Coastal water temperatures in the southeastern portion of Brazil from oceanographic data and NOAA satellite observations, volume 1
[INPE-1569-RPE/070] N80-18671

COAXIAL CABLES
High power RF coaxial switch
[NASA-CASE-NPO-14229-1] N80-18285

COBALT OXIDES
Preliminary study of a solar selective coating system using black cobalt oxide for high temperature solar collectors
[NASA-TM-81385] N80-18156

COCKPITS
Early flight test experience with Cockpit Displayed Traffic Information (CDTI)
[NASA-TM-80221] N80-18037
The effect of viewing time, time to encounter, and practice on perception of aircraft separation on a cockpit display of traffic information
[NASA-TM-81173] N80-18038

COGNITIVE PSYCHOLOGY
The power process: A synthesis theory of power
N80-18715

COHERENT ELECTROMAGNETIC RADIATION
A coherent nonlinear theory of auroral kilometric radiation
[AD-A078918] N80-18619

COHERENT RADIATION
Application of coherence in fan noise studies
[NASA-TP-1630] N80-18882

COHERENT SCATTERING
Wind and wave observations in the mesosphere using coherent-scatter radar
[UILU-ENG-79-2508] N80-18604

COLD PLASMAS
On the propagation of relativistic nonlinear electromagnetic waves in a cold plasma
[INPE-1624-RPE/089] N80-18937

COLD WEATHER
Weather forecasting for the construction and building industry during the winter 1976 - 1977
[KNMI-V-296] N80-18642

COLLISION AVOIDANCE
Report on the task force on aircraft separation assurance, appendices --- systems analysis of collision avoidance systems integration in the air traffic control airspace utilization system
[AD-A077713] N80-18017

COLLISIONS
Hydrodynamic calculations of interstellar cloud collisions N80-19005

COLOR PHOTOGRAPHY
Method of and means for retarding dye fading during archival storage of developed color photographic film
[NASA-CASE-MFS-23250-1] N80-18362

COLORADO
Mass balance and aspects of the glacier environment, Front Range, Colorado, 1969-1973
N80-18501

COLUMNS (PROCESS ENGINEERING)
Applications of open tubular columns to the gas chromatography of volatile metal complexes
N80-18122

COLUMNS (SUPPORTS)
Analysis and design of steel beam-to-column web connections N80-18241
Dynamic stability of columns subjected to nonconservative forces
[AD-A078920] N80-18447

COMBINATORIAL ANALYSIS
Combinatoric classification of multivariate normal observation vectors N80-18848
Generalized inverses of matrices over local rings
N80-18875

COMBUSTION
Radiation augmented combustion
[AD-A077563] N80-18138

COMBUSTION CHAMBERS
Study of research and development requirements of small gas-turbine combustors
[NASA-CR-159796] N80-18040
Contribution of surface catalysis and gas phase reaction to catalytic combustor performance
[AD-A078465] N80-18134

COMBUSTION PHYSICS
Contribution of surface catalysis and gas phase reaction to catalytic combustor performance
[AD-A078465] N80-18134
Combustion simulation of a dual chamber stratified charge spark ignition engine N80-18394

COMBUSTION PRODUCTS
Fire test method for graphite fiber reinforced plastics
[NASA-TM-81436] N80-18107

COMBUSTION STABILITY
Combustion stability with baffles, absorbers and velocity sensitive combustion --- liquid propellant rocket combustors
[NASA-CR-162803] N80-18128
Calculation of attach point loads due to possible combustion instability in the space shuttle solid rocket boosters N80-18230

COMMAND AND CONTROL
Simulation of LV missile steering
[FOA-C-20318-E3] N80-18085
New methods for analysis of the performance of guidance and control systems
[AD-A078534] N80-18783

COMMERCIAL AIRCRAFT
Composite components on commerical aircraft
[NASA-TM-80231] N80-18109
Computer programs for estimating civil aircraft economics
[NASA-TM-80196] N80-18988

COMMINUTION
Reaction bonded silicon nitride prepared from wet attrition-milled silicon --- fractography
[NASA-TM-81428] N80-18181

COMMUNICATION CABLES
High-speed data link for moderate distances and noisy environments
[NASA-CASE-NPO-14152-1] N80-18252

COMMUNICATION NETWORKS
Analysis of new protocols for computer communication networks N80-18766
Software maintenance manual for the Modular System Control Development Model (MSCDM), book 1.
[AD-A078391] N80-18774
Software maintenance manual for the Modular System Control Development Model (MSCDM), book 2
[AD-A078392] N80-18775
Software maintenance manual for the Modular System Control Development Model (MSCDM), book 3
[AD-A078393] N80-18776

COMMUNICATION SATELLITES
The 30/20 GHz fixed communications systems service demand assessment. Volume 1: Executive summary
[NASA-CR-159619] N80-18262
The 30/20 GHz fixed communications systems service demand assessment. Volume 2: Main report
[NASA-CR-159620] N80-18263
The 30/20 GHz fixed communications systems service demand assessment. Volume 3: Annex
[NASA-CR-159621] N80-18264

COMMUNICATION THEORY
An evaluation of map design and map reading using eye movement recordings N80-18499
Detection, estimation, and control on group manifolds
[AD-A077707] N80-18821

COMPLEMENTS (MATHEMATICS)
Complementation, regularity and convergence of measures in Banach spaces generated by quantum logics N80-18793

COMPLEX VARIABLES
FFT as nested multiplication, with a twist
[AD-A077099] N80-18824

COMPONENT RELIABILITY
V/STOLAND avionics system flight-test data on a UH-1H helicopter
[NASA-TM-78591] N80-18047

COMPOSITE MATERIALS
A small-scale test for fiber release from carbon composites --- pyrolysis and impact
[NASA-TM-81179] N80-18105
The potential for damage from the accidental release of conductive carbon fibers from burning composites
[NASA-TM-80213] N80-18108
Hygrothermal response of polymer matrix composite materials
[AD-A076623] N80-18110
Wear of homogeneous and composite materials under conditions of repeated normal and sliding impact
[AD-A078429] N80-18111
Carbon and graphite. Part 2. Carbon and graphite composites - excluding carbon fiber composites. A bibliography with abstracts
[PB80-802374] N80-18144
The effect of particle shape of model filler on the reinforcement of elastomeric vulcanizates
N80-18173
Tackifier for addition polyimides
[NASA-CASE-LAR-12642-1] N80-18179
Elastic/plastic indentation damage in ceramics. Part 1: The median/radial crack system. Part 2: A study of kink band formation in composites
[AD-A078839] N80-18197
Experimental study of frame-wall interaction in reinforced concrete structures subjected to strong earthquake motions N80-18239
Pavement distress, evaluation, and performance
[PB80-101991] N80-18249
Thermal barrier seal
[NASA-CASE-MSC-18390-1] N80-18398
Graphics and composite material computer program enhancements for SPAR
[NASA-TM-80209] N80-18750

COMPOSITE STRUCTURES
Advanced composite aileron for L-1011 transport aircraft
[NASA-CR-162863] N80-18103
Advanced manufacturing development of a composite empennage component for l-1011 aircraft
[NASA-CR-162862] N80-18104
Composite components on commerical aircraft
[NASA-TM-80231] N80-18109

COMPRESSIBLE FLOW
Numerical calculation of steady inviscid full potential compressible flow about wind turbine blades
[NASA-TM-81438] N80-18497

COMPRESSIVE STRENGTH
Development of high strength optical fiber waveguides using residual surface compression
[AD-A078296] N80-18926

COMPRESSOR ROTORS
Identification of noise sources in FC centrifugal fan rotors N80-18395

COMPTON EFFECT
Compton scattering studies of metals and hydrides with 412 KeV gamma radiation
[AD-A078801] N80-18163

MeV gamma radiation observed by a balloon-borne Compton telescope
[MPI-PAE/EXTRATERR-151] N80-18927

COMPUTER ASSISTED INSTRUCTION

Using patterns and plans to solve problems and control search
[AD-A076872] N80-18773

COMPUTER COMPONENTS

A mathematical model for a virtual machine monitor and its supportive structure N80-18724

COMPUTER DESIGN

A mathematical model for a virtual machine monitor and its supportive structure N80-18724

COMPUTER GRAPHICS

Large Area Crop Inventory Experiment (LACIE). LACIE transition year plan for the direct estimation of wheat from LANDSAT imagery --- North Dakota
[E80-10059] N80-18510

AgRISTARS: A joint program for agriculture and resources inventory surveys through aerospace remote sensing. Development and evaluation of clustering procedures --- large area crop inventories
[E80-10079] N80-18526

Graphics and composite material computer program enhancements for SPAR
[NASA-TM-80209] N80-18750

Study of symbology for automated graphic displays
[AD-A076916] N80-18753

GRAF: An auxiliary program for presentation of functions in 90 degree coordinates with Tektronix 4051
[FOA-C-54027-H2] N80-18761

COMPUTER NETWORKS

High-speed data link for moderate distances and noisy environments
[NASA-CASE-NPO-14152-1] N80-18252

Design and analysis of the Distributed Double-Loop Computer Network (DDLCN) N80-18762

Interprocess communication and synchronization for disturbed systems N80-18764

Analysis of new protocols for computer communication networks N80-18766

Software maintenance manual for the Modular System Control Development Model (MSCDM), book 1.
[AD-A078391] N80-18774

Software maintenance manual for the Modular System Control Development Model (MSCDM), book 2
[AD-A078392] N80-18775

Software maintenance manual for the Modular System Control Development Model (MSCDM), book 3
[AD-A078393] N80-18776

The design and implementation of a relational and network database access language N80-18981

COMPUTER PROGRAMMING

Linear and almost-linear methods for the unification of first order expressions N80-18742

Design of a verifiable subset for HAL/S
[NASA-CR-162814] N80-18751

Guide to vectorization on the Naval Research Laboratory's Texas Instruments advanced scientific computer. Volume: Vectorization primer
[AD-A077365] N80-18760

A truth maintenance system --- artificial intelligence
[AD-A078419] N80-18770

Stability theory for mathematical programming problems with unbounded convex feasible regions: A point-to-set submap approach N80-18794

COMPUTER PROGRAMS

Interaction of a two-dimensional strip boundary layer with a three-dimensional transonic swept-wing code
[NASA-TM-78640] N80-17988

General aviation airplane structural crashworthiness programmer's manual
[AD-A075737] N80-18008

Nondestructive evaluation of airport pavements. Volume 1: Program references
[AD-A078835] N80-18051

Programs for the transonic wind tunnel data processing installation. Part 7: Extended focal
[AD-A073414] N80-18054

MODIFLY: A modular multi-degree-of-freedom trajectory program
[AD-A073901] N80-18079

Program documentation for the data noising program
[NASA-CR-160534] N80-18087

Orbiter subsystem hardware/software interaction analysis. Volume 8: Forward reaction control system
[NASA-TM-80959] N80-18088

Orbiter subsystem hardware/software interaction analysis. Volume 8: AFT reaction control system, part 2
[NASA-TM-80960] N80-18089

Comparison of measured data with IF-77 propagation model predictions
[AD-A076508] N80-18259

Radar surveillance/radar tracking variant to SPEARS
[AD-A076147] N80-18267

Permanent magnet and superconducting generators in airborne, high power systems --- computer program to predict weight of the generators and component systems
[AD-A078424] N80-18311

Analytical and experimental investigation of the effect of dyes on solar distillation N80-18328

Chemical laser systems: An engineering approach. Volume 1: Chemical laser analysis program
[AD-A075476] N80-18386

KAZIA: A computer system for solar-terrestrial data processing and objective prediction N80-18467

PPS76: A computerized event mode solar proton forecasting technique N80-18495

Watershed constituent loading analysis utilizing empirical hydrochemical modeling techniques N80-18503

Development of LANDSAT-based technology for crop inventories
[E80-10054] N80-18506

Development of LANDSAT-based technology for crop inventories: Appendices
[E80-10055] N80-18507

Development of mathematical techniques for the analysis of remote sensing data
[E80-10056] N80-18508

Implementation of Badhwar classification of corn/soybean segments --- Illinois, Indiana, Iowa, and Missouri
[E80-10060] N80-18511

Forest resource information system --- Baker County, Florida and Picayune, Mississippi sites; St. Regis Paper Company
[E80-10065] N80-18515

Distance preserving linear feature selection
[REPT-19] N80-18527

The easy remote sensing problem
[REPT-20] N80-18528

A mathematical model for a virtual machine monitor and its supportive structure N80-18724

Computer performance evaluation. A bibliography with abstracts
[PB80-802085] N80-18736

A methodology for free format systems design N80-18747

Programs for high-speed Fourier, Mellin and Fourier-Bessel transforms
[NASA-TM-75678] N80-18749

Graphics and composite material computer program enhancements for SPAR
[NASA-TM-80209] N80-18750

Design of a verifiable subset for HAL/S
[NASA-CR-162814] N80-18751

Portability of large COBOL programmers: The cobol programmer's workbench
[AD-A076917] N80-18752

Documentation of a computer program for the bound-and-scan algorithm for integer linear programming
[AD-A075811] N80-18755

GRAF: An auxiliary program for presentation of functions in 90 degree coordinates with Tektronix 4051
[FOA-C-54027-H2] N80-18761

Software maintenance manual for the Modular System Control Development Model (MSCDM), book 1.
[AD-A078391] N80-18774

Software maintenance manual for the Modular System Control Development Model (MSCDM), book 2
[AD-A078392] N80-18775

FFT as nested multiplication, with a twist
[AD-A077099] N80-18824

COMMUTE: A computer code for noncommutative algebra --- for study of triatomic molecules in the atmosphere
[AD-A077360] N80-18905

KVAST: A computer program to calculate the protection offered by buildings to fall-out radiation
[FOA-C-20321-A2] N80-18916

Computer programs for estimating civil aircraft economics
[NASA-TM-80196] N80-18988

The development of computer programs to determine atmospheric winds from entry probe data and possible applications to the Pioneer Venus mission N80-19011

COMPUTER STORAGE DEVICES

Management procedures for controlling data storage on the IBM system 370 computer at DRCS
[AD-A076139] N80-18734

COMPUTER SYSTEMS DESIGN

RELACS, an associative computer architecture to support a relational data model N80-18723

The design and implementation of a database management system using abstract data type
[AD-A077101] N80-18735

A methodology for free format systems design N80-18747

Design and analysis of the Distributed Double-Loop Computer Network (DDLCN) N80-18762

Interprocess communication and synchronization for disturbed systems N80-18764

COMPUTER SYSTEMS PROGRAMS

Computer prediction of three-dimensional potential flow fields in which aircraft propellers operate: Computer program description and users manual
[NASA-CR-162816] N80-17994

Orbiter subsystem hardware/software interaction analysis. Volume 8: Forward reaction control system
[NASA-TM-80959] N80-18088

Orbiter subsystem hardware/software interaction analysis. Volume 8: AFT reaction control system, part 2
[NASA-TM-80960] N80-18089

Low power, compact charge coupled device signal processing system
[NASA-CR-3215] N80-18299

MINITWIST: A shortened version of TWIST
[LBF-TB-146] N80-18438

Computer system operating manual for the meteorological mast at Cabauw
[KNMI-V-303] N80-18648

Software package description for instrument readings at Cabauw
[KNMI-V-306] N80-18649

RELACS, an associative computer architecture to support a relational data model N80-18723

Software maintenance manual for the Modular System Control Development Model (MSCDM), book 3
[AD-A078393] N80-18776

COMPUTER TECHNIQUES

Computer synthesis of flight simulation visuals
[ARL/SYS-NOTE-61] N80-18053

Utilization of 'stags' to determine knockdown factors from measured initial imperfections --- in stringer stiffened shells
[VTH-LR-275] N80-18460

Proceedings of the Image Understanding Workshop
[AD-A077568] N80-18539

Data compression, volume 2. Citations from the Engineering Index data base
[PB80-801657] N80-18737

Data compression. Citations from the NTIS data base
[PB80-801632] N80-18738

A comprehensive approach to the performance measurement and evaluation of large-scale computer systems N80-18765

COMPUTERIZED DESIGN

Solar energy design improvement: A methodology for hydronic flatplate collector systems
[AD-A076836] N80-18567

A systematic approach to logical database design N80-18983

COMPUTERIZED SIMULATION

GPS and EAR/GEANS software support
[AD-A078607] N80-18025

New remotely piloted vehicle launch and recovery concepts: Computer program listings
[AD-A076611] N80-18035
MODIFLY: A modular multi-degree-of-freedom trajectory program
[AD-A073901] N80-18079
The digital air defense missile system simulation technical effort
[AD-A078814] N80-18081
Kinetic model for a purpose carrying target finding air defense missile (KINM)
[FOA-C-20315-E3] N80-18083
Simulation of LV missile steering
[FOA-C-20318-E3] N80-18085
NASCAP modelling computations on large optics spacecraft in geosynchronous substorm environments
[NASA-TM-81395] N80-18095
Electron paramagnetic resonance studies of low symmetry nickel(I) and molybdenum (V) complexes. Part 1: Computer simulation of electron paramagnetic resonance spectra. Part 2: Electron paramagnetic resonance studies of nickel(I) triphenylphosphine complexes. Part 3: Electron paramagnetic resonance studies of a molybdenum(V) thiocyanate complex
N80-18118
Radar image simulation: A project to develop a model, define its operational constraints, validate its accuracy, and to produce sample results, volume 1 and 2 N80-18257
Radar surveillance/radar tracking variant to SPEARS
[AD-A076147] N80-18267
Analytical simulation of SPS system performance, volume 3, phase 3
[NASA-CR-160538] N80-18566
A quasi-objective method for precipitation prediction
[KNMI-V-318] N80-18660
Modeling requirements for network simulation of human-machine systems N80-18717
Similarity measures on binary attribute data
[AD-A077627] N80-18855
Computer simulation and theoretical studies of molecular liquids N80-18898
Monte Carlo simulation of neutral-beam injection for mirror fussion reactors N80-18934
A numerical simulation of charged particle interactions with interplanetary shock waves
N80-19015

CONCENTRATION (COMPOSITION)
Watershed constituent loading analysis utilizing empirical hydrochemical modeling techniques
N80-18503
On the future average mercury content of air, soil and river sediments in the European Economic Community and in the world's oceans
[EUR-6023] N80-18585
Numerical study of particle growth and water vapor concentration in noctilucent clouds
[AP-18] N80-18663

CONCRETES
Resistance of reinforced concrete structures under high intensity loads --- nuclear detonations
N80-18235
Experimental study of frame-wall interaction in reinforced concrete structures subjected to strong earthquake motions N80-18239
Response of ten story, reinforced concrete model frames to simulated earthquakes N80-18240
Longitudinal joint systems in slip-formed rigid pavements. Volume 3: User's manual --- structural analysis
[AD-A078850] N80-18243
Methodology for predicting the reflection cracking life of asphalt concrete overlays
[PB80-101710] N80-18248
Pavement distress, evaluation, and performance
[PB80-101991] N80-18249
Texturing of concrete pavements
[PB80-106032] N80-18250

CONDUCTIVE HEAT TRANSFER
Automatic thermal switch --- Space Shuttle equipment bay temperature control
[NASA-CASE-GSC-12415-1] N80-18338

CONDUCTORS
Electromagnetic transmission through a filled slit of arbitrary cross section in a conducting plane of finite thickness N80-18256
High temperature EPR study of superionic conductors and strongly exchange coupled paramagnets N80-18960

CONFERENCES
Proceedings of the 7th Ann. Tri-Service Meeting for Aircraft Engine Monitoring and Diagnostics --- conferences
[AD-A076126] N80-18045
The Shock and Vibration Bulletin. Part 4: Vibration testing, instrumentation, loads and environments, tracked vehicles --- conference proceedings
[BULL-48-PT-4] N80-18213
Proceedings of the 1st AFAPL generator and motors seminar
[AD-A078341] N80-18312
Solar-Terrestrial Predictions Proceedings. Volume 1: Prediction group reports
[NASA-CR-162794] N80-18462
LACIE evaluation and outlook panel transcript: The LACIE Symposium
[E80-10069] N80-18518
Proceedings of the Image Understanding Workshop
[AD-A077568] N80-18539
Symposium on Dissertations on Chemical Oceanography
[AD-A078526] N80-18676
Applied Surface Analysis Workshop --- conferences
[AD-A078830] N80-18973
Implications of fuel-efficient vehicles on ride quality and passenger acceptance: Workshop proceedings
[NASA-CP-2096] N80-18990
An assessment of ground-based techniques for detecting other planetary systems. Volume 1: An overview --- workshop conclusions
[NASA-CP-2124] N80-18997

CONFIDENCE LIMITS
Conservatism in random vibration analysis and testing N80-18220

CONGRESSIONAL REPORTS
Space shuttle 1980
[GPO-55-916] N80-18086

CONICAL SHELLS
Turbulent-boundary-layer excitation and response thereto for a high-performance conical vehicle --- reentry N80-18229

CONSERVATION LAWS
Mixed-mode fracture analysis using a conservation integral N80-18423

CONSTRUCTION MATERIALS
Millimeter wave hardened antenna window materials development --- for ballistic missile defense interceptor applications
[AD-A076769] N80-18271
Air pollution effects on materials. Citations from the American Petroleum Institute data base
[PB80-801871] N80-18588
Air pollution effects on materials. Citations from the NTIS data base
[PB80-801863] N80-18589

CONTINUOUS SPECTRA
Several applications of nondispersive continuum source atomic fluorescence spectrometry --- volatile metal hydrides N80-18123

CONTINUUM MECHANICS
Macroscopic description of multi-phase systems: A thermodynamic theory of flow in porous media
N80-18333

CONTROL
Orbiter subsystem hardware/software interaction analysis. Volume 8: Forward reaction control system
[NASA-TM-80959] N80-18088
Orbiter subsystem hardware/software interaction analysis. Volume 8: AFT reaction control system, part 2
[NASA-TM-80960] N80-18089

CONTROL EQUIPMENT
Aerial applications dispersal systems control requirements study --- agriculture
[NASA-CR-159781] N80-18586

CONTROL SIMULATION
The digital air defense missile system simulation technical effort
[AD-A078814] N80-18081

CONTROL STABILITY
Robustness results in LQG based multivariable control designs
[LIDS-P-976] N80-18769

CONTROL THEORY
Discrete analog processing for tracking and guidance control
[AD-A078809] N80-18026
Robustness results in LQG based multivariable control designs
[LIDS-P-976] N80-18769
Software maintenance manual for the Modular System Control Development Model (MSCDM), book 2
[AD-A078392] N80-18775
Control of dynamical systems
[AD-A078489] N80-18780
Countable state average cost regenerative stopping problems
[AD-A078509] N80-18781
Optimal investigation as a regenerative stopping problem
[AD-A078510] N80-18782
New methods for analysis of the performance of guidance and control systems
[AD-A078534] N80-18783
Incomplete block designs for comparing treatments with a control. 3: Optimal design for p = 4, k = 3 and p = 5, k = 3
[AD-A078331] N80-18784
Optimal control of systems with uncertainty --- target acquisition
[AD-A078433] N80-18785
Incomplete block designs for comparing treatments with a control. 1: General theory
[AD-A078330] N80-18786
A functional expansion approach to the solution of nonlinear feedback problems
[AD-A077408] N80-18787
Partially observed stochastic control systems
[AD-A078290] N80-18788
Numerical methods and approximation and modelling problems in stochastic control theory
[AD-A078288] N80-18789
Application of digital technology to guidance and control theory
[AD-A078815] N80-18790
A projected stochastic approximation method for adaptive filters and identifiers
[AD-A078602] N80-18812

CONTROLLABILITY
Controllability and accessibility in nonlinear control systems N80-18767

CONTROLLERS
Software development, item 0005 of microprocessor-based power conditioner controller
[AD-A076118] N80-18757
The design of deadlock- and livelock-free packet switching networks N80-18763

CONVECTION
Convection in rotating layers with thermal winds and application to Jupiter N80-19012

CONVECTION CLOUDS
Analyses of the middle latitude instabilities using a quasi-geostrophic model
[INPE-1592-RPE/079] N80-18602

CONVECTION CURRENTS
Thunderstorm-environment interactions determined with three-dimensional trajectories N80-18630

CONVECTIVE FLOW
Convection in the Earth's mantle due to viscous shear at the core-mantle interface and due to large scale buoyancy N80-18592

CONVECTIVE HEAT TRANSFER
Laminar free convective heat transfer in the supercritical region with variable fluid properties
N80-18330
Heat transfer to air from a yawed isothermal cylinder N80-18331

CONVERGENCE
Complementation, regularity and convergence of measures in Banach spaces generated by quantum logics N80-18793
No period two implies convergence, or why use tangents when secants will do --- proof of Newton's iteration versus secant iterations and where the converge
[AD-A078479] N80-18815
On the weak convergence of a sequence of general Stochastic difference equations to a diffusion
[AD-A078583] N80-18851

CONVERTERS

Convergence of the conditional distribution of the maximum likelihood estimate, given latent trait, to the asymptotic normality: Observations made through the constant information model
[AD-A077706] N80-18861

Convergence of weighted sums of random elements in type p spaces
[AD-A077438] N80-18864

CONVERTERS

A fluorescent radiation converter
[NASA-CASE-GSC-12528-1] N80-18261

CONVEXITY

K-uniformly convex Banach spaces N80-18801

Extreme points of certain convex subsets of log-convex functions
[AD-A077549] N80-18822

CONVOLUTION INTEGRALS

Deconvolution of gas chromatographic data
[NASA-CR-3229] N80-18360

Some optimal and near-optimal low rate algebraic convolution codes N80-18803

COOLANTS

Theoretical study of thermal losses: The use of hybrid and combined dry coolants --- in electrical power plants
[NT-44-1978] N80-18345

COPOLYMERIZATION

Styrene-butadiene copolymerization in organolithium systems N80-18174

COPOLYMERS

Fluoroalkyl siloxanes as liquid-repellent fabric finishes. Part 2: The homopolymers and their copolymers with alkyl silanes
[AD-A073150] N80-18185

Synthesis characterization and morphology of a cis 1, 4 polyisoprene/poly n-butylmethacrylate diblock copolymer
[AD-A078731] N80-18186

COPPER

Methodology for making a self-absorption correction to the simple copper-line-ratio technique used for arc-tunnel enthalpy measurements
[AD-A078686] N80-18055

COPPER ALLOYS

Wear of homogeneous and composite materials under conditions of repeated normal and sliding impact
[AD-A078429] N80-18111

COPPER CHLORIDES

Optimization of LiAl/NaAl-Cl sub 4/CuCl sub 2 thermal cells
[AD-A076945] N80-18577

CORN

Large Area Crop Inventory Experiment (LACIE). Evaluation of three-category classification
[E80-10058] N80-18509

Implementation of Badhwar classification of corn/soybean segments --- Illinois, Indiana, Iowa, and Missouri
[E80-10060] N80-18511

AgRISTARS: A joint program for agriculture and resources inventory surveys through aerospace remote sensing. Development and evaluation of clustering procedures --- large area crop inventories
[E80-10079] N80-18526

CORONAL HOLES

Coronal holes inferred from the Fleurs East-West solar scans N80-18487

CORRELATION

An evaluation of conventional correlation methods when matching infrared imagery to panchromatic imagery
[AD-A076111] N80-18537

CORRELATION COEFFICIENTS

The relationship between total precipitable water and surface dew point
[INPE-1604-RPE/084-REV] N80-18633

Correlations between the 500 mb circulation and the weather in the Netherlands
[KNMI-V-321] N80-18664

CORROSION

Corrosion characteristics of aluminum alloys. Citations from the International Aerospace Abstracts data base
[PB80-801137] N80-18169

Corrosion characteristics of titanium alloys. Citations from the International Aerospace Abstracts data base
[PB80-801467] N80-18170

COST ANALYSIS

Economic analysis of the design and fabrication of a space qualified power system
[NASA-TM-81418] N80-18096

COST REDUCTION

Cost minimization calculations for plane and three dimensional frame structures
[ILR-39] N80-18247

COULOMB COLLISIONS

Particle interactions in plasmas
[INPE-1589-RPE/076] N80-18940

COUPLINGS

Flared tube attach system --- fluid flow lines
[NASA-CASE-MSC-18416-1] N80-18396

COVARIANCE

A center-covariance adaptive clustering algorithm --- for data reduction
[IBM-SCR-02.78] N80-18845

CRACK PROPAGATION

Characterization of metal damage through infrared technology N80-18148

Fatigue crack growth of A508 steel in high-temperature, pressurized reactor-grade water
[AD-A075506] N80-18159

Some aspects of fatigue crack closure in titanium alloys
[AD-A076948] N80-18164

Fracture mechanics in Japan
[ICAF-1123] N80-18430

Study on crack propagation under quasi-random loading
[DOC-XIII-876-78] N80-18431

Statistical evaluation of fatigue lives at and near fatigue limit for notched specimens of steel and their life distributions --- fatigue cracks
[ICAF-1131] N80-18434

Procedures for precision measurement of fatigue-crack-growth-rate using crack-opening-displacement techniques
[AD-A077670] N80-18452

Fatigue crack growth in lugs and the stress intensity factor
[VTH-LR-273] N80-18459

CRACKING (FRACTURING)

A study of flexible pavement crack dynamics and sealants N80-18242

Methodology for predicting the reflection cracking life of asphalt concrete overlays
[PB80-101710] N80-18248

CRACKS

Elastic/plastic indentation damage in ceramics. Part 1: The median/radial crack system. Part 2: A study of kink band formation in composites
[AD-A078839] N80-18197

Stress intensity factors in two bonded elastic layers containing cracks perpendicular to and on the interface. Part 1: Analysis
[NASA-CR-159218] N80-18428

Stress intensity factors in two bonded elastic layers containing cracks perpendicular to and on the interface. Part 2: Solution and results
[NASA-CR-159219] N80-18429

Local residual stress near fatigue crack tip --- X-ray diffraction measurement technique
[ICAF-1129] N80-18433

Anti-plane shear fields with discontinuous deformation gradients near the tip of a crack in finite elastostatics
[AD-A076027] N80-18448

Procedures for precision measurement of fatigue-crack-growth-rate using crack-opening-displacement techniques
[AD-A077670] N80-18452

CRASHES

General aviation airplane structural crashworthiness programmer's manual
[AD-A075737] N80-18008

CRITICAL PRESSURE

Operation of Joule-Thompson refrigeration above the critical pressure of helium N80-18066

CRITICAL TEMPERATURE

An experimental study of the phase separation process near the critical point --- method to perform quenching on materials near critical temperature to probe the phase transformations N80-18962

CROP DUSTING

Aerial applications dispersal systems control requirements study --- agriculture
[NASA-CR-159781] N80-18586

CROP IDENTIFICATION

Large Area Crop Inventory Experiment (LACIE). LACIE transition year plan for the direct estimation of wheat from LANDSAT imagery --- North Dakota
[E80-10059] N80-18510

Large Area Crop Inventory Experiment (LACIE). Bibliographic addenda, technical reports, papers, and memorandums published under supporting research and technology and other research, test, and evaluation contracts for the Earth observations division
[E80-10070] N80-18519

Significant results from a project on agricultural statistics, 1975 - 1978
[INPE-1609-NTE/155] N80-18532

CROP INVENTORIES

Development of LANDSAT-based technology for crop inventories
[E80-10054] N80-18506

Development of LANDSAT-based technology for crop inventories: Appendices
[E80-10055] N80-18507

Development of mathematical techniques for the analysis of remote sensing data
[E80-10056] N80-18508

Large Area Crop Inventory Experiment (LACIE). Evaluation of three-category classification
[E80-10058] N80-18509

Large Area Crop Inventory Experiment (LACIE). LACIE transition year plan for the direct estimation of wheat from LANDSAT imagery --- North Dakota
[E80-10059] N80-18510

Implementation of Badhwar classification of corn/soybean segments --- Illinois, Indiana, Iowa, and Missouri
[E80-10060] N80-18511

Large Area Crop Inventory Experiment (LACIE). Composition and assembly of a spectral-met data base for spring and winter wheat, volume 2
[E80-10076] N80-18525

AgRISTARS: A joint program for agriculture and resources inventory surveys through aerospace remote sensing. Development and evaluation of clustering procedures --- large area crop inventories
[E80-10079] N80-18526

The easy remote sensing problem
[REPT-20] N80-18528

CROSS FLOW

Heat, mass and momentum transfer through sprays --- cross flow N80-18327

CRYOGENIC EQUIPMENT

Cryogenic refrigeration, volume 3. A bibliography with abstracts
[PB80-802051] N80-18251

CRYOGENIC FLUID STORAGE

Cryogenic container compound suspension strap
[NASA-CASE-ARC-11157-1] N80-18393

CRYOGENICS

Dielectric-loaded waveguide circulator for cryogenically cooled and cascaded maser waveguide structures
[NASA-CASE-NPO-14254-1] N80-18372

CRYSTAL DEFECTS

Deep level transient spectroscopy studies of radiation inducing defects in silicon N80-18963

Dipolar defects in rare-earth doped alkaline-earth fluorides
[AD-A077580] N80-18971

CRYSTAL DISLOCATIONS

Charged dislocation in ice. 1: Existence and charge density measurement by X-ray topography
[AD-A078775] N80-18540

CRYSTAL GROWTH

Synthetic approaches to mixed-valence chemistry --- review of mixed valence chemical reactions and crystal growth
[AD-A078513] N80-18133

The physics of poly(ethylene oxide)/poly (methyl methacrylate) blends --- crystal growth N80-18175

Crystal alignments in the fast ice of arctic Alaska
[AD-A077188] N80-18541

Research on InGaAs FET's
[AD-A078816] N80-18976

CRYSTAL STRUCTURE

Silicate minerals at pressure: Crystal structures and elasticity N80-18952

Crystal sites models N80-18953

Studies in the electronic structure of matter N80-18964

CRYSTALLINITY
Crystallinity, morphology, and rheology of PVC-plasticizer systems N80-18171
Specific solvent interactions and stress induced crystallinity in polymers N80-18176

CRYSTALS
Relationship of acoustic emission and ultrasonic velocity to deformation mechanisms and dilatancy during the ductile deformation of marble N80-18590
Method and apparatus for slicing crystals [NASA-CASE-GSC-12291-1] N80-18951
Crystal sites models N80-18953
Extremal effects in rotationally inelastic diffraction — scattering of molecules from vacuum cleaved magnesium oxides N80-18954
Application of nonlinear crystals [AD-A077570] N80-18974

CURRENT DENSITY
Investigation of the hollow cathode discharge at high current density N80-18931

CURVE FITTING
Synthesis of rotor test data for real-time simulation [NASA-CR-152311] N80-18029

CYCLIC LOADS
Environmental effects on the mechanism of fretting fatigue in 7075-T6 aluminum N80-18147

CYCLONES
The energy budgets of a developing cyclone over the East China Sea during the 1975 Air Mass Transformation experiment — study of potential and kinetic energy budgets N80-18627

CYCLOTRON RADIATION
Theory and design of cyclotron-wave traveling-wave amplifiers N80-18292

CYCLOTRON RESONANCE
Theory of second harmonic electron cyclotron resonance heating of Tokamak plasma [AD-A077538] N80-18950

CYCLOTRON RESONANCE DEVICES
The instability boundary and growth rate contours of the gyrotron amplifier with spreads in energy and momenta [AD-A077450] N80-18319
Methods of efficiency enhancement and scaling for the gyrotron oscillator [AD-A075133] N80-18387

CYLINDRICAL BODIES
A numerical approach to elastic-plastic plain-strain problems of thick-walled cylinders [AD-A078365] N80-18455

CYLINDRICAL CHAMBERS
An experimental and theoretical study of the confined vortex with high flow rate N80-18332

CYLINDRICAL SHELLS
Response of a circular cylindrical shell to disturbances in a half-space N80-18426

CYLINDRICAL WAVES
Non-uniform propagation of cylindrical shocks and detonations [VTH-LR-264] N80-18355

CZOCHRALSKI METHOD
Temperature compensated piezoelectric oxide materials — investigation of piezoelectric crystal growth using Czochralski method for surface acoustic wave devices with electromechanical coupling [AD-A077650] N80-18660

D

DAMPING
Engineering feasibility of internal friction damping as a nondestructive evaluation technique for synthetic ropes [AD-A078461] N80-18112
Combustion stability with baffles, absorbers and velocity sensitive combustion — liquid propellant rocket combustors [NASA-CR-162803] N80-18128

DATA ACQUISITION
The Aerodynamics Division airborne data acquisition package test and calibration [AD-A071365] N80-17997
Data acquisition for the immediate future — digital systems N80-18226
A review of the operation of the IUWDS Regional Warning Centre at the Ionospheric Prediction Service, Sydney N80-18482
Significant results from a project on agricultural statistics, 1975 - 1978 [INPE-1609-NTE/155] N80-18532
Control of vibration and blast noise from surface coal mining, volume 4: Executive Report [PB-299890/4] N80-18548
Meteorological measurements program during unified Navy field test program [AD-A075459] N80-18640

DATA BASES
Large Area Crop Inventory Experiment (LACIE). Composition and assembly of a spectral-met data base for spring and winter wheat, volume 2 [E80-10076] N80-18525
The design and implementation of a database management system using abstract data type [AD-A077101] N80-18735
A generalized system for application program conversion to account for database semantic changes: Design and prototype implementation N80-18745
A comprehensive approach to the performance measurement and evaluation of large-scale computer systems N80-18765
The design and implementation of a relational and network database access language N80-18981
A systematic approach to logical database design N80-18983
Data dependencies in relational database schemes N80-18984
On database management system architecture [AD-A076417] N80-18987

DATA COLLECTION PLATFORMS
User definition and mission requirements for unmanned airborne platforms, revised [NASA-CR-156861] N80-17981
Application of HCMM data to soil moisture snow and estuarine current studies [E80-10068] N80-18517

DATA COMPRESSION
Data compression, volume 2. Citations from the Engineering Index data base [PB80-801657] N80-18737
Data compression. Citations from the NTIS data base [PB80-801632] N80-18738
Applications of stochastic models for image data compression [AD-A078781] N80-18758

DATA CORRELATION
Wind-tunnel/flight correlation study of aerodynamic characteristics of a large flexible supersonic cruise airplane (XB-70-1). 3: A comparison between characteristics predicted from wind-tunnel measurements and those measured in flight [NASA-TP-1516] N80-17986
Correlation of spacecraft passive microwave system data with soil moisture indices (API) — Southern Great Plains States: Oklahoma and Kansas [E80-10063] N80-18513

DATA MANAGEMENT
Management procedures for controlling data storage on the IBM system 370 computer at DRCS [AD-A076139] N80-18734
The design and implementation of a database management system using abstract data type [AD-A077101] N80-18735
Calculating constraints on relational expressions [AD-A077092] N80-18829
On database management system architecture [AD-A076417] N80-18987

DATA PROCESSING
Programs for the transonic wind tunnel data processing installation. Part 7: Extended focal [AD-A073414] N80-18054
The identification and correction of channel-to-channel phase differences within a data processing system [REPT-79-077] N80-18365
KAZIA: A computer system for solar-terrestrial data processing and objective prediction N80-18467
Synthetic stellar spectra: A library of calculation programs [PUBL-SER-B-FASC-7] N80-19002

DATA PROCESSING EQUIPMENT
Data compression, volume 2. Citations from the Engineering Index data base [PB80-801657] N80-18737
Data compression. Citations from the NTIS data base [PB80-801632] N80-18738

DATA PROCESSING TERMINALS
PROPHET: An application of propagation forecasting principles N80-18488
Image selection system: Operator's procedures manual [NASA-CR-160467] N80-18986

DATA RECORDERS
The Aerodynamics Division airborne data acquisition package test and calibration [AD-A071365] N80-17997

DATA REDUCTION
Methodology for making a self-absorption correction to the simple copper-line-ratio technique used for arc-tunnel enthalpy measurements [AD-A078686] N80-18055
An analytic analysis of a Kalman filter and smoother [AD-A076140] N80-18306
Development of mathematical techniques for the analysis of remote sensing data [E80-10056] N80-18508
AgRISTARS: A joint program for agriculture and resources inventory surveys through aerospace remote sensing. Development and evaluation of clustering procedures — large area crop inventories [E80-10079] N80-18526
Distance preserving linear feature selection [REPT-19] N80-18527
The easy remote sensing problem [REPT-20] N80-18528
The Cramer-Rao lower bound as a criteria for evaluating a large data reduction system such as LACIE [REPT-21] N80-18529
A center-covariance adaptive clustering algorithm — for data reduction [IBM-SCR-02.78] N80-18845
Synthetic stellar spectra: A library of calculation programs [PUBL-SER-B-FASC-7] N80-19002

DATA SAMPLING
Optional sampling of submartingales indexed by partially ordered sets [AD-A077409] N80-18856

DATA SMOOTHING
Statistical methods of probable use for understanding remote sensing data — estimating ice pressure ridge characteristics [AD-A076908] N80-18535

DATA STORAGE
Field electron and ion source research for high density information storage system [AD-A078520] N80-18975

DATA SYSTEMS
World Weather Watch: Global Observing System - Satellite sub-system. Information on the application of meteorological satellite data in routine operations and research: Abstracts, annual summaries and bibliographies [WMO-475-SUPPL-2] N80-18631
Image selection system: Operator's procedures manual [NASA-CR-160467] N80-18986

DATA TRANSMISSION
The deep space network [NASA-CR-162795] N80-18058

DEACTIVATION
H20-N2 transition rates and line shifts of water vapor [AD-A078394] N80-18622

DECCA NAVIGATION
Omega measurements in Stockholm [FOA-C-20296-E3] N80-18027

DECISION MAKING
Rank weighting in multiattribute utility decision making: Avoiding the pitfalls of equal weights [AD-A078941] N80-18658
Quality of decision versus depth of search on game trees N80-18962

DECODING
Vite bi decoding modified for sources with memory N80-18073

DECOUPLING
Alternative decouplings of the electron propagator N80-18889

DEEP SPACE NETWORK
The deep space network [NASA-CR-162795] N80-18058
Network functions and facilities N80-18059
Viking orbiter completion mission N80-18060

Pioneer mission support N80-18061
Radio astronomy N80-18062
Operation of Joule-Thompson refrigeration above the critical pressure of helium N80-18066
Feasibility study of a spacecraft surveillance system — International Comet Exploration spacecraft solar electric propulsion stage N80-18067
The practical limits of photon communication N80-18068
An evaluation criteria model for the navigation network system design N80-18069
Tropospheric path length fluctuation in temperate semiarid locales: Application to the gravitational wave detection experiment N80-18070
GCF-NOCC reconfiguration N80-18071
Preliminary telemetry operations experience with the real-time combiner, 1 November 1978 to 1 November 1979 N80-18072
Viterbi decoding modified for sources with memory N80-18073

DEFENSE COMMUNICATIONS SYSTEM (DCS)
Software maintenance manual for the Modular System Control Development Model (MSCDM), book 1.
[AD-A078391] N80-18774

DEFORMATION
Deformation and hydrodynamic interaction of two particles in a suspension N80-18336
Relationship of acoustic emission and ultrasonic velocity to deformation mechanisms and dilatancy during the ductile deformation of marble N80-18590

DELAMINATING
Stress intensity factors in two bonded elastic layers containing cracks perpendicular to and on the interface. Part 1: Analysis
[NASA-CR-159218] N80-18428
Stress intensity factors in two bonded elastic layers containing cracks perpendicular to and on the interface. Part 2: Solution and results
[NASA-CR-159219] N80-18429

DEMAND (ECONOMICS)
The 30/20 GHz fixed communications systems service demand assessment. Volume 1: Executive summary
[NASA-CR-159619] N80-18262
The 30/20 GHz fixed communications systems service demand assessment. Volume 2: Main report
[NASA-CR-159620] N80-18263
The 30/20 GHz fixed communications systems service demand assessment. Volume 3: Annex
[NASA-CR-159621] N80-18264

DENSITY DISTRIBUTION
Wavelike baroclinic disturbances on shallow upper ocean density fronts N80-18969
A mathematical model of spatially localized neural systems N80-18607

DENSITY MEASUREMENT
A non-contracting beta backscatter gage for explosive quantity measurement N80-18225

DEPENDENCE
Data dependencies in relational database schemes N80-18984

DESIGN ANALYSIS
Shuttle Global Positioning (GPS) System design study
[NASA-CR-160539] N80-18090
Reliability analysis for optimum design
[ICAF-1132] N80-18419
Parametric study of potential early commercial MHD power plants
[NASA-CR-159633] N80-18559

DETONATION
Non-uniform propagation of cylindrical shocks and detonations
[VTH-LR-264] N80-18355

DETONATION WAVES
Perturbation solutions for blast waves in a low density gas
[VTH-LR-263] N80-18354

DEW
The relationship between total precipitable water and surface dew point
[INPE-1604-RPE/084-REV] N80-18633

DIAGNOSIS
Application of mutual amount of information for time delay estimation — its use in the diagnosis of epilepsy
[THT-210] N80-18714

DIAPHRAGM (ANATOMY)
Circadian rhythmicity in ventricular myocardial and diaphragmatic metabolism N80-18695

DIATOMIC MOLECULES
Rotational-vibrational excitation in collisions of atomic ions with diatomic molecules N80-18993

DICKE RADIOMETERS
Distributed-switch Dicke radiometers
[NASA-CASE-GSC-12219-1] N80-18359

DIELECTRICS
The influence on spark machining efficiency of the technique for inducing dielectric circulation between the work material and the electrode
[CETIM-13-G-03-0] N80-18046
Dielectric-loaded waveguide circulator for cryogenically cooled and cascaded maser waveguide structures
[NASA-CASE-NPO-14254-1] N80-18372
Development of improved wraparound contacts for silicon
[NASA-CR-159746] N80-18554
Intense relativistic electron beam investigations
[AD-A078515] N80-18920

DIES
Deburring die-castings by wet vibratory plant
[NASA-TM-75755] N80-18244

DIESEL ENGINES
Evaluation of JP-5 turbine fuel in the single cylinder cue 1790 diesel engine
[AD-A078998] N80-18206

DIFFERENCE EQUATIONS
On the weak convergence of a sequence of general Stochastic difference equations to a diffusion
[AD-A078583] N80-18651

DIFFERENTIAL CALCULUS
Manifolds with generalized boundary and differential semigroups N80-18800

DIFFERENTIAL EQUATIONS
Stability considerations for Volterra integrodifferential equations N80-18792
Numerical metability and stabilization of the kinematic differential equation using quaternions
[NASA-TM-75731] N80-18811
Remarks on bifurcation theory in differential equations
[AD-A078689] N80-19813
An example of bifurcation to homoclinic orbits
[AD-A078432] N80-18818
Stability and fixed points of point dissipative systems
[AD-A077410] N80-18675

DIFFERENTIAL GEOMETRY
Initial value problems on non-euclidean topologies N80-18977

DIFFRACTION
Extremal effects in rotationally inelastic diffraction — scattering of molecules from vacuum cleaved magnesium oxides N80-18954

DIFFUSION
On the weak convergence of a sequence of general Stochastic difference equations to a diffusion
[AD-A078583] N80-18651

DIFFUSION COEFFICIENT
Thermal conductivities and coefficients of thermal diffusion of a high-temperature plasma in a uniform magnetic field
[IPPJ-432] N80-18941

DIGITAL DATA
Data acquisition for the immediate future — digital systems N80-18226
A weighted line-finding algorithm
[AD-A078112] N80-18758

DIGITAL FILTERS
Contributions of optimal receiver theory to digital equalization
[ETSI-04-176] N80-18264
Multiple integral expansions for nonlinear filtering
[AD-A078490] N80-18816

DIGITAL NAVIGATION
A new approach to multi-sensor navigation system design — for air and digital navigation N80-18015

DIGITAL SIMULATION
Parallel digital simulation of power systems N80-18293
The analysis of delays in simulator digital computing systems. Volume 2: Formulation of discrete state transition matrices, an alternative procedure for multirate digital computations — flight control
[NASA-CR-152341] N80-18722

DIGITAL SYSTEMS
V/STOLAND avionics system flight-test data on a UH-1H helicopter
[NASA-TM-78581] N80-18047
Modular digital missile guidance
[AD-A078608] N80-18080
Data acquisition for the immediate future — digital systems N80-18226

DIGITAL TECHNIQUES
Application of digital technology to guidance and control theory
[AD-A078815] N80-18790

DIMERS
Experimental and theoretical determination of the velocity dependence of the scattering cross sections in monomer-dimer noble gas collisions
[MPIS-19/1978] N80-18915

DISCRETE FUNCTIONS
Analysis of future event set algorithms for discrete event simulation N80-18743
A linear programming approach to a simple linear regression problem with least absolute value criterion
[AD-A078622] N80-18833

DISK GALAXIES
Galactic kinematics of molecular clouds N80-19003

DISPERSING
Aerial applications dispersal systems control requirements study — agriculture
[NASA-CR-159781] N80-18586

DISPLAY DEVICES
Early flight test experience with Cockpit Displayed Traffic Information (CDTI)
[NASA-TM-80221] N80-18037
The effect of viewing time, time to encounter, and practice on perception of aircraft separation on a cockpit display of traffic information
[NASA-TM-81173] N80-18038
Computer synthesis of flight simulation visuals
[ARL/SYS-NOTE-81] N80-18053
Field impact evaluation process in Electronic Tabular Display Subsystem (ETABS)
[AD-A078846] N80-18288
High contrast CRT
[AD-A076235] N80-18304
Study of symbology for automated graphic displays
[AD-A076916] N80-18753
Image selection system: Operator's procedures manual
[NASA-CR-160467] N80-18986

DISTANCE
Distance preserving linear feature selection
[REPT-19] N80-18527

DISTILLATION
Analytical and experimental investigation of the effect of dyes on solar distillation N80-18328

DISTRIBUTED PARAMETER SYSTEMS
Design and analysis of the Distributed Double-Loop Computer Network (DDLCN) N80-18762

DISTRIBUTION FUNCTIONS
On the cumulants of cumulative processes
[AD-A078474] N80-18852

DIURNAL VARIATIONS
The French short term radiopropagation predictions in the decameter band N80-18464
Geomagnetic measurements at Sao Jose dos Campos
[INPE-1843-RPE/089-REV] N80-18599
Implication of Z variations during a near-Moon equatorial counterelectrojet on 6 March 1967, in the Indian zone
[INPE-1813-RPE/087-REV] N80-19601

DOPED CRYSTALS
The effect of nonuniform channel doping on high frequency JFET and MESFET devices N80-18294
Dipolar defects in rare-earth doped alkaline-earth fluorides
[AD-A077580] N80-18971

DOPPLER EFFECT
Validation of roundtrip charged-particle calibrations derived from S- and X-band Doppler via DRVID measurements N80-18065
Tropospheric path length fluctuation in temperate semiarid locales: Application to the gravitational wave detection experiment N80-18070
Design and performance of an experimental Dual-Frequency Doppler Lidar for remote measurement of wind velocity N80-18923

DOPPLER RADAR
Remote sensing of ocean surface current and current shear by HF backscatter radar
[AD-A078834] N80-18544
DOUBLE BASE ROCKET PROPELLANTS
Testing for homogeneity of chemical composition of solid propellants by means of HPLC
[DRIC-TRANS-5695] N80-18211
DROPS (LIQUIDS)
An accurate model for sample droplet acceleration in analytical flames
[AD-A078655] N80-18131
Heat, mass and momentum transfer through sprays --- cross flow N80-18327
DUFFING DIFFERENTIAL EQUATION
Explosion of strange attractors exhibited by Duffing's equation
[IPPJ-430] N80-18944
DUPLEXERS
Bidirectional coupler for full duplex transmission on a single fiber
[AD-A075467] N80-18925
DURABILITY
Environmental durability testing of structural adhesives. Part 3: Reliabond 500/Reliabond 398
[AD-A078953] N80-18196
Environmental durability of the Weldbond, FPL and PABST joining systems
[AD-A079608] N80-18199
DYE LASERS
Excited states of rubidium populated by stepwise excitation using a rubidium lamp and/or a tunable dye laser: Importance of redistribution collisions N80-18374
DYES
Analytical and experimental investigation of the effect of dyes on solar distillation N80-18328
DYNAMIC CHARACTERISTICS
Control of dynamical systems
[AD-A078489] N80-18780
DYNAMIC LOADS
Fatigue behavior of nodular iron under combined static and dynamic multiaxial stresses
[LBF-FB-149] N80-18442
DYNAMIC MODELS
The gust as a coherent structure in the turbulent boundary layer
[FFA-TN-AU-1499-PT-S] N80-18007
Model for the front propagation in a detonating gas
[FOA-C-20323-D6(D8)] N80-18356
DYNAMIC PROGRAMMING
Optimal discounted linear control of the Wiener process
[AD-A078487] N80-18778
On a stochastic control problem with exit constraints
[AD-A078372] N80-18853
DYNAMIC RESPONSE
Stability and frequency response of hydro-mechanical shakers in vibration rigs N80-18218
Some dynamic response environmental measurements of various tactical weapons N80-18228
Response of ten story, reinforced concrete model frames to simulated earthquakes N80-18240
The EMP response of a system of uncoupled, interconnected cables
[AD-A077659] N80-18273
Response of a circular cylindrical shell to disturbances in a half-space N80-18426
DYNAMIC STABILITY
Research on the stability of air cushion systems
[UTIAS-238] N80-17985
The dynamic stability of permanent-magnet step motors N80-18289
Dynamic stability of columns subjected to nonconservative forces
[AD-A078920] N80-18447
Stability properties of medium-scale disturbances in a balance model
[INPR-1591-RPE/079-REV] N80-18634
Controllability and accessibility in nonlinear control systems N80-18767
DYNAMIC STRUCTURAL ANALYSIS
The Shock and Vibration Bulletin. Part 4: Vibration testing, instrumentation, loads and environments, tracked vehicles --- conference proceedings
[BULL-49-PT-4] N80-18213
Structural evaluation of recycled pavement materials, volumes 1 and 2 N80-18232
Aeroelastic equations of motion of a Darrieus vertical-axis wind-turbine blade
[NASA-TM-79295] N80-18446

E

EARLY STARS
The formation of late O and B stars within dense molecular clouds N80-19007
EARTH CORE
Convection in the Earth's mantle due to viscous shear at the core-mantle interface and due to large scale buoyancy N80-18592
EARTH MANTLE
Convection in the Earth's mantle due to viscous shear at the core-mantle interface and due to large scale buoyancy N80-18592
EARTH MOVEMENTS
High frequency ground vibration measurement N80-18223
EARTHQUAKE RESISTANT STRUCTURES
Experimental study of frame-wall interaction in reinforced concrete structures subjected to strong earthquake motions N80-18239
Response of ten story, reinforced concrete model frames to simulated earthquakes N80-18240
ECOLOGY
The carbon isotope biogeochemistry of the individual hydrocarbons in bat guano and the ecology of insectivorous bats in the region of Carlsbad, New Mexico
[NASA-TM-81164] N80-18680
ECONOMETRICS
Hogan's PIES example and Lemke's algorithm
[AD-A077103] N80-18826
ECONOMIC ANALYSIS
Computer programs for estimating civil aircraft economics
[NASA-TM-80196] N80-18988
ECONOMICS
A Newton method for the PIES energy model
[AD-A077102] N80-18825
EFFERENT NERVOUS SYSTEMS
The effects of stimulation of the anterior cingulate gyrus in cats with freedom of movement
[NASA-TM-76055] N80-18688
Topochemical differences in the amount of RNA in the motoneurons of the spinal chord in hypoxia and hypokinesia
[NASA-TM-75994] N80-18689
EFFICIENCY
Methods of efficiency enhancement and scaling for the gyrotron oscillator
[AD-A075133] N80-18387
EIGENVECTORS
Asymptotic inference for eigenvectors
[AD-A078960] N80-18834
EJECTORS
Performance analysis of a type of electrohydrodynamic power generator
[AD-A076115] N80-18307
ELASTIC BENDING
Bending properties of non-homogeneous plates of isotropic and orthotropic materials
[TRITA-HFL-21] N80-18457
ELASTIC BODIES
Boundary integral equation solution of plane elasticity problems with high stress concentrations N80-18425
ELASTIC BUCKLING
Utilization of 'stags' to determine knockdown factors from measured initial imperfections --- in stringer stiffened shells
[VTH-LR-275] N80-18460
ELASTIC DAMPING
Flameout and acoustic damping in pulsed chemical lasers
[AD-A076124] N80-18388
ELASTIC DEFORMATION
Elastic/plastic indentation damage in ceramics. Part 1: The median/radial crack system. Part 2: A study of kink band formation in composites
[AD-A078839] N80-18197
ELASTIC MEDIA
Stress intensity factors in two bonded elastic layers containing cracks perpendicular to and on the interface. Part 1: Analysis
[NASA-CR-159218] N80-18428
Stress intensity factors in two bonded elastic layers containing cracks perpendicular to and on the interface. Part 2: Solution and results
[NASA-CR-159219] N80-18429
ELASTIC PLATES
A study of some aspects of the mechanical behavior of cross-spring pivots and plate spring mechanisms with negative stiffness
[WTHD-116] N80-18416
Transient acoustic radiation from elastic plates
[AD-A076772] N80-18887
ELASTIC PROPERTIES
Fracture mechanics study of fresh water ice
[TRITA-HFL-0021] N80-18458
A model of an elastic Earth by a finite element method applied to spherical shells
[SER-C/DISS-249-MITT-149] N80-18461
ELASTIC SCATTERING
Recent developments in classical wave scattering - focus on the T-matrix approach
[AD-A077579] N80-18274
Multiple scattering of acoustic, electromagnetic and elastic waves
[AD-A077577] N80-18275
Pion scattering from the mass three system --- computation of elastic and charge exchange pion scattering angular distribution N80-18917
Field theoretic model of low-energy pion-nucleon elastic scattering N80-18918
ELASTOHYDRODYNAMICS
Some limitations in applying classical EHD film-thickness formulae to a high-speed bearing
[NASA-TM-81431] N80-18409
ELASTOMERS
Process for the preparation of new elastomeric polytriazines
[NASA-CASE-ARC-11248-2] N80-18180
ELASTOPLASTICITY
Plastic analysis of metal-matrix composite laminates N80-18102
A numerical approach to elastic-plastic plain-strain problems of thick-walled cylinders
[AD-A078365] N80-18455
Fracture mechanics study of fresh water ice
[TRITA-HFL-0021] N80-18458
ELASTOSTATICS
Anti-plane shear fields with discontinuous deformation gradients near the tip of a crack in finite elastostatics
[AD-A076027] N80-18448
ELECTRIC AUTOMOBILES
Study of advanced electric propulsion system concept using a flywheel for electric vehicles
[NASA-CR-159650] N80-18991
ELECTRIC BATTERIES
European scientific notes, volume 33, no.7 --- airships, electric batteries, oceanography and fluid dynamics
[AD-A075097] N80-19019
ELECTRIC COILS
No-load testing of the shaped field superconductive motor
[AD-A076125] N80-18308
ELECTRIC CONTACTS
Liquid metal slip ring --- aerospace environments
[NASA-CASE-LEW-12277-3] N80-18300
ELECTRIC CURRENT
Electron and hole photocurrent effects on IMPATT oscillators N80-18291
Driver for solar cell I-V characteristic plots
[NASA-CASE-NPO-14096-1] N80-18551
ELECTRIC DIPOLES
The effect of electrostatic fields on reacting molecules
[AD-A077581] N80-18907
ELECTRIC DISCHARGES
Voltage feed through apparatus having reduced partial discharge
[NASA-CASE-GSC-12347-1] N80-18286
Studies of transient discharges
[AD-A078894] N80-18318
Thin film deposit and treatment of surfaces by electric discharges
[PUBL-349] N80-18321

Necessary conditions for the homogeneous formation of a volume avalanche discharge with specific applications to rare gas-halide excimer laser discharges N80-18373
A 30-kW CO2 mixing laser
[MRL-R-751] N80-18379
Investigation of the hollow cathode discharge at high current density N80-18931

ELECTRIC EQUIPMENT
The potential for damage from the accidental release of conductive carbon fibers from burning composites
[NASA-TM-80213] N80-18108

ELECTRIC EQUIPMENT TESTS
Test methods for telemetry systems and subsystems. Volume 1: End-to-end test methods for telemetry systems
[AD-A075735] N80-18093
Test methods for telemetry systems and subsystems. Volume 2: Test methods for telemetry RF subsystems
[AD-A075775] N80-18094

ELECTRIC FIELDS
Charged dislocation in ice. 1: Existence and charge density measurement by X-ray topography
[AD-A078775] N80-18540
The effect of electrostatic fields on reacting molecules
[AD-A077581] N80-18907

ELECTRIC FILTERS
FM transmission of television from rockets and balloons
[AD-A075489] N80-18258

ELECTRIC GENERATORS
Electromagnetic radiation system (EMRS) for susceptibility testing
[AD-A076953] N80-18276
A method for the transient stability enhancement of a power system using feedback control of a synchronous generator N80-18290
Parallel digital simulation of power systems N80-18293
Performance analysis of a type of electrohydrodynamic power generator
[AD-A076115] N80-18307
Permanent magnet and superconducting generators in airborne, high power systems --- computer program to predict weight of the generators and component systems
[AD-A078424] N80-18311
Proceedings of the 1st AFAPL generator and motors seminar
[AD-A078341] N80-18312

ELECTRIC MOTOR VEHICLES
An automatically-shifted two-speed transaxle system for an electric vehicle
[NASA-CR-159746] N80-18992

ELECTRIC MOTORS
The dynamic stability of permanent-magnet step motors N80-18289
No-load testing of the shaped field superconductive motor
[AD-A076125] N80-18308
Proceedings of the 1st AFAPL generator and motors seminar
[AD-A078341] N80-18312
Control strategy for a variable-speed wind energy conversion system
[NASA-TM-75512] N80-18558
Study of advanced electric propulsion system concept using a flywheel for electric vehicles
[NASA-CR-159650] N80-18991

ELECTRIC POTENTIAL
Driver for solar cell I-V characteristic plots
[NASA-CASE-NPO-14096-1] N80-18551

ELECTRIC POWER PLANTS
Theoretical study of thermal losses: The use of hybrid and combined dry coolants --- in electrical power plants
[NT-44-1978] N80-18345
Parametric study of potential early commercial MHD power plants
[NASA-CR-159633] N80-18559

ELECTRIC POWER SUPPLIES
Development of equivalents for electric power system transient stability analysis N80-18295

ELECTRIC POWER TRANSMISSION
Parallel digital simulation of power systems N80-18293

ELECTRIC SPARKS
Time- and space-resolved spectroscopic studies of low-current nanosecond-duration spark discharges in 90% argon and 10% hydrogen at atmospheric pressure N80-18930

ELECTRICAL RESISTANCE
Specification for the installation of electrical resistance strain gauges on strain pairs counter aircraft --- to monitor fatigue damage
[AD-A071363] N80-18369

ELECTRICAL RESISTIVITY
A theoretical search for super-velocity semiconductors
[AD-A078719] N80-18316

ELECTRO-OPTICS
Angular vibration measurement techniques --- airborne electro-optical package disturbances N80-18222
Electro-optical handbook. Volume 1: Weather support for precision guided munitions
[AD-A075168] N80-18637

ELECTROCHEMICAL CELLS
Electrochemical investigation of hot corrosion N80-18150
The storage of electrochemical energy N80-18578
Semiconductor electrodes 25: The p-GaAs/heatyl viologen system. Photoelectrochemical cells and photoelectrochromic displays
[AD-A075812] N80-18965

ELECTROCHEMICAL CORROSION
Electrochemical investigation of hot corrosion N80-18150

ELECTROCHEMISTRY
Spectroelectrochemical monitoring of electrode reactions by multiple specular reflectance spectroscopy
[AD-A076951] N80-18139
Electrochemical investigation of hot corrosion N80-18150
Catalyst surfaces for the chromous/chromic redox couple
[NASA-CASE-LEW-13148-2] N80-18557
Analysis of pressure producing reactions in lithium-sulfur dioxide cells
[AD-A077379] N80-18574
Electrochemical kinetics at metal and semiconductor surfaces: Role of interfacial energy barriers N80-18961

ELECTRODES
Spectroelectrochemical monitoring of electrode reactions by multiple specular reflectance spectroscopy
[AD-A076951] N80-18139
Electrochemical investigation of hot corrosion N80-18150
Semiconductor electrodes 25: The p-GaAs/heatyl viologen system. Photoelectrochemical cells and photoelectrochromic displays
[AD-A075812] N80-18965
Semiconductor electrodes 27: The p- and n-GaAs-N, N'-dimethyl-4, 4'-bipyridinium system, enhancement of hydrogen evolution on p-GaAs and stabilization of n-GaAs electrodes
[AD-A075813] N80-18966

ELECTRODYNAMICS
Covariant electrodynamics in a medium N80-18895

ELECTROHYDRODYNAMICS
Performance analysis of a type of electrohydrodynamic power generator
[AD-A076115] N80-18307

ELECTROKINETICS
Electrochemical kinetics at metal and semiconductor surfaces: Role of interfacial energy barriers N80-18961

ELECTROLYTE METABOLISM
Experimental investigation of the role of thyrocalcitonin in the prophylaxis of disturbances in the water-salt and mineral metabolism during a 30-day hypokinesia
[NASA-TM-75938] N80-18704

ELECTROLYTES
The preparation of some novel electrolytes: Synthesis of partially fluorinated alkanesulfonic acids as potential fuel cell electrolytes
[AD-A078473] N80-18570

ELECTROLYTIC CELLS
Safety studies of lithium-sulfur dioxide cells
[AD-A078961] N80-18569

ELECTROMAGNETIC COMPATIBILITY
Electromagnetic radiation system (EMRS) for susceptibility testing
[AD-A076953] N80-18276

ELECTROMAGNETIC PULSES
The EMP response of a system of uncoupled, interconnected cables
[AD-A077659] N80-18273

ELECTROMAGNETIC RADIATION
ELF SFERIC occurrences in the Antarctic during a solar proton event case study of occurences at Byrd Station during the event 9 June 1968
[AD-A078923] N80-18270
Electromagnetic radiation system (EMRS) for susceptibility testing
[AD-A076953] N80-18276
On the propagation of relativistic nonlinear electromagnetic waves in a cold plasma
[INPE-1624-RPE/089] N80-18937

ELECTROMAGNETIC SCATTERING
Recent developments in classical wave scattering - focus on the T-matrix approach
[AD-A077579] N80-18274
Multiple scattering of acoustic, electromagnetic and elastic waves
[AD-A077577] N80-18275

ELECTROMAGNETIC WAVE TRANSMISSION
Electromagnetic transmission through a filled slit of arbitrary cross section in a conducting plane of finite thickness N80-18256
Mathematical analysis and programming as applied to electromagnetic propagation and antenna design
[AD-A076150] N80-18266
PROPHET: An applicaton of propagation forecasting principles N80-18488
On the propagation of relativistic nonlinear electromagnetic waves in a cold plasma
[INPE-1624-RPE/089] N80-18937

ELECTROMECHANICAL DEVICES
Broad-band mechanical vibration amplifier N80-18217

ELECTROMECHANICS
Temperature compensated piezoelectric oxide materials --- investigation of piezoelectric crystal growth using Czochralski method for surface acoustic wave devices with electromechanical coupling
[AD-A077650] N80-18969

ELECTROMOTIVE FORCES
Flexible formulated plastic separators for alkaline batteries
[NASA-CASE-LEW-12363-4] N80-18555
Flexible formulated plastic separators for alkaline batteries
[NASA-CASE-LEW-12363-3] N80-18556

ELECTRON ACCELERATORS
Research activities in high energy physics, 1978 --- particle theory experimentation and instrumentation N80-18922

ELECTRON BEAMS
The instability boundary and growth rate contours of the gyrotron amplifier with spreads in energy and momenta
[AD-A077450] N80-18319

ELECTRON CAPTURE
Ultraviolet spectroscopy of electron trapping centers in thermally grown SiO films N80-18955

ELECTRON CYCLOTRON HEATING
Theory of second harmonic electron cyclotron resonance heating of Tokamak plasma
[AD-A077538] N80-18950

ELECTRON PARAMAGNETIC RESONANCE
Electron paramagnetic resonance studies of low symmetry nickel(I) and molybdenum (V) complexes. Part 1: Computer simulation of electron paramagnetic resonance spectra. Part 2: Electron paramagnetic resonance studies of nickel(I) triphenylphosphine complexes. Part 3: Electron paramagnetic resonance studies of a molybdenum(V) thiocyanate complex N80-18118
High temperature EPR study of superionic conductors and strongly exchange coupled paramagnets N80-18960

ELECTRON PLASMA
A numerical investigation of the two stream instability and resonant heating of an inhomogeneous, axisymmetric, plasma column N80-18326
Excitation of electron plasma waves N80-18929
The interaction of large-amplitude plasma waves with a moving electron plasma
[INPE-1626-RPE/091] N80-18936

ELECTRON SCATTERING
Research activities in high energy physics, 1978 --- particle theory experimentation and instrumentation N80-18922

ELECTRON SOURCES
Field electron and ion source research for high density information storage system
[AD-A078520] N80-18975

ELECTRON SPIN
Spin waves in itinerant electron spin density wave states --- and the magnetic permeability
[INPE-1594-RPE/080-REV] N80-18903

ELECTRON STATES
Spin waves in itinerant electron spin density wave states --- and the magnetic permeability
[INPE-1594-RPE/080-REV] N80-18903

ELECTRON TUBES
Bonded grid development
[AD-A078631] N80-18309

ELECTRON TUNNELING
Inelastic electron tunneling spectroscopy of UV irradiated molecules N80-18116

ELECTRONIC EQUIPMENT
Analytical core loss calculations for magnetic materials used in high frequency high power converter applications N80-18297

ELECTRONIC EQUIPMENT TESTS
Test methods for telemetry systems and subsystems. Volume 3: Test methods for recorder/reproducer systems and magnetic tape
[AD-A075736] N80-18091
Test methods for telemetry systems and subsystems. Volume 4: Test methods for data multiplex equipment
[AD-A075789] N80-18092
Test generation for microprocessors N80-18725

ELECTRONIC MODULES
Global Positioning Systems (GPS). Manpack/Vehicular User Equipment (MVUE). Volume 2: Set description
[AD-A076483] N80-18022
Global Positioning System (GPS). Manpack/Vehicular User Equipment (MVUE). Volume 3: Set description
[AD-A076484] N80-18023
Modular digital missile guidance
[AD-A078808] N80-18080

ELECTRONIC PACKAGING
Alternative method for the evaluation of fused glass-to-metal seals
[AD-A077514] N80-18412

ELECTRONIC RECORDING SYSTEMS
Test methods for telemetry systems and subsystems. Volume 3: Test methods for recorder/reproducer systems and magnetic tape
[AD-A075736] N80-18091

ELECTRONIC TRANSDUCERS
Distributed-switch Dicke radiometers
[NASA-CASE-GSC-12219-1] N80-18359

ELECTRONICS
Solid state research
[AD-A078676] N80-18972

ELECTRONS
Electron and hole photocurrent effects on IMPATT oscillators N80-18291
Alternative decouplings of the electron propagator N80-18899

ELECTROPHYSIOLOGY
The effects of stimulation of the anterior cingulate gyrus in cats with freedom of movement
[NASA-TM-76055] N80-18688

ELECTROSTATIC WAVES
The interaction of large-amplitude plasma waves with a moving electron plasma
[INPE-1626-RPE/091] N80-18936

ELECTROSTATICS
The effect of electrostatic fields on reacting molecules
[AD-A077581] N80-18907

ELEMENTARY PARTICLE INTERACTIONS
Research activities in high energy physics, 1977 N80-18921

ELLIPTICAL CYLINDERS
Multi-obstacle acoustic scattering --- circular and elliptical cylinders and flat plates N80-18880

ELONGATION
Moving body velocity arresting line --- elongating steel cable
[NASA-CASE-LAR-12372-1] N80-18399

EMERGENCY LIFE SUSTAINING SYSTEMS
Prototype: Preliminary study on emergency breathing apparatus
[FOA-C-40103-C2] N80-18720

EMISSION
Multiphoton contributions to far infrared generation in optically pumped deuterium oxide N80-18377

EMISSION SPECTRA
Infrared emission spectroscopy of low pressure gaseous discharges, II
[AD-A078796] N80-18130

ENERGETIC PARTICLES
Stimulated-Emission-of-Energetic-Particles (SEEP) experiment
[AD-A075503] N80-18269
Examples of problem flares or situations in past solar-terrestrial observations N80-18493

ENERGY
The storage of electrochemical energy N80-18578

ENERGY BUDGETS
The energy budgets of a developing cyclone over the East China Sea during the 1975 Air Mass Transformation experiment --- study of potential and kinetic energy budgets N80-18627

ENERGY CONSUMPTION
A Newton method for the PIES energy model
[AD-A077102] N80-18825
Hogan's PIES example and Lemke's algorithm
[AD-A077103] N80-18826

ENERGY CONVERSION
Control strategy for a variable-speed wind energy conversion system
[NASA-TM-75512] N80-18558

ENERGY DISSIPATION
Theoretical study of thermal losses: The use of hybrid and combined dry coolants --- in electrical power plants
[NT-44-1978] N80-18345

ENERGY POLICY
Experimental alcohol fuel plants
[ATF-P-5000-2] N80-18203
Alcohol fuels information directory
[ATF-P-5000-3] N80-18204
Hydrogen as a fuel --- automobiles
[TT-7903] N80-18212
Appendix: MOD-1 wind turbine generator analysis and design report, volume 2
[NASA-CR-159495] N80-18565
A feasibility study of windpower for the New England area
[AD-A076614] N80-18568
Report on the gas supply industry
[ERG-027] N80-18579

ENERGY STORAGE
Catalyst surfaces for the chromous/chromic redox couple
[NASA-CASE-LEW-13148-2] N80-18557
Aromatic ions as anode materials for rechargeable, ambient-temperature batteries
[AD-A078697] N80-18571
High rate stable nickel-cadmium batteries
[AD-A078714] N80-18572
Safety studies of lithium-sulfur dioxide cells
[AD-A077277] N80-18573
Analysis of pressure producing reactions in lithium-sulfur dioxide cells
[AD-A077379] N80-18574
Lithium-thionyl chloride battery
[AD-A077162] N80-18575
Calcium inorganic electrolyte battery development
[AD-A077685] N80-18576
The storage of electrochemical energy N80-18578
Study of advanced electric propulsion system concept using a flywheel for electric vehicles
[NASA-CR-159650] N80-18991

ENERGY TECHNOLOGY
Geothermal energy development in the eastern United States. Evaluation of potential geothermal resource areas
[PB-299925/8] N80-18547
Parametric study of potential early commercial MHD power plants
[NASA-CR-159633] N80-18559
Appendix: MOD-1 wind turbine generator analysis and design report, volume 2
[NASA-CR-159496] N80-18565

ENERGY TRANSFER
Theory and design of cyclotron-wave traveling-wave amplifiers N80-18292
Applications of HCMM satellite data --- water quality, hydrology, and energy exchange of Lake Erie and Lake Ontario
[E80-10071] N80-18520
A crucial demonstration of strong collision behavior of vibrational energy for gas-surface collisions
[AD-A078800] N80-18910

ENGINE DESIGN
Method and apparatus for rapid thrust increases in a turbofan engine
[NASA-CASE-LEW-12971-1] N80-18039
Analysis and design of a uniform-clearance, pumping-ring rod seal for the Stirling engine
[NASA-TM-81463] N80-18408
The application of reliability improvement warranty to dynamic systems
[AD-A075520] N80-18419

ENGINE PARTS
Gas path seal
[NASA-CASE-NPO-12131-3] N80-18400

ENGINE TESTS
Evaluation of JP-5 turbine fuel in the single cylinder cue 1790 diesel engine
[AD-A078686] N80-18206
Laboratory investigation of the performance of a Holden engine operating on liquified petroleum gas
[AD-A076145] N80-18411
Overview of a stirling engine test project
[NASA-TM-81442] N80-18564

ENGINES
Combustion simulation of a dual chamber stratified charge spark ignition engine N80-18394

ENTHALPY
Methodology for making a self-absorption correction to the simple copper-line-ratio technique used for arc-tunnel enthalpy measurements
[AD-A078686] N80-18055

ENTRAINMENT
The effects of spray entrainment on the mean wind profile and the overall load on marine structures N80-18335

ENVIRONMENT POLLUTION
Chemical and physical characterization of environmental pollutants N80-18121

ENVIRONMENT PROTECTION
Aerial applications dispersal systems control requirements study --- agriculture
[NASA-CR-159781] N80-18586

ENVIRONMENT SIMULATION
Some dynamic response environmental measurements of various tactical weapons N80-18328

ENVIRONMENTAL MONITORING
LACIE evaluation and outlook panel transcript: The LACIE Symposium
[E80-10069] N80-18518

ENVIRONMENTAL TESTS
Automatic environmental control system for mission profile testing N80-18216
Solar radiation test
[AD-A075734] N80-19018

ENZYMOLOGY
Effect of the enzymatic inhibitor of Kunitz on the gastric lesions from reserpine, from phenylbutazone, from pyloric ligation and by restraint in the rat
[NASA-TM-76027] N80-18681
Effect of restricted motion in high temperature on enzymatic activity of the pancreas
[NASA-TM-76063] N80-18683

EPHEMERIDES
Control networks for the Galilean satellites, November 1979
[NASA-CR-162799] N80-18057

EPILEPSY
Application of mutual amount of information for time delay estimation --- its use in the diagnosis of epilepsy
[THT-210] N80-18714

EPITAXY
Research on InGaAs FET's
[AD-A078816] N80-18976

EPOXY COMPOUNDS
Isomerization and decomposition of 1,2 epoxy propane by intense CO2 laser radiation
[MPIS-18/1978] N80-18141

EPOXY RESINS
Development and test of low-impact resistant towers
[AD-A077160] N80-18052
EQUATIONS OF MOTION
Aeroelastic equations of motion of a Darrieus vertical-axis wind-turbine blade
[NASA-TM-79295] N80-18446
EQUATIONS OF STATE
Detection, estimation, and order reduction in multiparameter singularly perturbed systems
N80-18288
EQUATORIAL ELECTROJET
Electric fields in the low latitude ionosphere and their relationship to magnetospheric and interplanetary phenomena N80-18597
Implication of Z variations during a near-Moon equatorial counterelectrojet on 6 March 1967, in the Indian zone
[INPE-1613-RPE/087-REV] N80-18601
EQUIPMENT SPECIFICATIONS
MIL-STD-781C random reliability testing performed by using acoustic coupling N80-18219
EQUIVALENT CIRCUITS
Development of equivalents for electric power system transient stability analysis N80-18295
EROSION
The influence on spark machining efficiency of the technique for inducing dielectric circulation between the work material and the electrode
[CETIM-13-G-03-0] N80-18246
ERROR ANALYSIS
Error rates in Poisson discrimination N80-18846
Similarity measures on binary attribute data
[AD-A077627] N80-18855
ERROR CORRECTING CODES
The identification and correction of channel-to-channel phase differences within a data processing system
[REPT-79-077] N80-18365
ERROR CORRECTING DEVICES
Methods for diagnosis of faults in switching networks
[GMD-MITT-43] N80-18322
ERROR DETECTION CODES
Efficient fault analysis in linear analog circuits
[AD-A078604] N80-18314
The identification and correction of channel-to-channel phase differences within a data processing system
[REPT-79-077] N80-18365
ESTIMATING
Statistical methods of probable use for understanding remote sensing data --- estimating ice pressure ridge characteristics
[AD-A076908] N80-18535
Using incomplete multivariate data to simultaneously estimate the means N80-18849
ESTUARIES
Turbulent mixing processes in a partially mixed estuary N80-18504
Application of HCMM data to soil moisture snow and estuarine current studies
[E80-10068] N80-18517
EUCLIDEAN GEOMETRY
Manifolds with generalized boundary and differential semigroups N80-18800
EUROPE
On the future average mercury content of air, soil and river sediments in the European Economic Community and in the world's oceans
[EUR-6023] N80-18585
European scientific notes, volume 33, no.7 --- airships, electric batteries, oceanography and fluid dynamics
[AD-A075097] N80-19019
EUROPEAN SPACE PROGRAMS
Space activity in Norway, 1978
[SAD-80-T] N80-18078
EUTROPHICATION
Symposium on Dissertations on Chemical Oceanography
[AD-A078526] N80-18676
EVAPORATION
Precipitation, open water evaporation and potential precipitation surplus in the Netherlands: Frequency distributions in the growing season
[KNMI-WR-79-4] N80-18662
EVAPORATION RATE
Analytical and experimental investigation of the effect of dyes on solar distillation N80-18328
EVAPOTRANSPIRATION
Plant cover, soil temperature, freeze, water stress, and evapotranspiration conditions --- Rio Grande Valley, Texas
[E80-10072] N80-18521
EVOKED RESPONSE (PSYCHOPHYSIOLOGY)
Continuous real-time auditory evoked potentials using a sliding window of averages N80-18699
EXCIMER LASERS
Necessary conditions for the homogeneous formation of a volume avalanche discharge with specific applications to rare gas-halide excimer laser discharges N80-18373
EXHAUST DIFFUSERS
An experimental investigation of two large annular diffusers with swirling and distorted inflow
[NASA-TP-1628] N80-17984
EXHAUST EMISSION
Control of particulate emissions from turbine engine test cells by cooling water injection
[AD-A075947] N80-18587
EXISTENCE THEOREMS
Partially observed stochastic control systems
[AD-A078290] N80-18788
EXOBIOLOGY
Recent data on planets in the solar system
N80-19014
EXOSPHERE
Global frequency distribution of exospheric temperature
[AD-A077293] N80-18623
EXPERIMENTAL DESIGN
GEOS-2: Report on the first six months of routine operations N80-18077
Methodology for predicting the reflection cracking life of asphalt concrete overlays
[PB80-101710] N80-18248
EXPLORATION
Geothermal energy development in the eastern United States. Evaluation of potential geothermal resource areas
[PB-299925/8] N80-18547
EXPLOSIONS
Lidar observations at 0.7-micrometers and 10.6-micrometers wavelengths during dusty infrared test 1 (dirt-1)
[AD-A075275] N80-18924
EXPLOSIVE DEVICES
Pressure limiting propellant actuating system
[NASA-CASE-MSC-18179-1] N80-18097
EXPLOSIVES
A non-contracting beta backscatter gage for explosive quantity measurement N80-18225
EXTERNAL STORES
Data report for a test program to study transonic flow fields about wing-body/pylon/store combinations. Volume 1: Tunnel empty flow survey data, wing body force/moment/surface pressure data, and pressure store force/moment/surface pressure data
[AD-A077182] N80-18001
Data report for a test program to study transonic flow fields about wing-body/pylon/store combinations. Volume 2: Flow field survey data for configurations 21 and 22
[AD-A077183] N80-18002
EXTERNAL TANKS
Infrared scanner concept verification test report
[NASA-TM-78264] N80-18367
EXTINCTION
The effects of relative humidity on atmospheric aerosol extinction in the 3-5 micrometers and 8-15 micrometers spectral regions
[AD-A070159] N80-18610
EXTRAPOLATION
The use of linear prediction for the interpolation and extrapolation of missing data and data gaps prior to spectral analysis
[AD-A075515] N80-18268
EXTREMELY LOW FREQUENCIES
ELF SFERIC occurrences in the Antarctic during a solar proton event case study of occurrences at Byrd Station during the event 9 June 1968
[AD-A078923] N80-18270
EYE (ANATOMY)
Intra-ocular pressure normalization technique and equipment
[NASA-CASE-LEW-12723-1] N80-18690
EYE MOVEMENTS
An evaluation of map design and map reading using eye movement recordings N80-18499

F

F REGION
A simplified indexing of F-region geophysical noise at low latitudes N80-18473
Computer simulation of gradient drift instability processes in operation Avefna
[AD-A077668] N80-18613
ALTAIR observations of ionospheric irregularities and background densities
[AD-A078599] N80-18615
Preliminary numerical study of the outer scale size of ionospheric plasma cloud striations
[AD-A078492] N80-18618
F 2 REGION
The use of ionospheric indices to make real- and near-real-time forecasts of foF2 around Australia
N80-18484
Prediction limits for foF2 N80-18485
A weekly ionospheric index N80-18486
F-14 AIRCRAFT
The vibration response of the PHOENIX missile in the F-14 aircraft captive-flight environment
N80-18227
F-15 AIRCRAFT
A new anti-G value for high-performance aircraft
[AD-A076604] N80-18719
F-16 AIRCRAFT
An investigation of F-16 nozzle-afterbody forces at transonic Mach numbers with emphasis on support system interference
[AD-A078693] N80-18046
F-104 AIRCRAFT
Human factors in high speed low level accidents: A 15 year review
[AD-A076221] N80-18012
FACTOR ANALYSIS
AgRISTARS: A joint program for agriculture and resources inventory surveys through aerospace remote sensing. Development and evaluation of clustering procedures --- large area crop inventories
[E80-10079] N80-18526
Distance preserving linear feature selection
[REPT-19] N80-18527
FACTORIAL DESIGN
The effects of selected graphic design variables on the readability of multiple-line graphs N80-18850
FAILURE ANALYSIS
Endurance and failure characteristics of modified Vasco X-2, CBS 600 and AISI 9310 spur gears --- aircraft construction materials
[NASA-TM-81421] N80-18405
The extreme points of the set of decreasing failure rate distributions
[AD-A078774] N80-18838
Asymptotic measures of system performance under alternative operating rules, 2 --- failure and repair stochastic processes
[AD-A078827] N80-18870
FAILURE MODES
Incandescent lamp life under random vibration
N80-18221
The processing resource demands of failure detection in dynamic systems
[AD-A078329] N80-18420
FALLOUT
KVAST: A computer program to calculate the protection offered by buildings to fall-out radiation
[FOA-C-20321-A2] N80-18916
FAR FIELDS
Analytical simulation of SPS system performance, volume 3, phase 3
[NASA-CR-160538] N80-18566
FAR INFRARED RADIATION
Multiphoton contributions to far infrared generation in optically pumped deuterium oxide N80-18377
FAR ULTRAVIOLET RADIATION
Satellite atmospheric radiance measurements in the vacuum ultraviolet
[AD-A078628] N80-18620
FARMLANDS
Correlation of spacecraft passive microwave system data with soil moisture indices (API) --- Southern Great Plains States: Oklahoma and Kansas
[E80-10063] N80-18513

Measurement of soil moisture trends with airborne scatterometers --- Guymon, Oklahoma and Sublett, Kansas
[E80-10064] N80-18514
Plant cover, soil temperature, freeze, water stress, and evapotranspiration conditions --- Rio Grande Valley, Texas
[E80-10072] N80-18521
Continuation of measurement of hydrologic soil-cover complex with airborne scatterometers --- Texas
[E80-10073] N80-18522
Dryland pasture and crop conditons as seen by HCMM --- Colby, Kansas and the Washita River watershed near Chickasha, Oklahoma
[E80-10074] N80-18523
The easy remote sensing problem
[REPT-20] N80-18528

FATIGUE (MATERIALS)
Some aspects of fatigue crack closure in titanium alloys
[AD-A076948] N80-18164
Specification for the installation of electrical resistance strain gauges on strain pairs counter aircraft --- to monitor fatigue damage
[AD-A071363] N80-18369
Fracture mechanics in Japan
[ICAF-1123] N80-18430
Action of plastic deformations in the mechanical damage suffered by the surface of structures
[ICAF-1114] N80-18435
Repeated plastic deformation as a cause of mechanical surface damage in fatigue, wear, fretting-fatigue, and rolling fatigue: A review
[ICAF-1116] N80-18436
Fatigue behaviour of high-pressure vessels
[LBF-FB-148] N80-18441
Fatigue crack growth in lugs and the stress intensity factor
[VTH-LR-273] N80-18459

FATIGUE LIFE
Constrained fatigue life optimization of a NASVYTIS multiroller traction drive
[NASA-TM-81447] N80-18407
Estimation of the fatigue strength of welded joints based on non-destructive test results
[ICAF-1125] N80-18432
Statistical evaluation of fatigue lives at and near fatigue limit for notched specimens of steel and their life distributions --- fatigue cracks
[ICAF-1131] N80-18434
A reliability analysis approach to fatigue life dispersion of laminated glass fiber composite materials
[ICAF-1127] N80-18437
Fatigue behavior of nodular iron under combined static and dynamic multiaxial stresses
[LBF-FB-149] N80-18442
Fatigue Measuring Gauges (FMG): A new system for monitoring fatigue loads N80-18443
A review of Australian investigations on aeronautical fatigue during the period April 1977 to March 1979 --- structural strain and fatigue life studies on aircraft structures and construction materials
[AD-A071641] N80-18449
A Stress-Strain-Time model (SST) for high-temperature, low-cycle fatigue
[AD-A078829] N80-18454

FATIGUE TESTS
Application of composite materials to turbofan engine fan exit guide vanes
[NASA-TM-81432] N80-18106
Fatigue crack growth of A508 steel in high-temperature, pressurized reactor-grade water
[AD-A075506] N80-18159
Endurance and failure characteristics of modified Vasco X-2, CBS 600 and AISI 9310 spur gears --- aircraft construction materials
[NASA-TM-81421] N80-18405
Fatigue Measuring Gauges (FMG): A new system for monitoring fatigue loads N80-18443
HLH rotor box beam fatique test
[AD-A076931] N80-18450

FEED SYSTEMS
Method of producing silicon --- gas phase reactor multiple injector liquid feed system
[NASA-CASE-NPO-14382-1] N80-18231

FEEDBACK
Feedback system design
[AD-A078486] N80-18777

FEEDBACK CONTROL
A method for the transient stability enhancement of a power system using feedback control of a synchronous generator N80-18290
A microcomputer control system for the Urbana sodium lidar
[UILU-ENG-79-2507] N80-18378
The human body temperature regulation system --- closed control loop
[RAE-LIB-TRANS-2019] N80-18702
Robustness results in LQG based multivariable control designs
[LIDS-P-976] N80-18769

FERROELECTRICITY
Nonlinear ultrasonic parametric processes in piezoelectric semiconductors and ferroelectric insulators N80-18957

FERROMAGNETIC MATERIALS
Magnetic properties of amorphous Heisenberg ferromagnet with random anisotropy
[INPR-1641-RPE/097-REV] N80-18877

FERROMAGNETISM
Magnetic properties of amorphous Heisenberg ferromagnet with random anisotropy
[INPR-1641-RPE/097-REV] N80-18877

FIBER COMPOSITES
Application of composite materials to turbofan engine fan exit guide vanes
[NASA-TM-81432] N80-18106
Carbon and graphite. Part 1: Carbon and graphite fibers and fiber composites, volume 4. A bibliography with abstracts
[PB80-802366] N80-18145

FIBER OPTICS
Fiber optic sensors for measuring angular position and rotational speed --- air breathing engines
[NASA-TM-81454] N80-18368
Bidirectional coupler for full duplex transmission on a single fiber
[AD-A075467] N80-18925
Development of high strength optical fiber waveguides using residual surface compression
[AD-A078296] N80-18926
A review of fiber optics communications
[FOA-C-30173-E2] N80-18928

FIBER ORIENTATION
Influence of the orientation and the crossing of fibers on the rupturing of notched carbon fiber/epoxy composite materials
[PV-38.022] N80-18114

FIBER STRENGTH
Development of high strength optical fiber waveguides using residual surface compression
[AD-A078296] N80-18926

FIELD EFFECT TRANSISTORS
The effect of nonuniform channel doping on high frequency JFET and MESFET devices N80-18294
Optical-microwave interactions in semiconductor devices
[AD-A078538] N80-18310
Research on InGaAs FET's
[AD-A078816] N80-18976

FIELD THEORY (ALGEBRA)
The class number of an algebraic number field: its interpretation and use N80-18797
Probabilistic algorthms in finite fields
[AD-A078416] N80-18817

FIELD THEORY (PHYSICS)
Field electron and ion source research for high density information storage system
[AD-A078520] N80-18975

FILE MAINTENANCE (COMPUTERS)
Automated air information production system, phase 1. Volume 3: Air facilities subsystem
[AD-A076106] N80-18732
A methodology for free format systems design N80-18747

FILLERS
The effect of particle shape of model filler on the reinforcement of elastomeric vulcanizates N80-18173

FILM THICKNESS
Some limitations in applying classical EHD film-thickness formulae to a high-speed bearing
[NASA-TM-81431] N80-18409

FINITE DIFFERENCE THEORY
Study of three-dimensional internal flow problems related to turbomachinery flows
[AD-A078376] N80-18344
Comparison of several finite difference schemes for time marching methods as applied to one dimensional nozzle flow
[VKI-TN-132] N80-18353
A numerical approach to elastic-plastic plain-strain problems of thick-walled cylinders
[AD-A078365] N80-18455
Problem in stability analysis of finite difference schemes for hyperbolic systems
[AD-A078853] N80-18839

FINITE ELEMENT METHOD
Solution of a few nonlinear problems in aerodynamics by the finite elements and functional least squares methods --- mathematical models of transonic flow using nonlinear equations
[NASA-TM-75732] N80-17990
Application of numerical solutions to non-linear problems of fluid mechanics obtained by the method of least squares and the finite element method to unsteady Navier-Stokes equations
[NASA-TM-75727] N80-18339
Finite element analysis of a statically loaded ISO tactical shelter
[AD-A075807] N80-18451
A model of an elastic Earth by a finite element method applied to spherical shells
[SER-C/DISS-249-MITT-149] N80-18461

FINS
Advanced manufacturing development of a composite empennage component for I-1011 aircraft
[NASA-CR-162862] N80-18104

FIRES
Fire test method for graphite fiber reinforced plastics
[NASA-TM-81436] N80-18107
The potential for damage from the accidental release of conductive carbon fibers from burning composites
[NASA-TM-80213] N80-18108
The fire environment of a solid rocket propellant burning in air
[AD-A076941] N80-18209

FITTINGS
Flared tube attach system --- fluid flow lines
[NASA-CASE-MSC-18416-1] N80-18396

FIXED POINT ARITHMETIC
Data dependencies in relational database schemes N80-18984

FIXED POINTS (MATHEMATICS)
Stability and fixed points of point dissipative systems
[AD-A077410] N80-18876

FLAME PROPAGATION
The physical structure of turbulent flames
[AD-A070008] N80-18136
Ignition and flame propagation in sprays
[AD-A078889] N80-18140

FLAME SPRAYING
Ignition and flame propagation in sprays
[AD-A078889] N80-18140

FLAMEOUT
Flameout and acoustic damping in pulsed chemical lasers
[AD-A076124] N80-18388

FLAMES
An accurate model for sample droplet acceleration in analytical flames
[AD-A078655] N80-18131
The physical structure of turbulent flames
[AD-A070008] N80-18136

FLARED BODIES
Flared tube attach system --- fluid flow lines
[NASA-CASE-MSC-18416-1] N80-18396

FLAT PLATES
An experimental study of two-dimensional supersonic jet impingement on a flat plate
[AD-A076536] N80-17996
A study of some aspects of the mechanical behavior of cross-spring pivots and plate spring mechanisms with negative stiffness
[WTHD-116] N80-18416
Bending properties of non-homogeneous plates of isotropic and orthotropic materials
[TRITA-HFL-21] N80-18457
Solar energy design improvement: A methodology for hydronic flatplate collector systems
[AD-A076836] N80-18567
Multi-obstacle acoustic scattering --- circular and elliptical cylinders and flat plates N80-18880

FLAT SURFACES
Preliminary design of large reflectors with flat facets
[NASA-TM-80164] N80-18301
FLEXIBILITY
A study of flexible pavement crack dynamics and sealants N80-18242
FLIGHT CHARACTERISTICS
Flight performance of the TCV B-737 airplane at Jorge Newberry Airport, Buenos Aires, Argentina using TRSB/MLS guidance
[NASA-TM-80223] N80-18021
FLIGHT CONTROL
V/STOLAND avionics system flight-test data on a UH-1H helicopter
[NASA-TM-78591] N80-18047
The analysis of delays in simulator digital computing systems. Volume 2: Formulation of discrete state transition matrices, an alternative procedure for multirate digital computations --- flight control
[NASA-CR-152341] N80-18722
FLIGHT CREWS
Suggestions for the contents of the Aviation Board survival kit
[FOA-A-59004-H3(H9)] N80-18721
FLIGHT MECHANICS
Concepts for generating optimum vertical flight profiles
[NASA-CR-159181] N80-18031
FLIGHT SIMULATION
Automatic environmental control system for mission profile testing N80-18216
FLIGHT SIMULATORS
Computer synthesis of flight simulation visuals
[ARL/SYS-NOTE-61] N80-18053
FLIGHT TESTS
Wind-tunnel/flight correlation study of aerodynamic characteristics of a large flexible supersonic cruise airplane (XB-70-1). 3: A comparison between characteristics predicted from wind-tunnel measurements and those measured in flight
[NASA-TP-1516] N80-17986
Comparison of aerodynamic coefficients obtained from theoretical calculations wind tunnel tests and flight tests data reduction for the alpha jet aircraft
[NASA-TM-75237] N80-17991
Synthesis of rotor test data for real-time simulation
[NASA-CR-152311] N80-18029
FLOODS
Continuation of measurement of hydrologic soil-cover complex with airborne scatterometers --- Texas
[E80-10073] N80-18522
FLORIDA
Forest resource information system --- Baker County, Florida and Picayune, Mississippi sites; St. Regis Paper Company
[E80-10065] N80-18515
FLOW CHARACTERISTICS
Experimental study of the stability and flow characteristics of floating liquid columns confined between rotating disks
[NASA-CR-162800] N80-18337
Turbulent mixing processes in a partially mixed estuary N80-18504
FLOW DISTORTION
An experimental investigation of two large annular diffusers with swirling and distorted inflow
[NASA-TP-1628] N80-17984
FLOW DISTRIBUTION
Computer prediction of three-dimensional potential flow fields in which aircraft propellers operate: Computer program description and users manual
[NASA-CR-162816] N80-17994
An experimental study of two-dimensional supersonic jet impingement on a flat plate
[AD-A076536] N80-17996
Theoretical analysis of the flow field over a family of Ogive bodies, volume 2
[AD-A077397] N80-18000
Data report for a test program to study transonic flow fields about wing-body/pylon/store combinations. Volume 1: Tunnel empty flow survey data, wing body force/moment/surface pressure data, and pressure store force/moment/surface pressure data
[AD-A077182] N80-18001
Comparison of ablative materials in a solid rocket motor flow field
[AD-A075507] N80-18099
An experimental and theoretical study of the confined vortex with high flow rate N80-18332
Viscous flowfields induced by two- and three-dimensional lift jets in ground effect
[AD-A078782] N80-18343
FLOW EQUATIONS
Macroscopic description of multi-phase systems: A thermodynamic theory of flow in porous media N80-18333
FLOW GEOMETRY
Formations and transformations of a liquid stream flowing in air from polygonally shaped nozzles
[MPIS-28/1978] N80-18347
FLOW REGULATORS
Automatic thermal switch --- Space Shuttle equipment bay temperature control
[NASA-CASE-GSC-12415-1] N80-18338
FLOW STABILITY
On the evolution, persistance, instability, regeneration and disapperance of vortex rings
[MPIS-17/1978] N80-18350
FLOW VELOCITY
Computer prediction of three-dimensional potential flow fields in which aircraft propellers operate: Computer program description and users manual
[NASA-CR-162816] N80-17994
The influence of a high pressure gradient on unsteady velocity perturbations in the case of a turbulent supersonic flow
[AAAF-NT-79-10] N80-18348
FLOW VISUALIZATION
Full scale visualization of the wing tip vortices generated by a typical agricultural aircraft
[NASA-CR-162796] N80-17992
Resonant Doppler velocimeter --- velocity, temperature, and pressure measurement
[NASA-CR-162815] N80-18341
FLUID DYNAMICS
European scientific notes, volume 33, no.7 --- airships, electric batteries, oceanography and fluid dynamics
[AD-A075097] N80-19019
FLUID JETS
Formations and transformations of a liquid stream flowing in air from polygonally shaped nozzles
[MPIS-28/1978] N80-18347
FLUID MECHANICS
Laminar free convective heat transfer in the supercritical region with variable fluid properties N80-18330
Experimental study of the stability and flow characteristics of floating liquid columns confined between rotating disks
[NASA-CR-162800] N80-18337
FLUORESCENCE
Several applications of nondispersive continuum source atomic fluorescence spectrometry --- volatile metal hydrides N80-18123
A fluorescent radiation converter
[NASA-CASE-GSC-12528-1] N80-18261
Tests of laser induced fluorescence from algae at sea
[FOA-C-30171-E1] N80-18678
FLUORO COMPOUNDS
Fluoroalkyl siloxanes as liquid-repellent fabric finishes. Part 2: The homopolymers and their copolymers with alkyl silanes
[AD-A073150] N80-18185
FLUOROPOLYMERS
Fluoroalkyl siloxanes as liquid-repellent fabric finishes. Part 1: A state-of-the-art review and synthesis of the monomers
[AD-A073149] N80-18184
FLUTTER ANALYSIS
Flutter analysis of small windturbine, designed for manufacture and use in developing countries
[UTH-LR-272] N80-18415
FLYWHEELS
Study of advanced electric propulsion system concept using a flywheel for electric vehicles
[NASA-CR-159650] N80-18991
FOKKER-PLANCK EQUATION
The Boltzmann and the Fokker-Planck equations
[INPE-1606-RPE/082-REV] N80-18810
FOLDING STRUCTURES
Technology for large space systems. A special bibliography with indexes, supplement 2
[NASA-SP-7046(02)] N80-18056
FORCED VIBRATION
On the pulsation of a normal shock wave contained in an aerodynamic inlet
[AAAF-NT-79-17] N80-18006
FORECASTING
Soviet short-term forecasts of active region evolution and flare activity N80-18469
Forecasting of solar energetic radiation at the forecast center of the Institute of Applied Geophysics N80-18470
Forecasting ionospheric and geomagnetic conditions at the IAG forecasting center N80-18471
Spiral sunspots and solar activity forecasts N80-18474
Long-term forecasting of solar activity N80-18476
Short-term solar activity forecasting N80-18477
Forecasts of geomagnetic activities and HF radio propagation conditions made at Hiraiso/Japan N80-18478
A review of short-term flare forecasting activities at Toyokawa N80-18479
FORESTS
An investigation of the utility of LANDSAT 2 MSS data to the fire-danger rating area, and forest fuel analysis within Crater Lake National Park, Oregon N80-18500
Forest resource information system --- Baker County, Florida and Picayune, Mississippi sites; St. Regis Paper Company
[E80-10065] N80-18515
Continuation of measurement of hydrologic soil-cover complex with airborne scatterometers --- Texas
[E80-10073] N80-18522
FORMING TECHNIQUES
Utilization of superplasticity in industrial metal forming
[NRC/CNR-TT-1946] N80-18153
FOUNDATIONS
Prediction and statistical analysis of settlements of shallow foundations on sand N80-18233
FOURIER TRANSFORMATION
Programs for high-speed Fourier, Mellin and Fourier-Bessel transforms
[NASA-TM-75678] N80-18749
FFT as nested multiplication, with a twist
[AD-A077099] N80-18824
FOURIER-BESSEL TRANSFORMATIONS
Programs for high-speed Fourier, Mellin and Fourier-Bessel transforms
[NASA-TM-75678] N80-18749
FRACTOGRAPHY
Environmental effects on the mechanism of fretting fatigue in 7075-T6 aluminum N80-18147
Reaction bonded silicon nitride prepared from wet attrition-milled silicon --- fractography
[NASA-TM-81428] N80-18181
FRACTURE MECHANICS
Hydrogen-embrittlement-hydride fracture --- niobium hydrides
[AD-A076912] N80-18160
Some aspects of fatigue crack closure in titanium alloys
[AD-A076948] N80-18164
A study of flexible pavement crack dynamics and sealants N80-18242
Mixed-mode fracture analysis using a conservation integral N80-18423
Stress intensity factors in two bonded elastic layers containing cracks perpendicular to and on the interface. Part 1: Analysis
[NASA-CR-159218] N80-18428
Fracture mechanics in Japan
[ICAF-1123] N80-18430
Fatigue behaviour of high-pressure vessels
[LBF-FB-148] N80-18441
Science of fracture
[AD-A077564] N80-18453
Fracture mechanics study of fresh water ice
[TRITA-HFL-0021] N80-18458
FRACTURE STRENGTH
Influence of the orientation and the crossing of fibers on the rupturing of notched carbon fiber/epoxy composite materials
[PV-38.022] N80-18114
Fracture toughness of fatigue-damaged steel specimens
[MRL-R-749] N80-18154

Variation in the mechanical properties and in the fracture strength of an aluminum 7075 T651 plate, measured in the direction of thickness
[VTH-LR-271] N80-18166
Microstructurally developed toughening mechanisms in ceramics: Transformation toughening in the Al2O3/ZrO2 composite system
[AD-A076439] N80-18192
Estimation of the fatigue strength of welded joints based on non-destructive test results
[ICAF-1125] N80-18432

FRACTURES (MATERIALS)
Science of fracture
[AD-A077564] N80-18453

FRACTURING
Science of fracture
[AD-A077564] N80-18453

FRAMES
Response of ten story, reinforced concrete model frames to simulated earthquakes N80-18240
Cost minimization calculations for plane and three dimensional frame structures
[ILR-39] N80-18247
Laser measuring system for incremental assemblies --- measuring wire-wrapped frame assemblies in spark chambers
[NASA-CASE-GSC-12321-1] N80-18380

FREE CONVECTION
Laminar free convective heat transfer in the supercritical region with variable fluid properties N80-18330

FREE ELECTRONS
The non-linear theory of free electron lasers and efficiency enhancement
[AD-A075063] N80-18384

FREE FLOW
Dynamic stall on oscillating airfoils in oscillating free-streams N80-17983

FREEZING
Plant cover, soil temperature, freeze, water stress, and evapotranspiration conditions --- Rio Grande Valley, Texas
[E80-10072] N80-18521

FREQUENCY DISTRIBUTION
Frequency distributions of the wind velocity and the wind energy of the lightships Terschellingerbank, Texel, Goeree and Noordhinder
[KNMI-V-309] N80-18650

FREQUENCY MODULATION
FM transmission of television from rockets and balloons
[AD-A075489] N80-18258

FREQUENCY RANGES
The reciprocity calibration of vibration standards over an extended frequency range N80-18224

FREQUENCY SCANNING
Frequency-scanning particle size spectrometer
[NASA-CASE-NPO-13606-2] N80-18364

FREQUENCY STABILITY
Stability and frequency response of hydro-mechanical shakers in vibration rigs N80-18218

FREQUENCY SYNTHESIZERS
Frequency synthesizers. Citations from the NTIS data base
[PB80-801905] N80-18323
Frequency synthesizers. Citations from the Engineering Index data base
[PB80-801913] N80-18324

FRETTING CORROSION
Environmental effects on the mechanism of fretting fatigue in 7075-T6 aluminum N80-18147

FRONTS (METEOROLOGY)
Analysis methods and front structure
[KNMI-WR-79-2] N80-18657

FUEL CELLS
Catalyst surfaces for the chromous/chromic redox couple
[NASA-CASE-LEW-13148-2] N80-18557
The preparation of some novel electrolytes: Synthesis of partially fluorinated alkanesulfonic acids as potential fuel cell electrolytes
[AD-A078473] N80-18570

FUEL COMBUSTION
Combustion simulation of a dual chamber stratified charge spark ignition engine N80-18394

FUEL CONSUMPTION
Implications of fuel-efficient vehicles on ride quality and passenger acceptance: Workshop proceedings
[NASA-CP-2096] N80-18990

FUEL CONTAMINATION
Effects of impurities in coal-derived liquids on accelerated hot corrosion of superalloys
[NASA-TM-81384] N80-18157

FUEL CORROSION
Effects of impurities in coal-derived liquids on accelerated hot corrosion of superalloys
[NASA-TM-81384] N80-18157

FUEL PRODUCTION
Experimental alcohol fuel plants
[ATF-P-5000-2] N80-18203
Alcohol fuels information directory
[ATF-P-5000-3] N80-18204

FUEL TESTS
Evaluation of JP-5 turbine fuel in the single cylinder cue 1790 diesel engine
[AD-A078666] N80-18206

FUNCTIONAL ANALYSIS
The development of normal functions N80-18808
On the estimation of functions of several variables from aggregated data
[AD-A077105] N80-18823
Calculating constraints on relational expressions
[AD-A077092] N80-18829
An implicit function theorem for group equations generated by a finite automation
[AD-A078959] N80-18835
Realization theory for multivariate Gaussian processes, 2: State space theory revisited and dynamical representations of finite dimensional
[AD-A078749] N80-18836
Mathematical techniques for nonlinear system theory
[AD-A078715] N80-18837

FUNCTIONALS
A functional approach to the statistical mechanics of fluid particles in turbulence N80-18325

FUNCTIONS (MATHEMATICS)
No period two implies convergence, or why use tangents when secants will do --- proof of Newton's iteration versus secant iterations and where the converge
[AD-A078479] N80-18815

FUSION (MELTING)
The analysis and characterization of the urethane functional group via fusion reaction gas chromatography N80-18124

FUSION WELDING
Alternative method for the evaluation of fused glass-to-metal seals
[AD-A077514] N80-18412

FUSION-FISSION HYBRID REACTORS
Steady-state and time-dependent behavior of fusion-fission hybrid systems N80-18935

G

GALILEAN SATELLITES
Control networks for the Galilean satellites, November 1979
[NASA-CR-162799] N80-18057

GALLIUM
Liquid metal slip ring --- aerospace environments
[NASA-CASE-LEW-12277-3] N80-18300

GALLIUM ARSENIDES
An X-band array antenna module with GaAs IMPATT diode amplifier. Volume 1: Text
[FOA-C-30155-E1-VOL-1] N80-18282
An X-band array antenna module with GaAs IMPATT diode amplifier. Volume 2: Figures and tables
[FOA-C-30155-E1-VOL-2] N80-18283
Semiconductor electrodes 25: The p-GaAs/heatyl viologen system. Photoelectrochemical cells and photoelectrochromic displays
[AD-A075812] N80-18965
Semiconductor electrodes 27: The p- and n-GaAs-N, N'-dimethyl-4, 4'-bipyridinium system, enhancement of hydrogen evolution on p-GaAs and stabilization of n-GaAs electrodes
[AD-A075813] N80-18966
High-energy ion implantation for multigigabit-rate GaAs integrated circuit
[AD-A076237] N80-18968

GALLIUM COMPOUNDS
Preparation and properties of ((trimethyl silyl)methyl)-gallium 3 compounds
[AD-A076123] N80-18137
Research on InGaAs FET's
[AD-A078816] N80-18976

GAME THEORY
Quality of decision versus depth of search on game trees N80-18982

GAMMA RAY SPECTRA
Induced radioactivity in recovered Skylab materials --- gamma ray spectra
[NASA-TM-78263] N80-18904

GAMMA RAY SPECTROMETERS
Compton scattering studies of metals and hydrides with 412 KeV gamma radiation
[AD-A078801] N80-18163

GAMMA RAYS
MeV gamma radiation observed by a balloon-borne Compton telescope
[MPI-PAE/EXTRATERR-151] N80-18927

GAS ANALYSIS
Applications of Coherent Anti-Stokes Raman Spectroscopy (CARS) N80-18127
Deconvolution of gas chromatographic data
[NASA-CR-3229] N80-18360

GAS CHROMATOGRAPHY
Applications of open tubular columns to the gas chromatography of volatile metal complexes N80-18122
The analysis and characterization of the urethane functional group via fusion reaction gas chromatography N80-18124
Deconvolution of gas chromatographic data
[NASA-CR-3229] N80-18360

GAS DISCHARGES
Infrared emission spectroscopy of low pressure gaseous discharges, II
[AD-A078796] N80-18130

GAS DYNAMICS
Hydrodynamic calculations of interstellar cloud collisions N80-19005

GAS EXPLOSIONS
Model for the front propagation in a detonating gas
[FOA-C-20323-D6(D8)] N80-18356

GAS LASERS
Investigation of optimum laser pumping
[AD-A078974] N80-18390

GAS MIXTURES
High pressure laser plasma studies --- energy pathways in He-Ar gas mixtures at low pressure
[NASA-CR-162824] N80-18945

GAS PRESSURE
Pressure limiting propellant actuating system
[NASA-CASE-MSC-18179-1] N80-18097
Collective ion acceleration controlled by a gas gradient N80-18890

GAS TURBINE ENGINES
Study of research and development requirements of small gas-turbine combustors
[NASA-CR-159796] N80-18040
Proceedings of the 7th Ann. Tri-Service Meeting for Aircraft Engine Monitoring and Diagnostics --- conferences
[AD-A076126] N80-18045

GAS TURBINES
Internal coating of air cooled gas turbine blades
[NASA-CR-159701] N80-18041
Ultrasonic detection of surface flaws in gas turbine ceramics
[AD-A076023] N80-18191
Study of three-dimensional internal flow problems related to turbomachinery flows
[AD-A078376] N80-18344

GAS-ION INTERACTIONS
Broad beam ion source operation with four common gases
[NASA-CR-162801] N80-18913

GASKETS
Seals and gaskets. A bibliography with abstracts
[PB80-802010] N80-18417

GASOLINE
Photochemical conversion of coal to gasoline in an entrained bed reactor N80-18202
Laboratory investigation of the performance of a Holden engine operating on liquified petroleum gas
[AD-A076145] N80-18411

GEAR TEETH
Analytical and experimental spur gear tooth temperature as affected by operating variables
[NASA-TM-81419] N80-18403

GEARS
Endurance and failure characteristics of modified Vasco X-2, CBS 600 and AISI 9310 spur gears --- aircraft construction materials
[NASA-TM-81421] N80-18405
Effect of geometry and operating conditions on spur gear system power loss
[NASA-TM-81426] N80-18406
GENERAL AVIATION AIRCRAFT
A consideration of general aviation in the United Kingdom
[TT-7902] N80-17982
General aviation airplane structural crashworthiness programmer's manual
[AD-A075737] N80-18008
Study of research and development requirements of small gas-turbine combustors
[NASA-CR-159796] N80-18040
GEOCHEMISTRY
Symposium on Dissertations on Chemical Oceanography
[AD-A078526] N80-18676
GEOLOGICAL SURVEYS
The utilization of radar images in the geological mapping of pre-cambrian region: A proposed model
[INPE-1578-RPE/075] N80-18533
GEOMAGNETISM
Solar-Terrestrial Predictions Proceedings. Volume 1: Prediction group reports
[NASA-CR-162794] N80-18462
A method of predictions geomagnetic activity based on a coronal model of relations between solar and geomagnetic activities N80-18466
KAZIA: A computer system for solar-terrestrial data processing and objective prediction N80-18467
Forecasting of solar energetic radiation at the forecast center of the Institute of Applied Geophysics N80-18470
Forecasting ionospheric and geomagnetic conditions at the IAG forecasting center N80-18471
Forecasts of geomagnetic activity by Ottawa Magnetic Observatory: Their reliabilty and application N80-18494
GEOPHYSICS
A simplified indexing of F-region geophysical noise at low latitudes N80-18473
A disturbance forecaster's view of the September 1977 events N80-18483
Geophysical forecasting at AFGWC --- aerospace environments N80-18490
GEOS 2 SATELLITE
GEOS-2: Report on the first six months of routine operations N80-18077
GEOS 3 SATELLITE
Study of oceanic lithosphere using GEOS-3 radar altimeter data
[AD-A077344] N80-18673
GEOTHERMAL ENERGY CONVERSION
Analysis of the geothermal binary cycle using paraffin hydrocarbons as working fluids N80-18553
GEOTHERMAL RESOURCES
Geothermal energy development in the eastern United States. Evaluation of potential geothermal resource areas
[PB-299925/8] N80-18547
GIMBALS
Gimbal pickoff technological studies
[AD-A076372] N80-18370
GLACIERS
Mass balance and aspects of the glacier environment, Front Range, Colorado, 1969-1973 N80-18501
GLANDS (SEALS)
Circumferential shaft seal
[NASA-CASE-LEW-12119-2] N80-18401
GLASS
Alternative method for the evaluation of fused glass-to-metal seals
[AD-A077514] N80-18412
GLASS FIBER REINFORCED PLASTICS
Development and test of low-impact resistant towers
[AD-A077160] N80-18052
Application of composite materials to turbofan engine fan exit guide vanes
[NASA-TM-81432] N80-18106
Acoustic fatigue strength of FRP panels N80-18177
Study and torsion testing of composite materials in the form of bars having rectangular cross-sections
[RR-094] N80-18200
GLASS FIBERS
A reliability analysis approach to fatigue life dispersion of laminated glass fiber composite materials
[ICAF-1127] N80-18437
GLOBAL POSITIONING SYSTEM
A navigation algorithm for single channel low-cost GPS receiver N80-18016
Continued study of NAVSTAR/GPS for general aviation
[NASA-CR-159145] N80-18020
Global Positioning Systems (GPS). Manpack/Vehicular User Equipment (MVUE). Volume 2: Set description
[AD-A076483] N80-18022
Global Positioning System (GPS). Manpack/Vehicular User Equipment (MVUE). Volume 3: Set description
[AD-A076484] N80-18023
GPS and EAR/GEANS software support
[AD-A078607] N80-18025
Shuttle Global Positioning (GPS) System design study
[NASA-CR-160539] N80-18090
GOLD
Stopping power measurement in the 20-150 KeV region using thick target back-scattering: 1H and 4He on carbon, silicon and gold N80-18900
GRAINS (FOOD)
Development of LANDSAT-based technology for crop inventories
[E80-10054] N80-18506
Devleopment of LANDSAT-based technology for crop inventories: Appendices
[E80-10055] N80-18507
AgRISTARS: A joint program for agriculture and resources inventory surveys through aerospace remote sensing. Development and evaluation of clustering procedures --- large area crop inventories
[E80-10079] N80-18526
GRAPH THEORY
Topics in computational complexity --- graph theory N80-18748
On discrete metrics and betweenness relations --- graph theory N80-18799
The effects of selected graphic design variables on the readability of multiple-line graphs N80-18850
GRAPHITE
Application of a graphite furnace atomic absorption detector automatically coupled to HPLC for speciation of metal-containing macromolecules
[AD-A077321] N80-18101
Carbon and graphite. Part 3. Graphite--physical, mechanical, and structural studies, volume 2. A bibliography with abstracts
[PB80-802390] N80-18142
Carbon and graphite. Part 3. Graphite--physical, mechanical, and structural studies, volume 1. A bibliography with abstracts
[PB80-802382] N80-18143
Carbon and graphite. Part 2. Carbon and graphite composites - excluding carbon fiber composites. A bibliography with abstracts
[PB80-802374] N80-18144
Carbon and graphite. Part 1: Carbon and graphite fibers and fiber composites, volume 4. A bibliography with abstracts
[PB80-802366] N80-18145
Carbon and graphite. Part 4. Graphite--chemical properties. A bibliography with abstracts
[PB80-802408] N80-18146
Stopping power measurement in the 20-150 KeV region using thick target back-scattering: 1H and 4He on carbon, silicon and gold N80-18900
GRAPHITE-EPOXY COMPOSITE MATERIALS
Application of composite materials to turbofan engine fan exit guide vanes
[NASA-TM-81432] N80-18106
Fire test method for graphite fiber reinforced plastics
[NASA-TM-81436] N80-18107
Stress analysis and buckling of J-stiffened graphite-epoxy panel
[NASA-TP-1607] N80-18427
GRAPHS (CHARTS)
Automated air information production system, phase 1. Volume 4: Charting subsystem
[AD-A076107] N80-18728
Automated air information production system, phase 1. Volume 5: Cartographic EBR system
[AD-A076108] N80-18729
Automated air information production system, phase 1. Volume 1: Executive summary
[AD-A076104] N80-18730
Automated air information production system, phase 1. Volume 2: Publishing subsystem
[AD-A076105] N80-18731
The effects of selected graphic design variables on the readability of multiple-line graphs N80-18850
GRASSLANDS
Continuation of measurement of hydrologic soil-cover complex with airborne scatterometers --- Texas
[E80-10073] N80-18522
Dryland pasture and crop conditons as seen by HCMM --- Colby, Kansas and the Washita River watershed near Chickasha, Oklahoma
[E80-10074] N80-18523
GRAVELS
Structural evaluation of recycled pavement materials, volumes 1 and 2 N80-18232
GRAVITATIONAL WAVES
Tropospheric path length fluctuation in temperate semiarid locales: Application to the gravitational wave detection experiment N80-18070
Wind and wave observations in the mesosphere using coherent-scatter radar
[UILU-ENG-79-2508] N80-18604
GREAT PLAINS CORRIDOR (NORTH AMERICA)
Correlation of spacecraft passive microwave system data with soil moisture indices (API) --- Southern Great Plains States: Oklahoma and Kansas
[E80-10063] N80-18513
GREEN FUNCTION
A nodal greens function method for multidimensional neutron diffusion calculations N80-18919
GREEN WAVE EFFECT
Development of LANDSAT-based technology for crop inventories
[E80-10054] N80-18506
Devleopment of LANDSAT-based technology for crop inventories: Appendices
[E80-10055] N80-18507
AgRISTARS: A joint program for agriculture and resources inventory surveys through aerospace remote sensing. Development and evaluation of clustering procedures --- large area crop inventories
[E80-10079] N80-18526
GROUND BASED CONTROL
Miss distance with purpose carrying control through commands from a ground station
[FOA-C-20317-E3] N80-18084
A ground based phase control system for the solar power satellite. Executive summary, volume 1, phase 3
[NASA-CR-160536] N80-18560
GROUND EFFECT (AERODYNAMICS)
Effect of sweep and aspect ratio on the longitudinal aerodynamics of a spanloader wing in- and out-of-ground effect --- conducted in Langley V/STOL wind tunnel
[NASA-TM-80199] N80-17993
Viscous flowfields induced by two- and three-dimensional lift jets in ground effect
[AD-A078782] N80-18343
GROUND EFFECT MACHINES
Research on the stability of air cushion systems
[UTIAS-238] N80-17985
GROUND STATIONS
Radio astronomy N80-18062
Estimating the angular position of a moving deep space vehicle using two rotating tracking stations N80-18064
GROUND SUPPORT EQUIPMENT
GCF-NOCC reconfiguration N80-18071
GROUND SUPPORT SYSTEMS
GCF-NOCC reconfiguration N80-18071
GROUND TRUTH
Large Area Crop Inventory Experiment (LACIE). Evaluation of three-category classification
[E80-10058] N80-18509

Large Area Crop Inventory Experiment (LACIE). LACIE transition year plan for the direct estimation of wheat from LANDSAT imagery --- North Dakota
[E80-10059] N80-18510
Large Area Crop Inventory Experiment (LACIE). Composition and assembly of a spectral-met data base for spring and winter wheat, volume 2
[E80-10076] N80-18525

GROUND WATER
Analysis of freshwater lens formation in saline aquifers N80-18502
HCMM energy budget data as a model input for assessing regions of high potential groundwater pollution --- Big Sioux River Basin, SOuth Dakota
[E80-10075] N80-18524

GROUND-AIR-GROUND COMMUNICATIONS
Comparison of measured data with IF-77 propagation model predictions
[AD-A076508] N80-18259

GROUP THEORY
Divisibility in 3-manifold groups N80-18805
Detection, estimation, and control on group manifolds
[AD-A077707] N80-18821
Multiplier representations of the two-dimensional lattice group N80-18873

GUIDANCE (MOTION)
Application of digital technology to guidance and control theory
[AD-A078815] N80-18790

GUIDE VANES
Application of composite materials to turbofan engine fan exit guide vanes
[NASA-TM-81432] N80-18106

GULF OF ALASKA
Seasat gulf of Alaska workshop report
[NASA-CR-162463] N80-18549

GUNN DIODES
Optical-microwave interactions in semiconductor devices
[AD-A078538] N80-18310

GUSTS
The gust as a coherent structure in the turbulent boundary layer
[FFA-TN-AU-1499-PT-5] N80-18007

GYROSCOPES
Gimbal pickoff technological studies
[AD-A076372] N80-18370

H

HABITABILITY
STS mission duration enhancement study: (orbiter habitability)
[NASA-CR-160535] N80-18718

HALF SPACES
Analysis of arbitrarily shaped wire antennas radiating over a lossy half-space N80-18254
Response of a circular cylindrical shell to disturbances in a half-space N80-18426

HALIDES
Necessary conditions for the homogeneous formation of a volume avalanche discharge with specific applications to rare gas-halide excimer laser discharges N80-18373

HALOCARBONS
Functional group selective high performance liquid chromatographic stationary phases N80-18117

HANDBOOKS
Handbook of vibration and noise control --- of rubber
[AD-A071485] N80-18410
Electro-optical handbook. Volume 1: Weather support for precision guided munitions
[AD-A075168] N80-18637

HARDENING (MATERIALS)
Study of the relationship of microporosity in nickel-based alloys to structural hardening with titanium and aluminum during precision casting N80-18167

HARDWARE
Orbiter subsystem hardware/software interaction analysis. Volume 8: Forward reaction control system
[NASA-TM-80959] N80-18088
Orbiter subsystem hardware/software interaction analysis. Volume 8: AFT reaction control system, part 2
[NASA-TM-80960] N80-18089

HARMONIC ANALYSIS
An example of bifurcation to homoclinic orbits
[AD-A078432] N80-18818

HARMONICS
Theory of second harmonic electron cyclotron resonance heating of Tokamak plasma
[AD-A077538] N80-18950

HAWKEYE SATELLITES
A correlation between auroral kilometric radiation and field-aligned currents
[NASA-CR-162842] N80-18611

HEARING
The effects of spectral density and stimulus intensity on the elicitation of the acoustic reflex N80-18692

HEART
Features of cholinergic cardia regulation under conditions of hypokinesia
[NASA-TM-76044] N80-18687
Effect of hypokinesia on contractile function of cardiac muscle
[NASA-TM-76061] N80-18708

HEAT ACCLIMATIZATION
Physiologic reactions during five weeks of continuous residence in an artificial humid and hot climate
[NASA-TM-75356] N80-18707

HEAT CAPACITY MAPPING MISSION
Satellite monitoring of sea surface pollution
[E80-10062] N80-18512
HCMM: Soil moisture in relation to geologic structure and lithology, northern California
[E80-10067] N80-18516
Application of HCMM data to soil moisture snow and estuarine current studies
[E80-10068] N80-18517
Applications of HCMM satellite data --- water quality, hydrology, and energy exchange of Lake Erie and Lake Ontario
[E80-10071] N80-18520
Plant cover, soil temperature, freeze, water stress, and evapotranspiration conditions --- Rio Grande Valley, Texas
[E80-10072] N80-18521
Dryland pasture and crop conditons as seen by HCMM --- Colby, Kansas and the Washita River watershed near Chickasha, Oklahoma
[E80-10074] N80-18523
HCMM energy budget data as a model input for assessing regions of high potential groundwater pollution --- Big Sioux River Basin, SOuth Dakota
[E80-10075] N80-18524

HEAT EXCHANGERS
Active heat exchange system development for latent heat thermal energy storage
[NASA-CR-159726] N80-18562

HEAT FLUX
Laser melting and subsequent solidification of a surface layer --- heat flux N80-18375

HEAT MEASUREMENT
Calorimetric studies of polymer blend systems N80-18172

HEAT OF FORMATION
Analyses of the middle latitude instabilities using a quasi-geostrophic model
[INPE-1592-RPE/079] N80-18602

HEAT RESISTANT ALLOYS
Mechanisms of recovering low cycle fatigue damage in Incoloy 901 --- heat treatment and hot isotatic pressing N80-18149
Study of the effects of gaseous environments on the hot corrosion of superalloy materials
[NASA-CR-159747] N80-18155
Effects of impurities in coal-derived liquids on accelerated hot corrosion of superalloys
[NASA-TM-81384] N80-18157

HEAT STORAGE
Phase change/heat storage materials data compilation
[AD-A076414] N80-18096
Active heat exchange system development for latent heat thermal energy storage
[NASA-CR-159726] N80-18562
Engineering evaluation of a sodium hydroxide thermal enegy storage module
[NASA-TM-81417] N80-18563

HEAT TRANSFER
The physical structure of turbulent flames
[AD-A070008] N80-18136
Heat, mass and momentum transfer through sprays --- cross flow N80-18327
Analytical and experimental investigation of the effect of dyes on solar distillation N80-18328
Thermal barrier seal
[NASA-CASE-MSC-18390-1] N80-18398
Analytical and experimental spur gear tooth temperature as affected by operating variables
[NASA-TM-81419] N80-18403
Engineering evaluation of a sodium hydroxide thermal enegy storage module
[NASA-TM-81417] N80-18563

HEAT TREATMENT
Mechanisms of recovering low cycle fatigue damage in Incoloy 901 --- heat treatment and hot isotatic pressing N80-18149

HEATING EQUIPMENT
Engineering evaluation of a sodium hydroxide thermal enegy storage module
[NASA-TM-81417] N80-18563

HEAVY IONS
Summary questionaire response 7901, October 1979 --- report on heavy ions, ionic collisions, and atomic excitations
[AD-A075951] N80-18908

HEAVY LIFT HELICOPTERS
HLH rotor box beam fatique test
[AD-A076931] N80-18450

HEAVY WATER
Multiphoton contributions to far infrared generation in optically pumped deuterium oxide N80-18377

HELICOPTER DESIGN
A hingeless rotor XV-15 design integration feasibility study. Volume 1: Engineering design studies
[NASA-CR-152310] N80-18030

HELIUM
Operation of Joule-Thompson refrigeration above the critical pressure of helium N80-18066

HELIUM IONS
Stopping power measurement in the 20-150 KeV region using thick target back-scattering: 1H and 4He on carbon, silicon and gold N80-18900

HELIUM PLASMA
High pressure laser plasma studies --- energy pathways in He-Ar gas mixtures at low pressure
[NASA-CR-162824] N80-18945

HELIUM-NEON LASERS
Laser measuring system for incremental assemblies --- measuring wire-wrapped frame assemblies in spark chambers
[NASA-CASE-GSC-12321-1] N80-18380

HEMOSTATICS
The effects of adrenalectomy and corticsteroid injection on the fibrinolytic activity of complex heparin compounds in the blood during immobilization
[NASA-TM-75985] N80-18685

HETERODYNING
Construction of a high resolution heterodyne spectrometer for measurements of in line profiles medium infrared
[MPI-PAE/EXTRATERR-156] N80-18371
Tunable diode laser heterodyne radiometer measurement of atmospheric absorption of solar radiation
[NASA-CR-162827] N80-18383

HEURISTIC METHODS
Quality of decision versus depth of search on game trees N80-18982

HEWLETT-PACKARD COMPUTERS
Computer system operating manual for the meteorological mast at Cabauw
[KNMI-V-303] N80-18648

HIGH FREQUENCIES
Propagation predictions for the HF-range by the Research Institute of the Deutsche Bundespost --- predictions based on reliable sunspot number and solar-terrestrial data N80-18465

HIGH POWER LASERS
A 30-kW CO2 mixing laser
[MRL-R-751] N80-18379
High power metallic halide laser
[NASA-CASE-NPO-14782-1] N80-18381
Theoretical studies of laser light interaction and optical and X-ray emission from dense metallic plasmas
[AD-A078684] N80-18389
The theory of optical resonators
[DRIC-TRANS-5616] N80-18392
The NRL CHMAIR code: A disturbed sea level air chemistry code
[AD-A077667] N80-18612

HIGH PRESSURE
High pressure laser plasma studies --- energy pathways in He-Ar gas mixtures at low pressure
[NASA-CR-162824] N80-18945
Structural and transport properties of simple metals under high pressure N80-18959
HIGH RESOLUTION
High contrast CRT
[AD-A076235] N80-18304
HIGH SPEED
A high speed digital autocorrelator and its application to mesospheric water vapor detection
[AD-A076018] N80-18609
Programs for high-speed Fourier, Mellin and Fourier-Bessel transforms
[NASA-TM-75678] N80-18749
HIGH STRENGTH STEELS
Fracture toughness of fatigue-damaged steel specimens
[MRL-R-749] N80-18154
Endurance and failure characteristics of modified Vasco X-2, CBS 600 and AISI 9310 spur gears --- aircraft construction materials
[NASA-TM-81421] N80-18405
HIGH TEMPERATURE
Drift tube studies of ion-molecule reactions at high and low temperatures N80-18894
High temperature EPR study of superionic conductors and strongly exchange coupled paramagnets N80-18960
HIGH TEMPERATURE ENVIRONMENTS
The fire environment of a solid rocket propellant burning in air
[AD-A076941] N80-18209
HIGH TEMPERATURE LUBRICANTS
Comparison of the weight loss and adherence of nine different polyimide films thermally aged at 315 C and 350 C in air --- high temperature lubricants
[NASA-TM-81381] N80-18183
HIGH TEMPERATURE PLASMAS
Waves in hot magnetized plasmas
[INPE-1575-RRP/072] N80-18939
Thermal conductivities and coefficients of thermal diffusion of a high-temperature plasma in a uniform magnetic field
[IPPJ-432] N80-18941
HIGH TEMPERATURE RESEARCH
A Stress-Strain-Time model (SST) for high-temperature, low-cycle fatigue
[AD-A078829] N80-18454
HIGH TEMPERATURE TESTS
Design and test of a boron - aluminum high temperature wing
[AD-A075814] N80-18034
Hardened radar component materials development study
[AD-A077805] N80-18277
HIGH VOLTAGES
Experimental results on plasma interactions with large surfaces at high voltages
[NASA-TM-81423] N80-18946
HILBERT TRANSFORMATION
Projective normalization of surfaces with a fixed Hilbert Polynomial N80-18796
HISTOGRAMS
Studies in image segmentation algorithms based on histogram clustering and relaxation N80-18741
A mathematical model of spatially localized neural systems N80-18807
HOLES (ELECTRON DEFICIENCIES)
Electron and hole photocurrent effects on IMPATT oscillators N80-18291
HOLOGRAPHY
An investigation of particle size distribution using laser holography of burning solid propellant
[AD-A078904] N80-18210
HOMOGENEITY
Testing for homogeneity of chemical composition of solid propellants by means of HPLC
[DRIC-TRANS-5685] N80-18211
HOMOGENEOUS TURBULENCE
Turbulence modeling in homogeneous flows: Determination of the rapid terms N80-18334
HOMOGENIZING
An energetic approach to homogenization problems with rapidly oscillating potentials
[AD-A077134] N80-18840
HORMONE METABOLISMS
Effect of consecutive cooling and immobilization on catecholamine metabolism in rat tissues
[NASA-TM-75962] N80-18684
HORMONES
The effects of adrenalectomy and corticsteroid injection on the fibrinolytic activity of complex heparin compounds in the blood during immobilization
[NASA-TM-75985] N80-18685
Experimental investigation of the role of thyrocalcitonin in the prophylaxis of disturbances in the water-salt and mineral metabolism during a 30-day hypokinesia
[NASA-TM-75938] N80-18704
Hormone supply of the organism in prolonged emotional stress
[NASA-TM-76046] N80-18706
HOT CORROSION
Study of the effects of gaseous environments on the hot corrosion of superalloy materials
[NASA-CR-159747] N80-18155
HOT PRESSING
Mechanisms of recovering low cycle fatigue damage in Incoloy 901 --- heat treatment and hot isotatic pressing N80-18149
HUMAN BEHAVIOR
The influence of the number of participants upon the working multiday forecasts
[KNMI-V-310] N80-18651
The power process: A synthesis theory of power N80-18715
HUMAN BEINGS
Models of human vision in digital image bandwidth compression N80-18697
HUMAN BODY
The human body temperature regulation system --- closed control loop
[RAE-LIB-TRANS-2019] N80-18702
HUMAN FACTORS ENGINEERING
NASA aviation safety reporting system
[NASA-TM-78608] N80-18010
Feasibility testing of a Body Inflatable Bladder (BIB) restraint device
[AD-A078681] N80-18013
Early flight test experience with Cockpit Displayed Traffic Information (CDTI)
[NASA-TM-80221] N80-18037
Baseline acoustic and vibration study of the Minuteman 2, Integrated Program Launch Control Center, WS-133B (IP)
[AD-A075509] N80-18082
A new anti-G value for high-performance aircraft
[AD-A076904] N80-18719
Formal methods and human factors in the design of interactive languages N80-18739
HUMAN PERFORMANCE
The effect of viewing time, time to encounter, and practice on perception of aircraft separation on a cockpit display of traffic information
[NASA-TM-81173] N80-18038
The processing resource demands of failure detection in dynamic systems
[AD-A078329] N80-18420
The influence of the number of participants upon the working multiday forecasts
[KNMI-V-310] N80-18651
Modeling requirements for network simulation of human-machine systems N80-18717
HUMAN TOLERANCES
Objective measurement of human tolerance to +G sub z acceleration stress
[NASA-TM-81166] N80-18709
Vibration injuries of the hand and arm: Their occurence and the evolution of standards and limits
[ISVR-TR-101] N80-18713
HUMIDITY
The effects of relative humidity on atmospheric aerosol extinction in the 3-5 micrometers and 8-15 micrometers spectral regions
[AD-A070159] N80-18610
HYDROCARBONS
Inelastic electron tunneling spectroscopy of UV irradiated molecules N80-18116
The carbon isotope biogeochemistry of the individual hydrocarbons in bat guano and the ecology of insectivorous bats in the region of Carlsbad, New Mexico
[NASA-TM-81164] N80-18680
HYDRODYNAMIC EQUATIONS
Hydrodynamic calculations of interstellar cloud collisions N80-19005
HYDRODYNAMICS
A mass point localized kinetic theory of fluids --- hydrodynamic kinetic theory of molecules N80-18120
Deformation and hydrodynamic interaction of two particles in a suspension N80-18336
Analysis of freshwater lens formation in saline aquifers N80-18502
HYDROGEN
High-precision mass spectrometric hydrogen isotope ratio measurements N80-18115
Anelastic studies of interstitially trapped hydrogen in niobium N80-18151
Time- and space-resolved spectroscopic studies of low-current nanosecond-duration spark discharges in 90% argon and 10% hydrogen at atmospheric pressure N80-18930
Hydrogen chemisorption and oxidation on transition metal carbides N80-18958
Semiconductor electrodes 27: The p- and n-GaAs-N, N'-dimethyl-4, 4'-bipyridinium system, enhancement of hydrogen evolution on p-GaAs and stabilization of n-GaAs electrodes
[AD-A075813] N80-18966
HYDROGEN CHLORIDES
Performance and diagnostics of lasers initiated by the reaction of NO with ClO2
[AD-A076010] N80-18385
HYDROGEN CLOUDS
Hydrodynamic calculations of interstellar cloud collisions N80-19005
The formation of late O and B stars within dense molecular clouds N80-19007
HYDROGEN EMBRITTLEMENT
Hydrogen-embrittlement-hydride fracture --- niobium hydrides
[AD-A076912] N80-18160
HYDROGEN FUELS
Hydrogen as a fuel --- automobiles
[TT-7903] N80-18212
HYDROGEN IONS
Negative ion charge transfer of the reaction of S- and O- with atomic hydrogen producing H- ions from 1500 to 10 KeV N80-18892
An intense source of negative polarized hydrogen ions N80-18897
Stopping power measurement in the 20-150 KeV region using thick target back-scattering: 1H and 4He on carbon, silicon and gold N80-18900
HYDROLOGY
Radar target for remotely sensing hydrological phenomena
[NASA-CASE-LAR-12344-1] N80-18498
Mass balance and aspects of the glacier environment, Front Range, Colorado, 1969-1973 N80-18501
Applications of HCMM satellite data --- water quality, hydrology, and energy exchange of Lake Erie and Lake Ontario
[E80-10071] N80-18520
Continuation of measurement of hydrologic soil-cover complex with airborne scatterometers --- Texas
[E80-10073] N80-18522
HCMM energy budget data as a model input for assessing regions of high potential groundwater pollution --- Big Sioux River Basin, SOuth Dakota
[E80-10075] N80-18524
HYDROLOGY MODELS
Watershed constituent loading analysis utilizing empirical hydrochemical modeling techniques N80-18503
Estimation of effective hydrologic properties of soils from observations of vegetation density --- water balance of watersheds in Clinton, Maine and Santa Paula, California
[NASA-CR-162797] N80-18534
HYDROMECHANICS
Stability and frequency response of hydro-mechanical shakers in vibration rigs N80-18218
HYGROSCOPICITY
Hygrothermal response of polymer matrix composite materials
[AD-A076623] N80-18110

HYPERBOLIC FUNCTIONS
Problem in stability analysis of finite difference schemes for hyperbolic systems
[AD-A078853] N80-18839
HYPERGOLIC ROCKET PROPELLANTS
Toxic level hypergolic vapor detection sendor development
[NASA-CR-154633] N80-18366
HYPODYNAMIA
Effect of restricted motion in high temperature on enzymatic activity of the pancreas
[NASA-TM-76063] N80-18683
Effects of gravitational stress, hypokinesia and hypodynamia on the structure of the vascular bed of the spleen
[NASA-TM-75934] N80-18711
HYPOKINESIA
Effect of restricted motion in high temperature on enzymatic activity of the pancreas
[NASA-TM-76063] N80-18683
The effects of adrenalectomy and corticsteroid injection on the fibrinolytic activity of complex heparin compounds in the blood during immobilization
[NASA-TM-75985] N80-18685
Influence of ambient temperatures on the production of restraint ulcers in the rat
[NASA-TM-76028] N80-18686
Features of cholinergic cardia regulation under conditions of hypokinesia
[NASA-TM-76044] N80-18687
Topochemical differences in the amount of RNA in the motoneurons of the spinal chord in hypoxia and hypokinesia
[NASA-TM-75994] N80-18689
Experimental investigation of the role of thyrocalcitonin in the prophylaxis of disturbances in the water-salt and mineral metabolism during a 30-day hypokinesia
[NASA-TM-75938] N80-18704
Restraint ulcers in the rat. 1: Influence on ulcer frequency of fasting and of environmental temperature associated with immobilization of varying durations
[NASA-TM-76031] N80-18705
Effect of hypokinesia on contractile function of cardiac muscle
[NASA-TM-76061] N80-18708
Effects of gravitational stress, hypokinesia and hypodynamia on the structure of the vascular bed of the spleen
[NASA-TM-75934] N80-18711
HYPOXIA
Topochemical differences in the amount of RNA in the motoneurons of the spinal chord in hypoxia and hypokinesia
[NASA-TM-75994] N80-18689
HYSTERESIS
Research on the stability of air cushion systems
[UTIAS-238] N80-17985

I

IBM 370 COMPUTER
Management procedures for controlling data storage on the IBM system 370 computer at DRCS
[AD-A076139] N80-18734
ICE
Fracture mechanics study of fresh water ice
[TRITA-HFL-0021] N80-18458
Charged dislocation in ice. 1: Existence and charge density measurement by X-ray topography
[AD-A078775] N80-18540
ICE FORMATION
Statistical methods of probable use for understanding remote sensing data --- estimating ice pressure ridge characteristics
[AD-A076908] N80-18535
ICE MAPPING
Backscatter measurements of sea ice with a helicopter-borne scatterometer
[AD-A077614] N80-18542
IGNITION
Ignition and flame propagation in sprays
[AD-A078889] N80-18140
IGNITION SYSTEMS
Internal combustion engine with electrostatic discharging fuels
[NASA-CASE-NPO-13798-2] N80-18397
ILLINOIS
Implementation of Badhwar classification of corn/soybean segments --- Illinois, Indiana, Iowa, and Missouri
[E80-10060] N80-18511
IMAGE CORRELATORS
System-design consideration for an optical correlator for the Seasat-A synthetic-aperture radar
[AD-A071358] N80-18265
IMAGE ENHANCEMENT
Infrared image enhancement obtained from meteorological satellites
[INPE-1596-RPE/081] N80-18635
IMAGE PROCESSING
Feature selection and classifier design with applications to remote sensing of mule deer
N80-18505
Development of mathematical techniques for the analysis of remote sensing data
[E80-10056] N80-18508
Satellite monitoring of sea surface pollution
[E80-10062] N80-18512
Forest resource information system --- Baker County, Florida and Picayune, Mississippi sites; St. Regis Paper Company
[E80-10065] N80-18515
AgRISTARS: A joint program for agriculture and resources inventory surveys through aerospace remote sensing. Development and evaluation of clustering procedures --- large area crop inventories
[E80-10079] N80-18526
The easy remote sensing problem
[REPT-20] N80-18528
An evaluation of conventional correlation methods when matching infrared imagery to panchromatic imagery
[AD-A076111] N80-18537
Proceedings of the Image Understanding Workshop
[AD-A077568] N80-18539
Models of human vision in digital image bandwidth compression N80-18697
A weighted line-finding algorithm
[AD-A076112] N80-18756
Applications of stochastic models for image data compression
[AD-A078781] N80-18758
Connected component labeling using quadtrees
[AD-A076130] N80-18771
Second-order statistics of texture primitives
[AD-A077390] N80-18772
Image models
[AD-A078468] N80-18820
IMAGES
Image models
[AD-A078468] N80-18820
IMAGING TECHNIQUES
Infrared image enhancement obtained from meteorological satellites
[INPE-1596-RPE/081] N80-18635
Studies in image segmentation algorithms based on histogram clustering and relaxation N80-18741
IMMOBILIZATION
Multipurpose rotating machine for immobilization and conducting studies on small laboratory animals
[NASA-TM-76049] N80-18682
IMPACT LOADS
The effects of spray entrainment on the mean wind profile and the overall load on marine structures
N80-18335
IMPACT RESISTANCE
Development and test of low-impact resistant towers
[AD-A077160] N80-18052
IMPACT TESTS
A small-scale test for fiber release from carbon composites --- pyrolysis and impact
[NASA-TM-81179] N80-18105
IMPACT TOLERANCES
Wear of homogeneous and composite materials under conditions of repeated normal and sliding impact
[AD-A078429] N80-18111
IN-FLIGHT MONITORING
Specification for the installation of electrical resistance strain gauges on strain pairs counter aircraft --- to monitor fatigue damage
[AD-A071363] N80-18369
INCANDESCENCE
Incandescent lamp life under random vibration
N80-18221
INCONEL (TRADEMARK)
Study of the relationship of microporosity in nickel-based alloys to structural hardening with titanium and aluminum during precision casting N80-18167
INDEXES (DOCUMENTATION)
Optional sampling of submartingales indexed by partially ordered sets
[AD-A077409] N80-18856
INDEXES (RATIOS)
A simplified indexing of F-region geophysical noise at low latitudes N80-18473
INDIA
Long term solar activity and ionospheric prediction services rendered by the National Physical Laboratory, New Delhi N80-18472
INDIANA
Implementation of Badhwar classification of corn/soybean segments --- Illinois, Indiana, Iowa, and Missouri
[E80-10060] N80-18511
INDIUM ANTIMONIDES
InSb charge coupled infrared imaging device: The 20 element linear imager
[NASA-CR-3235] N80-18361
INDIUM ARSENIDES
Research on InGaAs FET's
[AD-A078816] N80-18976
INDUSTRIAL MANAGEMENT
Report on the gas supply industry
[ERG-027] N80-18579
INELASTIC SCATTERING
Extremal effects in rotationally inelastic diffraction --- scattering of molecules from vacuum cleaved magnesium oxides N80-18954
INEQUALITIES
Unified treatment of some inequalities among ratios of means
[AD-A078464] N80-18819
Analysis of variance with unequal variances
[AD-A077653] N80-18866
INERTIAL NAVIGATION
GPS and EAR/GEANS software support
[AD-A078607] N80-18025
INERTIAL PLATFORMS
Rim inertial measuring system --- to measure angular rates and linear accelerations
[NASA-CASE-LAR-12052-1] N80-18019
INFERENCE
The role of exchangeability in inference
[AD-A077378] N80-18857
INFLATABLE STRUCTURES
Feasibility testing of a Body Inflatable Bladder (BIB) restraint device
[AD-A078681] N80-18013
INFORMATION RETRIEVAL
Image selection system: Operator's procedures manual
[NASA-CR-160467] N80-18980
INFORMATION SYSTEMS
Picture Description Instructions (PDI) for the Telidon Videotex system
[CRC-TN-699-E] N80-18260
Forest resource information system --- Baker County, Florida and Picayune, Mississippi sites; St. Regis Paper Company
[E80-10065] N80-18515
Field electron and ion source research for high density information storage system
[AD-A078520] N80-18975
INFORMATION THEORY
Application of mutual amount of information for time delay estimation --- its use in the diagnosis of epilepsy
[THT-210] N80-18714
New methods for analysis of the performance of guidance and control systems
[AD-A078534] N80-18783
INFRARED DETECTORS
Investigation of the basic mechanisms of radiation effects on semiconductor devices used in electro-optical sensor applications
[AD-A076940] N80-18315
INFRARED IMAGERY
InSb charge coupled infrared imaging device: The 20 element linear imager
[NASA-CR-3235] N80-18361

Infrared image enhancement obtained from meteorological satellites
[INPE-1596-RPE/081] N80-18635

INFRARED INSTRUMENTS
Characterization of metal damage through infrared technology N80-18148

INFRARED RADIATION
Infrared emission spectroscopy of low pressure gaseous discharges, II
[AD-A078796] N80-18130
Tropospheric water vapor absorption in the infrared window regions N80-18594
Rocketborne ionospheric studies
[AD-A078799] N80-18616

INFRARED RADIOMETERS
Application of tunable diode lasers as local oscillators in an Infrared Heterodyne Radiometer (IHR)
[NASA-CR-159121] N80-18382
Tunable diode laser heterodyne radiometer measurement of atmospheric absorption of solar radiation
[NASA-CR-162827] N80-18383

INFRARED SCANNERS
Infrared scanner concept verification test report
[NASA-TM-78264] N80-18367

INFRARED SPECTROMETERS
Construction of a high resolution heterodyne spectrometer for measurements of in line profiles medium infrared
[MPI-PAE/EXTRATERR-156] N80-18371

INFRARED SPECTROSCOPY
Infrared emission spectroscopy of low pressure gaseous discharges, II
[AD-A078796] N80-18130

INFRARED TELESCOPES
Control system designs for the shuttle infrared telescope facility
[NASA-TM-81159] N80-18869
Astronomical activities, 1977 - 1978 --- Schmidt and infrared telescope observations
[ISBN-0-9025-5321-6] N80-18999

INHOMOGENEITY
Variation in the mechanical properties and in the fracture strength of an aluminum 7075 T651 plate, measured in the direction of thickness
[VTH-LR-271] N80-18168

INJECTION LASERS
Design of injection lasers for improved radiation performance
[AD-A078519] N80-18391

INJURIES
Vibration injuries of the hand and arm: Their occurence and the evolution of standards and limits
[ISVR-TR-101] N80-18713

INSOLATION
Mass balance and aspects of the glacier environment, Front Range, Colorado, 1969-1973 N80-18501

INSTRUMENT ERRORS
Systematic wind error and the standard pluviometric
[KNMI-V-317] N80-18659

INSULATION
Bonded grid development
[AD-A078631] N80-18309

INTAKE SYSTEMS
Low speed test of the aft inlet designed for a tandem fan V/STOL nacelle
[NASA-CR-159752] N80-18042
Application of coherence in fan noise studies
[NASA-TP-1630] N80-18882

INTEGERS
Documentation of a computer program for the bound-and-scan algorithm for integer linear programming
[AD-A075811] N80-18755

INTEGRAL EQUATIONS
Mixed-mode fracture analysis using a conservation integral N80-18423
Boundary integral equation solution of plane elasticity problems with high stress concentrations N80-18425
Smoothing and approximation of multivariate functions
[AD-A078640] N80-18832

INTEGRATED CIRCUITS
On-chip peripheral circuits for CCD signal processors
[AD-A076603] N80-18320
High-energy ion implantation for multigigabit-rate GaAs integrated circuit
[AD-A076237] N80-18968

INTEGRATED ENERGY SYSTEMS
Application of the second law to the analysis and design of energy systems N80-18978

INTERFACIAL TENSION
Liquid metal slip ring --- aerospace environments
[NASA-CASE-LEW-12277-3] N80-18300

INTERFEROMETRY
Studies in one beam laser speckle interferometry N80-18376

INTERMETALLICS
On the synthesis of metastable A-15 Nb3Si by ion implantation and on its superconducting transition temperature
[AD-A077396] N80-18135

INTERNAL COMBUSTION ENGINES
Internal combustion engine with electrostatic discharging fuels
[NASA-CASE-NPO-13798-2] N80-18397
Overview of a stirling engine test project
[NASA-TM-81442] N80-18564

INTERNAL FRICTION
Engineering feasibility of internal friction damping as a nondestructive evaluation technique for synthetic ropes
[AD-A078461] N80-18112
Internal friction and modulus in rocks at depth
[NASA-CR-160476] N80-18606

INTERNAL WAVES
Some basic aspects of oceanic internal waves and the sound-speed fluctuations they generate
[AD-A077537] N80-18677

INTERNATIONAL COOPERATION
Cosmos 81 US/USSR cardiovascular study: Experiment implementation plan
[NASA-TM-81178] N80-18710
International transfer of technology
[GPO-37-153] N80-18989

INTERNATIONAL RELATIONS
A preliminary study of the consequences of deep ocean mining technology transfer
[PB-300723/4] N80-18546

INTERPLANETARY MAGNETIC FIELDS
Examples of problem flares or situations in past solar-terrestrial observations N80-18493
Electric fields in the low latitude ionsphere and their relationship to magnetospheric and interplanetary phenomena N80-18597
Influence of the B sub x component of the interplanetary magnetic field on magnetopause reconnection
[INPE-1645-RPE/101-REV] N80-19009

INTERPOLATION
The use of linear prediction for the interpolation and extrapolation of missing data and data gaps prior to spectral analysis
[AD-A075515] N80-18268

INTERSTELLAR GAS
Galactic kinematics of molecular clouds N80-19003
Hydrodynamic calculations of interstellar cloud collisions N80-19005
Theoretical models of stellar formation --- the stellar evolution from interstellar gas and matter to protostars N80-19006

INTERSTELLAR MATTER
Galactic kinematics of molecular clouds N80-19003
Theoretical models of stellar formation --- the stellar evolution from interstellar gas and matter to protostars N80-19006

INTERSTITIALS
Anelastic studies of interstitially trapped hydrogen in niobium N80-18151

INTERSYMBOLIC INTERFERENCE
Contributions of optimal receiver theory to digital equalization
[ETSI-04-176] N80-18284

INTRACRANIAL PRESSURE
Induction powered biological radiosonde
[NASA-CASE-ARC-11120-1] N80-18691

INTRAOCULAR PRESSURE
Intra-ocular pressure normalization technique and equipment
[NASA-CASE-LEW-12723-1] N80-18690

INVESTMENT CASTING
Study of the relationship of microporosity in nickel-based alloys to structural hardening with titanium and aluminum during precision casting N80-18167

INVISCID FLOW
Numerical calculation of steady inviscid full potential compressible flow about wind turbine blades
[NASA-TM-81436] N80-18497

ION ACCELERATORS
Collective ion acceleration controlled by a gas gradient N80-18890

ION ATOM INTERACTIONS
Rotational-vibrational excitation in collisions of atomic ions with diatomic molecules N80-18893

ION BEAMS
An intense source of negative polarized hydrogen ions N80-18897
Broad beam ion source operation with four common gases
[NASA-CR-162801] N80-18913
Electromagnetic instabilities in a focused ion beam propagating through a Z-discharge plasma
[AD-A076154] N80-18948

ION CHARGE
Negative ion charge transfer of the reaction of S- and O- with atomic hydrogen producing H- ions from 1500 to 10 KeV N80-18892

ION CURRENTS
High-precision mass spectrometric hydrogen isotope ratio measurements N80-18115

ION DENSITY (CONCENTRATION)
A numerical investigation of the two stream instability and resonant heating of an inhomogeneous, axisymmetric, plasma column N80-18326
Study of the storm time fluxes of heavy ions
[NASA-CR-162826] N80-18605

ION IMPLANTATION
On the synthesis of metastable A-15 Nb3Si by ion implantation and on its superconducting transition temperature
[AD-A077396] N80-18135
High-energy ion implantation for multigigabit-rate GaAs integrated circuit
[AD-A076237] N80-18968

ION MOTION
The kinetics of ion motion in CaF2:Er
[AD-A077555] N80-18911

ION SOURCES
An intense source of negative polarized hydrogen ions N80-18897
Broad beam ion source operation with four common gases
[NASA-CR-162801] N80-18913
Intense relativistic electron beam investigations
[AD-A078515] N80-18920
Field electron and ion source research for high density information storage system
[AD-A078520] N80-18975

IONIC COLLISIONS
Summary questionaire response 7901, October 1979 --- report on heavy ions, ionic collisions, and atomic excitations
[AD-A075951] N80-18908

IONIC CRYSTALS
Charged dislocation in ice. 1: Existence and charge density measurement by X-ray topography
[AD-A078775] N80-18540

IONIZATION
Some applications of negative ion mass spectrometry N80-18126

IONOSPHERE
Ionospheric modeling at Air Force Global Weather Central N80-18491
Rocketborne ionospheric studies
[AD-A078799] N80-18616

IONOSPHERIC DISTURBANCES
Studies of equatorial scintillation problems
[AD-A076622] N80-18272
Forecasting ionospheric and geomagnetic conditions at the IAG forecasting center N80-18471
Long term solar activity and ionospheric prediction services rendered by the National Physical Laboratory, New Delhi N80-18472
Short-term solar activity forecasting N80-18477
Radio disturbance warning issuance system N80-18481
A disturbance forecaster's view of the September 1977 events N80-18483

The use of ionospheric indices to make real- and near-real-time forecasts of foF2 around Australia N80-18484
Prediction limits for foF2 N80-18485
A weekly ionospheric index N80-18486
Geophysical forecasting at AFGWC --- aerospace environments N80-18490
Preliminary numerical study of the outer scale size of ionospheric plasma cloud striations
[AD-A078492] N80-18618

IONOSPHERIC NOISE
A simplified indexing of F-region geophysical noise at low latitudes N80-18473

IONOSPHERIC PROPAGATION
The French short term radiopropagation predictions in the decameter band N80-18464
Propagation predictions for the HF-range by the Research Institute of the Deutsche Bundespost --- predictions based on reliable sunspot number and solar-terrestrial data N80-18465
Estimation of solar flame influence on radio circuit transmission loss N80-18468
Radio propagation prediction services in Japan N80-18480
A review of the operation of the IUWDS Regional Warning Centre at the Ionospheric Prediction Service, Sydney N80-18482
Prediction limits for foF2 N80-18485
PROPHET: An applicaton of propagation forecasting principles N80-18488

IONOSPHERIC SOUNDING
Forecasts of geomagnetic activities and HF radio propagation conditions made at Hiraiso/Japan N80-18478
Rocketborne ionospheric studies
[AD-A078799] N80-18616

IOWA
Implementation of Badhwar classification of corn/soybean segments --- Illinois, Indiana, Iowa, and Missouri
[E80-10060] N80-18511

IRON
Fatigue behavior of nodular iron under combined static and dynamic multiaxial stresses
[LBF-FB-149] N80-18442

IRON ALLOYS
Mechanisms of recovering low cycle fatigue damage in Incoloy 901 --- heat treatment and hot isotatic pressing N80-18149

ISLANDS
Satellite monitoring of sea surface pollution
[E80-10062] N80-18512

ISOMERIZATION
Isomerization and decomposition of 1,2 epoxy propane by intense CO2 laser radiation
[MPIS-18/1978] N80-18141

ISOSTATIC PRESSURE
Mechanisms of recovering low cycle fatigue damage in Incoloy 901 --- heat treatment and hot isotatic pressing N80-18149

ISOTHERMS
Heat transfer to air from a yawed isothermal cylinder N80-18331

ISOTOPES
High-precision mass spectrometric hydrogen isotope ratio measurements N80-18115

ITERATION
No period two implies convergence, or why use tangents when secants will do --- proof of Newton's iteration versus secant iterations and where the converge
[AD-A078479] N80-18815

ITERATIVE SOLUTION
Fast convergent iteration procedure for calculating the isobaric wet bulb temperature
[KNMI-V-327] N80-18666
Convergence theorems for abstract asymptotic martingales N80-18804

J

JAPAN
Forecasts of geomagnetic activities and HF radio propagation conditions made at Hiraiso/Japan N80-18478
A review of short-term flare forecasting activities at Toyokawa N80-18479
Radio propagation prediction services in Japan N80-18480

JET AIRCRAFT NOISE
Publications in acoustic and noise control from NASA Langley Research Center during 1940-1979 --- bibliographies
[NASA-TM-80211] N80-18684

JET ENGINE FUELS
Initial characterization of an Experimental Referee Broadened-Specification (ERBS) aviation turbine fuel
[NASA-TM-81440] N80-18205

JET EXHAUST
Numerical solution of a supersonic nozzle afterbody flow with jet exhaust
[AD-A076116] N80-17996

JET FLOW
Viscous flowfields induced by two- and three-dimensional lift jets in ground effect
[AD-A078782] N80-18343

JET IMPINGEMENT
An experimental study of two-dimensional supersonic jet impingement on a flat plate
[AD-A076536] N80-17996

JET THRUST
Method and apparatus for rapid thrust increases in a turbofan engine
[NASA-CASE-LEW-12971-1] N80-18039

JOINTS (JUNCTIONS)
Longitudinal joint systems in slip-formed rigid pavements. Volume 3: User's manual --- structural analysis
[AD-A078850] N80-18243

JOULE-THOMSON EFFECT
Operation of Joule-Thompson refrigeration above the critical pressure of helium N80-18086

JP-5 JET FUEL
Evaluation of JP-5 turbine fuel in the single cylinder cue 1790 diesel engine
[AD-A078666] N80-18206

JUPITER (PLANET)
Control networks for the Galilean satellites, November 1979
[NASA-CR-162799] N80-18057
Convection in rotating layers with thermal winds and application to Jupiter N80-19012

JUPITER ATMOSPHERE
Effect of precursor heating on radiating and chemically reacting viscous flow around a Jovian entry body N80-18329

K

KALMAN FILTERS
An analytic analysis of a Kalman filter and smoother
[AD-A076140] N80-18306

KANSAS
Correlation of spacecraft passive microwave system data with soil moisture indices (API) --- Southern Great Plains States: Oklahoma and Kansas
[E80-10063] N80-18513
Measurement of soil moisture trends with airborne scatterometers --- Guymon, Oklahoma and Sublett, Kansas
[E80-10064] N80-18514
Dryland pasture and crop conditons as seen by HCMM --- Colby, Kansas and the Washita River watershed near Chickasha, Oklahoma
[E80-10074] N80-18523

KERNEL FUNCTIONS
Remarks on the calculation of the kernel approximation in unsteady aerodynamics
[AAAF-NT-79-07] N80-18842

KINEMATICS
Galactic kinematics of molecular clouds N80-19003

KINETIC ENERGY
The energy budgets of a developing cyclone over the East China Sea during the 1975 Air Mass Transformation experiment --- study of potential and kinetic energy budgets N80-18627

KINETIC THEORY
A mass point localized kinetic theory of fluids --- hydrodynamic kinetic theory of molecules N80-18120

KITS
Suggestions for the contents of the Aviation Board survival kit
[FOA-A-59004-H3(H9)] N80-18721

L

L-1011 AIRCRAFT
Advanced composite aileron for L-1011 transport aircraft
[NASA-CR-162863] N80-18103
Advanced manufacturing development of a composite empennage component for l-1011 aircraft
[NASA-CR-162862] N80-18104

LAKE ERIE
Applications of HCMM satellite data --- water quality, hydrology, and energy exchange of Lake Erie and Lake Ontario
[E80-10071] N80-18520

LAKE ONTARIO
Applications of HCMM satellite data --- water quality, hydrology, and energy exchange of Lake Erie and Lake Ontario
[E80-10071] N80-18520

LAKES
Dryland pasture and crop conditons as seen by HCMM --- Colby, Kansas and the Washita River watershed near Chickasha, Oklahoma
[E80-10074] N80-18523

LAMINAR BOUNDARY LAYER
Experimental study of flow due to an isolated suction hole and a partially plugged suction slot
[NASA-CR-162808] N80-18340

LAMINAR FLOW
Study of three-dimensional internal flow problems related to turbomachinery flows
[AD-A078376] N80-18344

LAMINATES
Acoustic fatigue strength of FRP panels N80-18177
Stress intensity factors in two bonded elastic layers containing cracks perpendicular to and on the interface. Part 1: Analysis
[NASA-CR-159218] N80-18428
Stress intensity factors in two bonded elastic layers containing cracks perpendicular to and on the interface. Part 2: Solution and results
[NASA-CR-159219] N80-18429
A reliability analysis approach to fatigue life dispersion of laminated glass fiber composite materials
[ICAF-1127] N80-18437
Bending strength of vertically glued laminated beams with one to five plies
[AD-A077173] N80-18456
Bending properties of non-homogeneous plates of isotropic and orthotropic materials
[TRITA-HFL-21] N80-18457

LAND USE
Land use and climatological parameters in humid tropics
[INPE-1630-RPE/092] N80-18496
LACIE evaluation and outlook panel transcript: The LACIE Symposium
[E80-10069] N80-18518
Continuation of measurement of hydrologic soil-cover complex with airborne scatterometers --- Texas
[E80-10073] N80-18522

LANDING AIDS
Corrections for forwardly dispersed light with transmissometer (KNMI short range)
[KNMI-V-312] N80-18653

LANDSAT SATELLITES
Significant results from a project on agricultural statistics, 1975 - 1978
[INPE-1609-NTE/155] N80-18532

LARGE AREA CROP INVENTORY EXPERIMENT
Development of LANDSAT-based technology for crop inventories
[E80-10054] N80-18506
Devleopment of LANDSAT-based technology for crop inventories. Appendices
[E80-10055] N80-18507
Large Area Crop Inventory Experiment (LACIE). Evaluation of three-category classification
[E80-10058] N80-18509
Large Area Crop Inventory Experiment (LACIE). LACIE transition year plan for the direct estimation of wheat from LANDSAT imagery --- North Dakota
[E80-10059] N80-18510
LACIE evaluation and outlook panel transcript: The LACIE Symposium
[E80-10069] N80-18518

Large Area Crop Inventory Experiment (LACIE). Bibliographic addenda, technical reports, papers, and memorandums published under supporting research and technology and other research, test, and evaluation contracts for the Earth observations division
[E80-10070] N80-18519
Large Area Crop Inventory Experiment (LACIE). Composition and assembly of a spectral-met data base for spring and winter wheat, volume 2
[E80-10078] N80-18526
AgRISTARS: A joint program for agriculture and resources inventory surveys through aerospace remote sensing. Development and evaluation of clustering procedures — large area crop inventories
[E80-10079] N80-18528
The Cramer-Rao lower bound as a criteria for evaluating a large data reduction system such as LACIE
[REPT-21] N80-18529

LARGE SPACE STRUCTURES
Technology for large space systems. A special bibliography with indexes, supplement 2
[NASA-SP-7046(02)] N80-18056
Strawman payload data for science and applications space platforms
[NASA-CR-161376] N80-18075
Preliminary design of large reflectors with flat facets
[NASA-TM-80164] N80-18301
The reduced order model problem in distributed parameter systems adaptive identification and control
[NASA-CR-162807] N80-18798

LASER APPLICATIONS
An investigation of particle size distribution using laser holography of burning solid propellant
[AD-A078004] N80-18210
Application of tunable diode lasers as local oscillators in an Infrared Heterodyne Radiometer (IHR)
[NASA-CR-159121] N80-18382

LASER DOPPLER VELOCIMETERS
Helicopter remote wind sensor system description
[AD-A078153] N80-18024
Resonant Doppler velocimeter — velocity, temperature, and pressure measurement
[NASA-CR-162815] N80-18341
Remote measurements of boundary layer velocity parameters by monostatic lidar
[AD-A078676] N80-18543

LASER HEATING
Laser melting and subsequent solidification of a surface layer — heat flux N80-18375

LASER MODES
Design of injection lasers for improved radiation performance
[AD-A078519] N80-18391

LASER OUTPUTS
Necessary conditions for the homogeneous formation of a volume avalanche discharge with specific applications to rare gas-halide excimer laser discharges N80-18373
Studies in one beam laser speckle interferometry N80-18376
A 30-kW CO2 mixing laser
[MRL-R-751] N80-18379
The non-linear theory of free electron lasers and efficiency enhancement
[AD-A075063] N80-18384
Investigation of optimum laser pumping
[AD-A078974] N80-18390
H20-N2 transition rates and line shifts of water vapor
[AD-A078394] N80-18632

LASER PLASMA INTERACTIONS
Theoretical studies of laser light interaction and optical and X-ray emission from dense metallic plasmas
[AD-A078664] N80-18399

LASER PLASMAS
High pressure laser plasma studies — energy pathways in He-Ar gas mixtures at low pressure
[NASA-CR-162824] N80-18945

LASER PUMPING
Multiphoton contributions to far infrared generation in optically pumped deuterium oxide N80-18377
The non-linear theory of free electron lasers and efficiency enhancement
[AD-A075063] N80-18384
Performance and diagnostics of lasers initiated by the reaction of NO with ClO2
[AD-A078010] N80-18385
Investigation of optimum laser pumping
[AD-A078974] N80-18390
The theory of optical resonators
[DRIC-TRANS-5616] N80-18392

LASER RANGE FINDERS
Laser measuring system for incremental assemblies — measuring wire-wrapped frame assemblies in spark chambers
[NASA-CASE-GSC-12321-1] N80-18380

LASERS
Studies of transient discharges
[AD-A078884] N80-18318
Gimbal pickoff technological studies
[AD-A078072] N80-18370
Tests of laser induced fluorescence from algae at sea
[FOA-C-30171-E1] N80-18678

LATE STARS
The formation of late O and B stars within dense molecular clouds N80-19007

LATTICES (MATHEMATICS)
Multiplier representations of the two-dimensional lattice group N80-18873

LAWS
Application of the second law to the analysis and design of energy systems N80-18979

LEAD TELLURIDES
Transport and recombination properties of lead tin telluride alloys
[AD-A078807] N80-18166

LEAST SQUARES METHOD
Solution of a few nonlinear problems in aerodynamics by the finite elements and functional least squares methods — mathematical models of transonic flow using nonlinear equations
[NASA-TM-75732] N80-17990
Application of numerical solutions to non-linear problems of fluid mechanics obtained by the method of least squares and the finite element method to unsteady Navier-Stokes equations
[NASA-TM-75727] N80-18009
Jackknife, ridge and ordinary least squares estimators of regression parameters: A Monte Carlo comparison
[AD-A077724] N80-18631

LIAPUNOV FUNCTIONS
Stability from the bifurcation function
[AD-A078668] N80-18614

LIFE (DURABILITY)
Composite components on commercial aircraft
[NASA-TM-80231] N80-18109
Methodology for predicting the reflection cracking life of asphalt concrete overlays
[PB80-101710] N80-18248
Thermionic cathode life test studies
[NASA-TM-81441] N80-18302
Maximum likelihood estimation of a distribution function with monotone failure rate based on censored observations
[AD-A077439] N80-18952

LIFE CYCLE COSTS
Computer programs for estimating civil aircraft economics
[NASA-TM-80196] N80-18989

LIGANDS
Production of a molecular beam of ligand-free metal clusters N80-18901

LIGHT AMPLIFIERS
High power metallic halide laser
[NASA-CASE-NPO-14782-1] N80-18381

LIGHT SCATTERING
Studies in one beam laser speckle interferometry N80-18376
Collisional redistribution of light scattered by atomic vapors N80-18891

LIGHT TRANSMISSION
Corrections for forwardly dispersed light with transmissometer (KNMI short range)
[KNMI-V-312] N80-18803

LIGHTNING
Positions and movement of VHF lightning sources determined with microsecond resolution by interferometry N80-18595
A study of the variability of thunderstorm electrical events based on very-low-frequency electromagnetic data N80-18599
Nighttime/daytime optical survey of lightning and convective phenomena experiment (NOSL)
[NASA-TM-78261] N80-18608
Lightning tracking system evaluation
[AD-A078722] N80-18617

LIMBS (ANATOMY)
Vibration injuries of the hand and arm: Their occurence and the evolution of standards and limits
[ISVR-TR-101] N80-18713

LIMESTONE
Relationship of acoustic emission and ultrasonic velocity to deformation mechanisms and dilatancy during the ductile deformation of marble N80-18590

LINE SHAPE
Methodology for making a self-absorption correction to the simple copper-line-ratio technique used for arc-tunnel enthalpy measurements
[AD-A079986] N80-18055
A weighted line-finding algorithm
[AD-A078112] N80-18756

LINEAR PREDICTION
Evaluation and improvements to the quality and intelligibility of linear prediction voice coding N80-18255
The use of linear prediction for the interpolation and extrapolation of missing data and data gaps prior to spectral analysis
[AD-A075515] N80-18268

LINEAR PROGRAMMING
Documentation of a computer program for the bound-and-scan algorithm for integer linear programming
[AD-A075811] N80-18755
A linear programming approach to a simple linear regression problem with least absolute value criterion
[AD-A079622] N80-19833

LINEAR SYSTEMS
State estimation of linear systems driven simultaneously by Wiener and Poisson processes N80-18296
Robustness results in LQG based multivariable control designs
[LIDS-P-876] N80-18769
Optimal control problems with discrete time, linear dynamics, and convex state-control constraints
[VTT-ENT-28] N80-18791

LINEAR TRANSFORMATIONS
Distance preserving linear feature selection
[REPT-19] N80-18527

LINEARITY
Linear and almost-linear methods for the unification of first order expressions N80-18742

LIPID METABOLISM
Circadian rhythmicity in ventricular myocardial and diaphragmatic metabolism N80-19695

LIQUEFACTION
Spontaneous liquefaction in retrograde fluids under condensation shock waves
[MPIS-21/1978] N80-18351

LIQUEFIED GASES
Laboratory investigation of the performance of a Holden engine operating on liquified petroleum gas
[AD-A078145] N80-18411

LIQUID CHROMATOGRAPHY
Application of a graphite furnace atomic absorption detector automatically coupled to HPLC for speciation of metal-containing macromolecules
[AD-A077321] N80-18101
Functional group selective high performance liquid chromatographic stationary phases N80-18117
Testing for homogeneity of chemical composition of solid propellants by means of HPLC
[DRIC-TRANS-5885] N80-18211

LIQUID COOLING
Control of particulate emissions from turbine engine test cells by cooling water injection
[AD-A075947] N80-18587

LIQUID FLOW
Experimental study of the stability and flow characteristics of floating liquid columns confined between rotating disks
[NASA-CR-162800] N80-18337

LIQUID HELIUM
A study of the structure of liquid helium by X-ray scattering N80-18238

LIQUID INJECTION
Method of producing silicon — gas phase reactor multiple injector liquid feed system
[NASA-CASE-NPO-14382-1] N80-18231

LIQUID METALS
The characterization of the thermodynamics of specific and nonspecific interactions in liquid metal mixtures N80-18152
Liquid metal slip ring — aerospace environments [NASA-CASE-LEW-12277-3] N80-18300
Structural and transport properties of simple metals under high pressure N80-18959
LIQUID PROPELLANT ROCKET ENGINES
Combustion stability with baffles, absorbers and velocity sensitive combustion — liquid propellant rocket combustors [NASA-CR-162903] N80-18128
LIQUID-LIQUID INTERFACES
Analysis of freshwater lens formation in saline aquifers N80-18502
LIQUID-SOLID INTERFACES
Application of solidification theory to rapid solidification processing [AD-A076947] N80-18165
Influence of absorption on ultrasonic non-specular reflectivity — liquid-solid interfaces N80-18881
LIQUIDS
Liquid-immersible electrostatic ultrasonic transducer [NASA-CASE-LAR-12465-1] N80-18363
Computer simulation and theoretical studies of molecular liquids N80-18898
LITHIUM
Aromatic ions as anode materials for rechargeable, ambient-temperature batteries [AD-A079697] N80-18571
LITHIUM CHLORIDES
Lithium-thionyl chloride battery [AD-A077162] N80-18575
Optimization of LiAl/NaAlCl sub 4/CuCl sub 2 thermal cells [AD-A076945] N80-18577
LITHIUM SULFUR BATTERIES
Safety studies of lithium-sulfur dioxide cells [AD-A079961] N80-18569
Safety studies of lithium-sulfur dioxide cells [AD-A077277] N80-18573
Effects of pressure producing reactions in lithium-sulfur dioxide cells [AD-A077379] N80-18574
LITHOLOGY
HCMM: Soil moisture in relation to geologic structure and lithology, northern California [E80-10067] N80-18516
LITHOSPHERE
Study of oceanic lithosphere using GEOS-3 radar altimeter data [AD-A077344] N80-18673
LOAD TESTS
Bearing capacity of driven piles in sand N80-18237
LOADS (FORCES)
Calculation of attach point loads due to possible combustion instability in the space shuttle solid rocket boosters N80-18230
Analytical and experimental spur gear tooth temperature as affected by operating variables [NASA-TM-81419] N80-18403
Collapse load analysis for plates and panels N80-18424
MINITWIST: A shortened version of TWIST [LBF-TB-146] N80-18438
LOGARITHMS
Extreme points of certain convex subsets of log-convex functions [AD-A077549] N80-18822
LONG DURATION EXPOSURE FACILITY
Long Duration Exposure Emulsion Package (LDEEP) [AD-A077382] N80-18914
LONG RANGE WEATHER FORECASTING
The relation between the quality of the week long forecast and the quality of the currently used GWL forecast [KNMI-V-297] N80-18643
Results from a study of week long forecasts for 1975 - 1978 [KNMI-V-302] N80-18647
The influence of the number of participants upon the working multiday forecasts [KNMI-V-310] N80-18651
Long range weather forecasting [KNMI-V-317] N80-18658
LONGITUDINAL STABILITY
Effect of sweep and aspect ratio on the longitudinal aerodynamics of a spanloader wing in- and out-of-ground effect --- conducted in Langley V/STOL wind tunnel [NASA-TM-80199] N80-17993
LORENTZ GAS
Studies in molecular dynamics of the friction coefficient and the Lorentz gas N80-18896
LOW SPEED WIND TUNNELS
Low speed test of the aft inlet designed for a tandem fan V/STOL nacelle [NASA-CR-159752] N80-18042
LOW TEMPERATURE
Drift tube studies of ion-molecule reactions at high and low temperatures N80-18894
LUBRICATION
The role of the micro environment on the tribological behavior of materials [NASA-TM-81434] N80-18245
Analytical and experimental spur gear tooth temperature as affected by operating variables [NASA-TM-81419] N80-18403
LUGS
Fatigue crack growth in lugs and the stress intensity factor [VTH-LR-273] N80-18459
LUMINAIRES
Incandescent lamp life under random vibration N80-18221
LUMINANCE
Size and luminance discrimination in the peripheral visual field [MRL-R-760] N80-18703
LUNAR CRUST
Internal friction and modulus in rocks at depth [NASA-CR-160476] N80-18606
LUNAR TIDES
Tide forecasting accuracy [KNMI-V-320] N80-18625
An automated system for numerical forecasts of tidal heights, wind-driven seas, frontal waves and swells [KNMI-V-311] N80-18652
LUNGS
Mass transfer studies of pulmonary function N80-18700

M

MACHINE ORIENTED LANGUAGES
Symbolic execution of formal machine descriptions N80-18740
Methods of compacting microprograms --- machine translation N80-18744
MACHINE TRANSLATION
Methods of compacting microprograms --- machine translation N80-18744
MACHINING
The nature of strength controlling machining flaws in ceramics [AD-A075481] N80-18189
MAGNESIUM OXIDES
Extremal effects in rotationally inelastic diffraction --- scattering of molecules from vacuum cleaved magnesium oxides N80-18954
Bound small polaron transitions in magnesium oxide and beryllium oxide N80-18956
MAGNETIC ANOMALIES
Forecasts of geomagnetic activity by Ottawa Magnetic Observatory: Their reliabilty and application N80-18494
MAGNETIC CORES
Analytical core loss calculations for magnetic materials used in high frequency high power converter applications N80-18297
MAGNETIC DIPOLES
Lower hybrid heating associated with mode conversion on the Wisconsin octupole N80-18932
MAGNETIC DISTURBANCES
Forecasting ionospheric and geomagnetic conditions at the IAG forecasting center N80-18471
MAGNETIC EFFECTS
Influence of the B sub x component of the interplanetary magnetic field on magnetopause reconnection [INPE-1645-RPE/101-REV] N80-19009
MAGNETIC EQUATOR
Studies of equatorial scintillation problems [AD-A076622] N80-18272
MAGNETIC FIELD CONFIGURATIONS
Lower hybrid heating associated with mode conversion on the Wisconsin octupole N80-18932
Monte Carlo simulation of plasma confinement in mirror and cusp fields [IPPJ-431] N80-18943
MAGNETIC FIELDS
No-load testing of the shaped field superconductive motor [AD-A076125] N80-18308
Geomagnetic measurements at Sao Jose dos Campos [INPE-1643-RPE/099-REV] N80-18599
Implication of Z variations during a near-Moon equatorial counterelectrojet on 6 March 1967, in the Indian zone [INPE-1613-RPE/087-REV] N80-18601
A correlation between auroral kilometric radiation and field-aligned currents [NASA-CR-162842] N80-18611
Waves in hot magnetized plasmas [INPE-1575-RRP/072] N80-18939
Thermal conductivities and coefficients of thermal diffusion of a high-temperature plasma in a uniform magnetic field [IPPJ-432] N80-18941
MAGNETIC MIRRORS
Radial confinement of central cell plasma in tandem mirrors N80-18933
Monte Carlo simulation of neutral-beam injection for mirror fussion reactors N80-18934
Monte Carlo simulation of plasma confinement in mirror and cusp fields [IPPJ-431] N80-18943
MAGNETIC PERMEABILITY
Spin waves in itinerant electron spin density wave states --- and the magnetic permeability [INPE-1594-RPE/080-REV] N80-18903
MAGNETIC RECORDING
Data detection in high density digital magnetic recording N80-18727
MAGNETIC STORAGE
Data detection in high density digital magnetic recording N80-18727
MAGNETIC STORMS
Forecasts of geomagnetic activities and HF radio propagation conditions made at Hiraiso/Japan N80-18478
Examples of problem flares or situations in past solar-terrestrial observations N80-18493
Geomagnetic measurements at Sao Jose dos Campos [INPE-1643-RPE/099-REV] N80-18599
Study of the storm time fluxes of heavy ions [NASA-CR-162826] N80-18605
MAGNETIC VARIATIONS
Implication of Z variations during a near-Moon equatorial counterelectrojet on 6 March 1967, in the Indian zone [INPE-1613-RPE/087-REV] N80-18601
MAGNETICALLY TRAPPED PARTICLES
Radial confinement of central cell plasma in tandem mirrors N80-18933
Monte Carlo simulation of plasma confinement in mirror and cusp fields [IPPJ-431] N80-18943
MAGNETOHYDRODYNAMIC STABILITY
A numerical investigation of the two stream instability and resonant heating of an inhomogeneous, axisymmetric, plasma column N80-18326
Electromagnetic instabilities in a focused ion beam propagating through a Z-discharge plasma [AD-A076154] N80-18948
MAGNETOHYDRODYNAMICS
Parametric study of potential early commercial MHD power plants [NASA-CR-159633] N80-18559
Radial confinement of central cell plasma in tandem mirrors N80-18933
Theoretical analysis of the resonance cone in an inhomogeneous magnetoplasma column [IPPJ-433] N80-18942
MAGNETOPAUSE
Influence of the B sub x component of the interplanetary magnetic field on magnetopause reconnection [INPE-1645-RPE/101-REV] N80-19009

MAGNETOSPHERE
Electric fields in the low latitude ionosphere and their relationship to magnetospheric and interplanetary phenomena N80-18597
A correlation between auroral kilometric radiation and field-aligned currents
[NASA-CR-162842] N80-18611
Saturn's magnetosphere, rings, and inner satellites
[AD-A076619] N80-19013
MAGNETS
The dynamic stability of permanent-magnet step motors N80-18289
Permanent magnet and superconducting generators in airborne, high power systems --- computer program to predict weight of the generators and component systems
[AD-A078424] N80-18311
MAGNONS
Spin waves in itinerant electron spin density wave states --- and the magnetic permeability
[INPE-1594-RPE/080-REV] N80-18903
MAINE
Estimation of effective hydrologic properties of soils from observations of vegetation density --- water balance of watersheds in Clinton, Maine and Santa Paula, California
[NASA-CR-162797] N80-18534
MAINTENANCE
Asymptotic measures of system performance under alternative operating rules, 2 --- failure and repair stochastic processes
[AD-A078827] N80-18870
Asymptotic measures of system performance under alternative operating rules, 1
[AD-A078826] N80-18872
MAN MACHINE SYSTEMS
The effect of viewing time, time to encounter, and practice on perception of aircraft separation on a cockpit display of traffic information
[NASA-TM-81173] N80-18038
Field impact evaluation process on Electronic Tabular Display Subsystem (ETABS)
[AD-A078846] N80-18298
Modeling requirements for network simulation of human-machine systems N80-18717
Formal methods and human factors in the design of interactive languages N80-18739
Portability of large COBOL programmers: The cobol programmer's workbench
[AD-A076917] N80-18752
Image selection system: Operator's procedures manual
[NASA-CR-160467] N80-18986
MANAGEMENT INFORMATION SYSTEMS
Automated air information production system, phase 1. Volume 4: Charting subsystem
[AD-A076107] N80-18728
Automated air information production system, phase 1. Volume 5: Cartographic EBR system
[AD-A076108] N80-18729
Automated air information production system, phase 1. Volume 1: Executive summary
[AD-A076104] N80-18730
Automated air information production system, phase 1. Volume 2: Publishing subsystem
[AD-A076105] N80-18731
Automated air information production system, phase 1. Volume 3: Air facilities subsystem
[AD-A076106] N80-18732
MANIFOLDS (MATHEMATICS)
Manifolds with generalized boundary and differential semigroups N80-18800
Divisibility in 3-manifold groups N80-18805
Detection, estimation, and control on group manifolds
[AD-A077707] N80-18821
MANNED SPACE FLIGHT
STS mission duration enhancement study: (orbiter habitability)
[NASA-CR-160535] N80-18718
MANUFACTURING
Gimbal pickoff technological studies
[AD-A076372] N80-18370
MAPPING
The utilization of radar images in the geological mapping of pre-cambrian region: A proposed model
[INPE-1578-RPE/075] N80-18533
La Posta solar radio maps
[AD-A076376] N80-19017
MAPS
An evaluation of map design and map reading using eye movement recordings N80-18499
Automated air information production system, phase 1. Volume 5: Cartographic EBR system
[AD-A076108] N80-18729
MARINE ENVIRONMENTS
The effects of spray entrainment on the mean wind profile and the overall load on marine structures N80-18335
MARKET RESEARCH
A consideration of general aviation in the United Kingdom
[TT-7902] N80-17982
MASERS
Dielectric-loaded waveguide circulator for cryogenically cooled and cascaded maser waveguide structures
[NASA-CASE-NPO-14254-1] N80-18372
MASS BALANCE
Mass balance and aspects of the glacier environment, Front Range, Colorado, 1969-1973 N80-18501
MASS SPECTRA
Some applications of negative ion mass spectrometry N80-18126
MASS SPECTROMETERS
High-precision mass spectrometric hydrogen isotope ratio measurements N80-18115
Drift tube studies of ion-molecule reactions at high and low temperatures N80-18894
MASS SPECTROSCOPY
The application of chromatography and ancillary techniques to the characterization of shale oil/oil shale compound classes and of organometallics N80-18125
Some applications of negative ion mass spectrometry N80-18126
MASS TRANSFER
Heat, mass and momentum transfer through sprays --- cross flow N80-18327
Mass transfer studies of pulmonary function N80-18700
MATHEMATICAL LOGIC
Complementation, regularity and convergence of measures in Banach spaces generated by quantum logics N80-18793
An implicit function theorem for group equations generated by a finite automation
[AD-A078959] N80-18835
MATHEMATICAL MODELS
Solution of a few nonlinear problems in aerodynamics by the finite elements and functional least squares methods --- mathematical models of transonic flow using nonlinear equations
[NASA-TM-75732] N80-17990
Kinetic model for a purpose carrying target finding air defense missile (KINM)
[FOA-C-20315-E3] N80-18083
Plastic analysis of metal-matrix composite laminates N80-18102
A mathematical method for determining a laboratory simulation of the captive-flight vibrational environment N80-18214
Development of equivalents for electric power system transient stability analysis N80-18295
Turbulence modeling in homogeneous flows: Determination of the rapid terms N80-18334
A semi-empirical equation for the viscosity of air
[AD-A072053] N80-18342
A turbulent layers description of unsteady two dimensional flow
[AAAF-NT-79-18] N80-18349
Combustion simulation of a dual chamber stratified charge spark ignition engine N80-18394
A Stress-Strain-Time model (SST) for high-temperature, low-cycle fatigue
[AD-A078829] N80-18454
A numerical approach to elastic-plastic plain-strain problems of thick-walled cylinders
[AD-A078365] N80-18455
A model of an elastic Earth by a finite element method applied to spherical shells
[SER-C/DISS-249-MITT-149] N80-18461
Preliminary numerical study of the outer scale size of ionospheric plasma cloud striations
[AD-A078492] N80-18618
Numerical modeling of high latitude winds in the upper atmosphere N80-18629
The human body temperature regulation system --- closed control loop
[RAE-LIB-TRANS-2019] N80-18702
Applications of stochastic models for image data compression
[AD-A078781] N80-18758
The reduced order model problem in distributed parameter systems adaptive identification and control
[NASA-CR-162807] N80-18768
Numerical methods and approximation and modelling problems in stochastic control theory
[AD-A078288] N80-18789
A mathematical model of spatially localized neural systems N80-18807
Detection, estimation, and control on group manifolds
[AD-A077707] N80-18821
A hybrid method for the solution of some multi-commodity spatial equilibrium problems
[AD-A078514] N80-18871
Analysis of acoustic variations in the ocean produced by combined environmental effects --- mathematical model of variations in sound propagation due to ocean currents N80-18879
Field theoretic model of low-energy pion-nucleon elastic scattering N80-18918
Evolution of turbulence by three-dimensional numerical particle-vortex tracing
[AD-A076121] N80-18940
Crystal sites models N80-18953
MATHEMATICAL PROGRAMMING
Mathematical analysis and programming as applied to electromagnetic propagation and antenna design
[AD-A076150] N80-18266
A Newton method for the PIES energy model
[AD-A077102] N80-18825
Hogan's PIES example and Lemke's algorithm
[AD-A077103] N80-18826
Global and superlinear convergence of a class of scaled variable metric methods
[AD-A077098] N80-18827
Quasi-Newton methods for generalized equations
[AD-A077097] N80-18828
Newton's method for generalized equations
[AD-A077096] N80-18830
MATRICES (MATHEMATICS)
Recent developments in classical wave scattering - focus on the T-matrix approach
[AD-A077579] N80-18274
The analysis of delays in simulator digital computing systems. Volume 2: Formulation of discrete state transition matrices, an alternative procedure for multirate digital computations --- flight control
[NASA-CR-152341] N80-18722
Optimal disturbed microprocessor architecture using multi-phase processing to perform a vector, matrix multiplication N80-18726
MATRIX THEORY
On discrete metrics and betweenness relations --- graph theory N80-18799
Generalized inverses of matrices over local rings N80-18875
MATTER (PHYSICS)
Studies in the electronic structure of matter N80-18964
MAXIMUM LIKELIHOOD ESTIMATES
Maximum likelihood estimation in autoregressive processes with missing observation N80-18806
Convergence of the conditional distribution of the maximum likelihood estimate, given latent trait, to the asymptotic normality: Observations made through the constant information model
[AD-A077706] N80-18861
Maximum likelihood estimation of a distribution function with monotone failure rate based on censored observations
[AD-A077459] N80-18862
MEAN
Using incomplete multivariate data to simultaneously estimate the means N80-18849
MEASUREMENT
Procedures for precision measurement of fatigue-crack-growth-rate using crack-opening-displacement techniques
[AD-A077670] N80-18452
MEASURING INSTRUMENTS
Omega measurements in Stockholm
[FOA-C-20296-E3] N80-18027

A non-contracting beta backscatter gage for explosive quantity measurement N80-18225
Viscosity measuring instrument
[NASA-CASE-NPO-14501-1] N80-18357

MECHANICAL DRIVES
Evaluation of a high performance fixed-ratio traction drive
[NASA-TM-81425] N80-18404
Effect of geometry and operating conditions on spur gear system power loss
[NASA-TM-81426] N80-18406
Constrained fatigue life optimization of a NASVYTIS multiroller traction drive
[NASA-TM-81447] N80-18407
The application of reliability improvement warranty to dynamic systems
[AD-A075520] N80-18419

MECHANICAL PROPERTIES
Carbon and graphite. Part 3: Graphite--physical, mechanical, and structural studies, volume 2. A bibliography with abstracts
[PB80-802390] N80-18142
Carbon and graphite. Part 3: Graphite--physical, mechanical, and structural studies, volume 1. A bibliography with abstracts
[PB80-802382] N80-18143
Literature review on the mechanical behavior of fiber composite materials. Analysis of the state-of-the-art, volume 1
[LBF-TB-145-VOL-1] N80-18439
Literature review on the mechanical behavior of fiber composite materials. Analysis of the state-of-the-art. Volume 2: Appendix
[LBF-TB-145-VOL-2-APP] N80-18440
Bending strength of vertically glued laminated beams with one to five plies
[AD-A077173] N80-18456

MEDIA
Covariant electrodynamics in a medium N80-18895

MEDICAL EQUIPMENT
Intra-ocular pressure normalization technique and equipment
[NASA-CASE-LEW-12723-1] N80-18690

MELLIN TRANSFORMS
Programs for high-speed Fourier, Mellin and Fourier-Bessel transforms
[NASA-TM-75678] N80-18749

MELTING
Laser melting and subsequent solidification of a surface layer --- heat flux N80-18375

MERCURY (METAL)
On the future average mercury content of air, soil and river sediments in the European Economic Community and in the world's oceans
[EUR-6023] N80-18585

MESOSPHERE
Wind and wave observations in the mesosphere using coherent-scatter radar
[UILU-ENG-79-2508] N80-18604
A high speed digital autocorrelator and its application to mesospheric water vapor detection
[AD-A076018] N80-18609

METAL FATIGUE
Environmental effects on the mechanism of fretting fatigue in 7075-T6 aluminum N80-18147
Characterization of metal damage through infrared technology N80-18148
Mechanisms of recovering low cycle fatigue damage in Incoloy 901 --- heat treatment and hot isotatic pressing N80-18149
Fracture toughness of fatigue-damaged steel specimens
[MRL-R-749] N80-18154
Local residual stress near fatigue crack tip --- X-ray diffraction measurement technique
[ICAF-1129] N80-18433

METAL HALIDES
High power metallic halide laser
[NASA-CASE-NPO-14782-1] N80-18381

METAL HYDRIDES
Several applications of nondispersive continuum source atomic fluorescence spectrometry --- volatile metal hydrides N80-18123
Hydrogen-embrittlement-hydride fracture --- niobium hydrides
[AD-A076912] N80-18160

METAL MATRIX COMPOSITES
Plastic analysis of metal-matrix composite laminates N80-18102

METAL OXIDE SEMICONDUCTORS
Investigation of the basic mechanisms of radiation effects on semiconductor devices used in electro-optical sensor applications
[AD-A076940] N80-18315

METAL PLATES
Variation in the mechanical properties and in the fracture strength of an aluminum 7075 T651 plate, measured in the direction of thickness
[VTH-LR-271] N80-18168
Acoustical behavior of thick, composite, fluid-loaded plates, calculated using Timoshenko-Mindlin plate theory
[AD-A077671] N80-18888

METAL SURFACES
Thin film deposit and treatment of surfaces by electric discharges
[PUBL-349] N80-18321
Laser melting and subsequent solidification of a surface layer --- heat flux N80-18375
Electrochemical kinetics at metal and semiconductor surfaces: Role of interfacial energy barriers N80-18961

METAL VAPORS
The physics of spin-polarized atomic vapors
[AD-A078589] N80-18912

METAL WORKING
Utilization of superplasticity in industrial metal forming
[NRC/CNR-TT-1946] N80-18153

METALLIC PLASMAS
Theoretical studies of laser light interaction and optical and X-ray emission from dense metallic plasmas
[AD-A078684] N80-18389

METALS
Alternative method for the evaluation of fused glass-to-metal seals
[AD-A077514] N80-18412
Early diagenesis of trace metals in nearshore Long Island sound sediments N80-18670

METASTABLE STATE
On the synthesis of metastable A-15 Nb3Si by ion implantation and on its superconducting transition temperature
[AD-A077396] N80-18135

METEOROLOGICAL INSTRUMENTS
Meteorological measurements program during unified Navy field test program
[AD-A075459] N80-18640
Computer system operating manual for the meteorological mast at Cabauw
[KNMI-V-303] N80-18648
Software package description for instrument readings at Cabauw
[KNMI-V-306] N80-18649

METEOROLOGICAL PARAMETERS
Large Area Crop Inventory Experiment (LACIE). Composition and assembly of a spectral-met data base for spring and winter wheat, volume 2
[E80-10076] N80-18525
A high speed digital autocorrelator and its application to mesospheric water vapor detection
[AD-A076018] N80-18609
A preliminary look at AVE-SESAME 1 conducted on 10-11 April 1979
[NASA-TM-78262] N80-18636
Precipitation estimation using satellite data
[AD-A075978] N80-18639
Meteorological measurements program during unified Navy field test program
[AD-A075459] N80-18640
The relation between the quality of the week long forecast and the quality of the currently used GWL forecast
[KNMI-V-297] N80-18643
Verification of figure expectations --- for validating the accuracy of weather reports
[KNMI-V-298] N80-18644
Verification of objective forecasts based on analogies
[KNMI-V-300] N80-18645
Software package description for instrument readings at Cabauw
[KNMI-V-306] N80-18649
Variation of meteorological parameters at selected sites in the Netherlands
[KNMI-V-314] N80-18656
A subjective weather typology
[KNMI-V-319] N80-18661

METEOROLOGICAL RADAR
Wind and wave observations in the mesosphere using coherent-scatter radar
[UILU-ENG-79-2508] N80-18604

METEOROLOGICAL SATELLITES
World Weather Watch: Global Observing System - Satellite sub-system. Information on the application of meteorological satellite data in routine operations and research: Abstracts, annual summaries and bibliographies
[WMO-475-SUPPL-2] N80-18631
Infrared image enhancement obtained from meteorological satellites
[INPE-1596-RPE/081] N80-18635
Precipitation estimation using satellite data
[AD-A075978] N80-18639

METEOROLOGICAL SERVICES
Weather forecasting for the construction and building industry during the winter 1976 - 1977
[KNMI-V-296] N80-18642

METEOROLOGY
Long range weather forecasting
[KNMI-V-317] N80-18658

METHOD OF CHARACTERISTICS
Computation of synthetic seismograms by the method of characteristics --- geophysical prospecting N80-18593

METHYL COMPOUNDS
Semiconductor electrodes 27: The p- and n-GaAs-N, N'-dimethyl-4, 4'-bipyridinium system, enhancement of hydrogen evolution on p-GaAs and stabilization of n-GaAs electrodes
[AD-A075813] N80-18966

METRIC SPACE
On discrete metrics and betweenness relations --- graph theory N80-18799

MICROCOMPUTERS
A microcomputer control system for the Urbana sodium lidar
[UILU-ENG-79-2507] N80-18378

MICROELECTRONICS
Microcircuit device reliability digital failure rate data, summer 1979
[AD-A077199] N80-18313
Solid state research
[AD-A078676] N80-18972

MICROMINIATURIZED ELECTRONIC DEVICES
Microcircuit device reliability digital failure rate data, summer 1979
[AD-A077199] N80-18313

MICROPHONES
The response of an electrostatic microphone to an airflow
[RAE-LIB-TRANS-2011] N80-18883

MICROPOROSITY
Study of the relationship of microporosity in nickel-based alloys to structural hardening with titanium and aluminum during precision casting N80-18167

MICROPROCESSORS
Modular digital missile guidance
[AD-A078808] N80-18080
Test generation for microprocessors N80-18725
Optimal disturbed microprocessor architecture using multi-phase processing to perform a vector, matrix multiplication N80-18726
A microprocessor controlled PROM programmer
[AD-A073154] N80-18733
Software development, item 0005 of microprocessor-based power conditioner controller
[AD-A076118] N80-18757

MICROPROGRAMMING
Methods of compacting microprograms --- machine translation N80-18744

MICROSTRUCTURE
Microstructurally developed toughening mechanisms in ceramics: Transformation toughening in the Al2O3/ZrO2 composite system
[AD-A076439] N80-18192

MICROWAVE AMPLIFIERS
The instability boundary and growth rate contours of the gyrotron amplifier with spreads in energy and momenta
[AD-A077450] N80-18319

MICROWAVE ANTENNAS
An X-band array antenna module with Si-IMPATT diode amplifier. Volume 1: Text
[FOA-C-30154-E1-VOL-1] N80-18280
An X-band array antenna module with Si-IMPATT diode amplifier. Volume 2: Figures and tables
[FOA-C-30154-E1-VOL-2] N80-18281

An X-band array antenna module with GaAs IMPATT diode amplifier. Volume 1: Text
[FOA-C-30155-E1-VOL-1] N80-18282
An X-band array antenna module with GaAs IMPATT diode amplifier. Volume 2: Figures and tables
[FOA-C-30155-E1-VOL-2] N80-18283

MICROWAVE EMISSION
Correlation of spacecraft passive microwave system data with soil moisture indices (API) --- Southern Great Plains States: Oklahoma and Kansas
[E80-10063] N80-18513
Effect of soil texture on the microwave emission from soils
[NASA-TM-80632] N80-18530

MICROWAVE EQUIPMENT
Lossless broadband microwave switches
[AD-A076379] N80-18305

MICROWAVE SCANNING BEAM LANDING SYSTEM
Flight performance of the TCV B-737 airplane at Jorge Newberry Airport, Buenos Aires, Argentina using TRSB/MLS guidance
[NASA-TM-80223] N80-18021

MICROWAVE TRANSMISSION
High-intensity rainfall statistics for Canada
[CRC-1329-E] N80-18632

MICROWAVES
Microwave power transmission beam safety system
[NASA-CASE-NPO-14224-1] N80-18287
High-intensity rainfall statistics for Canada
[CRC-1329-E] N80-18632

MIDLATITUDE ATMOSPHERE
Analyses of the middle latitude instabilities using a quasi-geostrophic model
[INPE-1592-RPE/079] N80-18602

MILITARY HELICOPTERS
Helicopter remote wind sensor system description
[AD-A076153] N80-18024

MILITARY PSYCHOLOGY
Pilot selection using psychological methods
[FOA-C-55024-H7] N80-18716

MILLIMETER WAVES
Millimeter wave hardened antenna window materials development --- for ballistic missile defense interceptor applications
[AD-A076769] N80-18271

MINERAL EXPLORATION
Computation of synthetic seismograms by the method of characteristics --- geophysical prospecting
N80-18593

MINERAL METABOLISM
Experimental investigation of the role of thyrocalcitonin in the prophylaxis of disturbances in the water-salt and mineral metabolism during a 30-day hypokinesia
[NASA-TM-75938] N80-18704

MINERALS
Silicate minerals at pressure: Crystal structures and elasticity N80-18952

MINES (EXCAVATIONS)
Control of vibration and blast noise from surface coal mining, volume 1
[PB-299867/0] N80-18993

MINICOMPUTERS
Computer system operating manual for the meteorological mast at Cabaux
[KNMI-V-303] N80-18648

MINIMA
A study of local minima in structural design
N80-18236

MINING
A preliminary study of the consequences of deep ocean mining technology transfer
[PB-300723/4] N80-18546
Control of vibration and blast noise from surface coal mining, volume 4: Executive Report
[PB-299890/4] N80-18548

MINORITY CARRIERS
Low resistivity-high minority carrier lifetime single crystal silicon investigation
[AD-A077884] N80-18970

MINUTEMAN ICBM
Baseline acoustic and vibration study of the Minuteman 2, Integrated Program Launch Control Center, WS-133B (IP)
[AD-A075509] N80-18092
Propellant surveillance report LGM-30, A, B, F, G, stage 1, TP-H1043 AFT closure propellant --- minuteman missiles
[AD-A078776] N80-18207

MISS DISTANCE
Miss distance with purpose carrying control through commands from a ground station
[FOA-C-20317-E3] N80-18084

MISSILE CONTROL
Modular digital missile guidance
[AD-A078808] N80-18080
Miss distance with purpose carrying control through commands from a ground station
[FOA-C-20317-E3] N80-18084
Simulation of LV missile steering
[FOA-C-20316-E3] N80-18085
Radar image simulation of seasonally dependent reference scenes
[AD-A078119] N80-18536

MISSILE TRAJECTORIES
MODIFLY: A modular multi-degree-of-freedom trajectory program
[AD-A073801] N80-18079
Kinetic model for a purpose carrying target finding air defense missile (KINM)
[FOA-C-20315-E3] N80-18083
Simulation of LV missile steering
[FOA-C-20316-E3] N80-18085

MISSILE VIBRATION
A mathematical method for determining a laboratory simulation of the captive-flight vibrational environment N80-18214
Acoustics or shakers for simulation of captive flight vibration N80-18215
Automatic environmental control system for mission profile testing N80-18216
The vibration response of the PHOENIX missile in the F-14 aircraft captive-flight environment
N80-18227

MISSION PLANNING
Mission and sensor concepts for coastal and ocean monitoring using spacecraft and aircraft
[NASA-TM-80103] N80-18672

MISSISSIPPI
Forest resource information system --- Baker County, Florida and Picayune, Mississippi sites, St. Regis Paper Company
[E80-10065] N80-18515

MISSOURI
Implementation of Badhwar classification of corn/soybean segments --- Illinois, Indiana, Iowa, and Missouri
[E80-10060] N80-18511

MIXED CRYSTALS
Synthetic approaches to mixed-valence chemistry --- review of mixed valence chemical reactions and crystal growth
[AD-A078513] N80-18139

MODULES
Method of fabricating a photovoltaic module of a substantially transparent construction
[NASA-CASE-NPO-14303-1] N80-18550

MOISTURE CONTENT
An investigation of the utility of LANDSAT 2 MSS data to the fire-danger rating area, and forest fuel analysis within Crater Lake National Park, Oregon
N80-18500

MOLECULAR BEAMS
Production of a molecular beam of ligand-free metal clusters N80-18801

MOLECULAR CHAINS
A molecular thermodynamic model for aqueous solutions of nonpolar compounds and micelle formation N80-18902

MOLECULAR COLLISIONS
A crucial demonstration of strong collision behavior of vibrational energy for gas-surface collisions
[AD-A078800] N80-18910

MOLECULAR DIFFUSION
Studies in molecular dynamics of the friction coefficient and the Lorentz gas N80-18896

MOLECULAR ENERGY LEVELS
A crucial demonstration of strong collision behavior of vibrational energy for gas-surface collisions
[AD-A078800] N80-18910

MOLECULAR INTERACTIONS
Studies in molecular dynamics of the friction coefficient and the Lorentz gas N80-18896
A molecular thermodynamic model for aqueous solutions of nonpolar compounds and micelle formation N80-18902

MOLECULAR IONS
Mechanisms of multiphoton dissociation of molecular ions
[AD-A077227] N80-18906

MOLECULAR RELAXATION
A crucial demonstration of strong collision behavior of vibrational energy for gas-surface collisions
[AD-A078800] N80-18910

MOLECULAR SPECTROSCOPY
Theory of saturation spectroscopy including collisional effects
[AD-A075830] N80-18909

MOLECULAR STRUCTURE
Three studies in the electronic and vibrational structure of polyatomic molecules. 1: The thermal lensing spectrometer and the local mode model of vibrational overtone spectra. 2: Calculations of second order hyperpolarizabilities. 3: The molecular structure of the benzyl radical and its ions and a program for normal mode analysis N80-18119
The effect of electrostatic fields on reacting molecules
[AD-A077581] N80-18907

MOLECULAR THEORY
A mass point localized kinetic theory of fluids --- hydrodynamic kinetic theory of molecules
N80-18120
Computer simulation and theoretical studies of molecular liquids N80-18898

MOLECULES
Application of a graphite furnace atomic absorption detector automatically coupled to HPLC for speciation of metal-containing macromolecules
[AD-A077321] N80-18101
Computer simulation and theoretical studies of molecular liquids N80-18898
Extremal effects in rotationally inelastic diffraction --- scattering of molecules from vacuum cleaved magnesium oxides N80-18954

MOLTEN SALTS
Active heat exchange system development for latent heat thermal energy storage
[NASA-CR-159726] N80-18562

MOLYBDENUM
Electron paramagnetic resonance studies of low symmetry nickel(I) and molybdenum (V) complexes. Part 1: Computer simulation of electron paramagnetic resonance spectra. Part 2: Electron paramagnetic resonance studies of nickel(I) triphenylphosphine complexes. Part 3: Electron paramagnetic resonance studies of a molybdenum(V) thiocyanate complex
N80-18118

MOMENTUM TRANSFER
Heat, mass and momentum transfer through sprays --- cross flow N80-18327

MONOMERS
Experimental and theoretical determination of the velocity dependance of the scattering cross sections in monomer-dimer noble gas collisions
[MPIS-19/1978] N80-18915

MONOTONE FUNCTIONS
Unified treatment of some inequalities among ratios of means
[AD-A078464] N80-18819
Numerical integration of a class of sinusoidal functions whose argument is the integral of a monotonic increasing function N80-18844

MONTE CARLO METHOD
Jackknife, ridge and ordinary least squares estimators of regression parameters: A Monte Carlo comparison
[AD-A077724] N80-18831
Monte Carlo simulation of neutral-beam injection for mirror fussion reactors N80-18934
Monte Carlo simulation of plasma confinement in mirror and cusp fields
[IPPJ-431] N80-18943

MORPHOLOGY
Crystallinity, morphology, and rheology of PVC-plasticizer systems N80-18171

MOSSBAUER EFFECT
Variable temperature 119M SN Moessbauer study of organotin - substituted styrene monomers and polymers
[AD-A075958] N80-18188
Applications of the Moessbauer Effect to the study of mixed-valence compounds
[AD-A077640] N80-18967

MOTION SIMULATORS
Response of ten story, reinforced concrete model frames to simulated earthquakes N80-18240
MULTIPACTOR DISCHARGES
High power RF coaxial switch
[NASA-CASE-NPO-14229-1] N80-18285
MULTIPHASE FLOW
Macroscopic description of multi-phase systems: A thermodynamic theory of flow in porous media
N80-18333
MULTIPLEXING
Test methods for telemetry systems and subsystems. Volume 4: Test methods for data multiplex equipment
[AD-A075789] N80-18092
MULTIPLICATION
Multiplier representations of the two-dimensional lattice group N80-18873
MULTIPROCESSING (COMPUTERS)
Optimal disturbed microprocessor architecture using multi-phase processing to perform a vector, matrix multiplication N80-18726
MULTISPECTRAL BAND SCANNERS
An investigation of the utility of LANDSAT 2 MSS data to the fire-danger rating area, and forest fuel analysis within Crater Lake National Park, Oregon
N80-18500
MULTIVARIATE STATISTICAL ANALYSIS
Incomplete block designs for comparing treatments with a control. 3: Optimal design for p = 4, k = 3 and p = 5, k = 3
[AD-A078331] N80-18784
Incomplete block designs for comparing treatments with a control. 1: General theory
[AD-A078330] N80-18786
Smoothing and approximation of multivariate functions
[AD-A078640] N80-18832
Realization theory for multivariate Gaussian processes, 2: State space theory revisited and dynamical representations of finite dimensional
[AD-A078749] N80-18836
Combinatoric classification of multivariate normal observation vectors N80-18848
Using incomplete multivariate data to simultaneously estimate the means N80-18849
Optimum rules for classification into two multivariate normal populations with the same covariance matrix
[AD-A077565] N80-18854
On a conjecture concerning least favorable configurations in certain two-stage selection procedures
[AD-A077591] N80-18865
MUSCLES
Fatigue in skeletal muscle N80-18693
MUSCULAR FATIGUE
Fatigue in skeletal muscle N80-18693
MUSCULAR FUNCTION
Fatigue in skeletal muscle N80-18693
Microvascular determinants of oxygen supply in resting and contracting striated muscle N80-18694
Effect of hypokinesia on contractile function of cardiac muscle
[NASA-TM-76061] N80-18708
MUSCULAR STRENGTH
Muscular force-velocity alterations consequent to slow and fast velocity power training N80-18696
MYOCARDIUM
Circadian rhythmicity in ventricular myocardial and diaphragmatic metabolism N80-18695
Effect of hypokinesia on contractile function of cardiac muscle
[NASA-TM-76061] N80-18708

N

NASA PROGRAMS
The world of tomorrow: Aerospace activities for 8- to 10-year olds. A guide for leaders of children's groups and teachers of the lower grades
[NASA-EP-144] N80-18074
Composite components on commerical aircraft
[NASA-TM-80231] N80-18109
NASA's university program: Active projects, fiscal year 1979
[NASA-TM-81777] N80-18979
Ames Research Center publications: A continuing bibliography, 1978
[NASA-TM-81175] N80-18985
NATIONAL AIRSPACE UTILIZATION SYSTEM
Report on the task force on aircraft separation assurance, appendices --- systems analysis of collision avoidance systems integration in the air traffic control airspace utilization system
[AD-A077713] N80-18017
NATURAL GAS
Report on the gas supply industry
[ERG-027] N80-18579
NATURAL SATELLITES
Saturn's magnetosphere, rings, and inner satellites
[AD-A076619] N80-19013
NAVIER-STOKES EQUATION
Application of numerical solutions to non-linear problems of fluid mechanics obtained by the method of least squares and the finite element method to unsteady Navier-Stokes equations
[NASA-TM-75727] N80-18339
NAVIGATION AIDS
Differential Omega in the Alaska/Yukon region: An analytic assessment
[AD-A078517] N80-18018
NAVSTAR SATELLITES
Continued study of NAVSTAR/GPS for general aviation
[NASA-CR-159145] N80-18020
NEODYMIUM ALLOYS
Application of nonlinear crystals
[AD-A077570] N80-18974
NETHERLANDS
Variation of meteorological parameters at selected sites in the Netherlands
[KNMI-V-314] N80-18656
Precipitation, open water evaporation and potential precipitation surplus in the Netherlands: Frequency distributions in the growing season
[KNMI-WR-79-4] N80-18662
Correlations between the 500 mb circulation and the weather in the Netherlands
[KNMI-V-321] N80-18664
NETWORK ANALYSIS
Development of equivalents for electric power system transient stability analysis N80-18295
Design and analysis of the Distributed Double-Loop Computer Network (DDLCN) N80-18762
NETWORK SYNTHESIS
The design of deadlock- and livelock-free packet switching networks N80-18763
NEURONS
A mathematical model of spatially localized neural systems N80-18807
NEUROPHYSIOLOGY
Effect of consecutive cooling and immobilization on catecholamine metabolism in rat tissues
[NASA-TM-75962] N80-18684
The effects of stimulation of the anterior cingulate gyrus in cats with freedom of movement
[NASA-TM-76055] N80-18688
NEUTRAL BEAMS
Monte Carlo simulation of neutral-beam injection for mirror fussion reactors N80-18934
NEUTRON CROSS SECTIONS
A nodal greens function method for multidimensional neutron diffusion calculations N80-18919
NEW ENGLAND (US)
A feasibility study of windpower for the New England area
[AD-A076614] N80-18568
NEWTON THEORY
No period two implies convergence, or why use tangents when secants will do --- proof of Newton's iteration versus secant iterations and where the converge
[AD-A078479] N80-18815
NEWTON-RAPHSON METHOD
Global and superlinear convergence of a class of scaled variable metric methods
[AD-A077098] N80-18827
Quasi-Newton methods for generalized equations
[AD-A077097] N80-18828
Newton's method for generalized equations
[AD-A077096] N80-18830
NICKEL
Electron paramagnetic resonance studies of low symmetry nickel(I) and molybdenum (V) complexes. Part 1: Computer simulation of electron paramagnetic resonance spectra. Part 2: Electron paramagnetic resonance studies of nickel(I) triphenylphosphine complexes. Part 3: Electron paramagnetic resonance studies of a molybdenum(V) thiocyanate complex
N80-18118
NICKEL ALLOYS
Study of the relationship of microporosity in nickel-based alloys to structural hardening with titanium and aluminum during precision casting N80-18167
NICKEL CADMIUM BATTERIES
High rate stable nickel-cadmium batteries
[AD-A078714] N80-18572
NICKEL COATINGS
Internal coating of air cooled gas turbine blades
[NASA-CR-159701] N80-18041
NIOBIUM
Anelastic studies of interstitially trapped hydrogen in niobium N80-18151
NIOBIUM COMPOUNDS
Hydrogen-embrittlement-hydride fracture --- niobium hydrides
[AD-A076912] N80-18160
NITRIC OXIDE
Calibration of an ultraviolet polychromator for rocketborne studies of aurora
[AP-19] N80-18626
NITROGEN OXIDES
Performance and diagnostics of lasers initiated by the reaction of NO with ClO2
[AD-A076010] N80-18385
Evaluation of a photochemical system for nitrogen oxides control --- coal fired boilers N80-18583
NOAA SATELLITES
Coastal water temperatures in the southeastern portion of Brazil from oceanographic data and NOAA satellite observations, volume 1
[INPE-1569-RPE/070] N80-18671
NOCTILUCENT CLOUDS
Numerical study of particle growth and water vapor concentration in noctilucent clouds
[AP-18] N80-18663
NOISE (SOUND)
High frequency ground vibration measurement
N80-18223
Control of vibration and blast noise from surface coal mining, volume 2
[PB-299888/8] N80-18994
Research and pedagogy in noise and vibration control N80-19020
NOISE GENERATORS
Program documentation for the data noising program
[NASA-CR-160534] N80-18087
Identification of noise sources in FC centrifugal fan rotors N80-18395
NOISE REDUCTION
Handbook of vibration and noise control --- of rubber
[AD-A071485] N80-18410
Publications in acoustic and noise control from NASA Langley Research Center during 1940-1979 --- bibliographies
[NASA-TM-80211] N80-18884
NONCONSERVATIVE FORCES
Dynamic stability of columns subjected to nonconservative forces
[AD-A078920] N80-18447
NONDESTRUCTIVE TESTS
Nondestructive evaluation of airport pavements. Volume 1: Program references
[AD-A078835] N80-18051
Engineering feasibility of internal friction damping as a nondestructive evaluation technique for synthetic ropes
[AD-A078461] N80-18112
Nondestructive testing: X-ray photography and radiography, volume 2. Citations from the Engineering Index data base
[PB80-802200] N80-18421
Nondestructive testing: X-ray photography and radiography. Citations from the NTIS data base
[PB80-802192] N80-18422
Estimation of the fatigue strength of welded joints based on non-destructive test results
[ICAF-1125] N80-18432

NONLINEAR EQUATIONS
Solution of a few nonlinear problems in aerodynamics by the finite elements and functional least squares methods --- mathematical models of transonic flow using nonlinear equations
[NASA-TM-75732] N80-17990
Mathematical techniques for nonlinear system theory
[AD-A078715] N80-18837

NONLINEAR PROGRAMMING
Conjugate-gradient methods for large-scale nonlinear optimization
[AD-A078713] N80-18759
Newton's method for generalized equations
[AD-A077096] N80-18830

NONLINEAR SYSTEMS
A coherent nonlinear theory of auroral kilometric radiation
[AD-A078918] N80-18619
Controllability and accessibility in nonlinear control systems N80-18767
Control of dynamical systems
[AD-A078489] N80-18780
A functional expansion approach to the solution of nonlinear feedback problems
[AD-A077408] N80-18787
Multiple integral expansions for nonlinear filtering
[AD-A078490] N80-18816
A globally and quadratically convergent algorithm for general nonlinear programming problems
[AD-A077104] N80-18841
Relativistic nonlinear electron cyclotron waves in plasma
[INPE-1625-RPE/090] N80-18938
Explosion of strange attractors exhibited by Duffing's equation
[IPPJ-430] N80-18944
Application of nonlinear crystals
[AD-A077570] N80-18974

NONLINEARITY
Nonlinear ultrasonic parametric processes in piezoelectric semiconductors and ferroelectric insulators N80-18957

NONPARAMETRIC STATISTICS
A Bayesian nonparametric estimator of survival probability assuming increasing failure rate
[AD-A077458] N80-18863
Nonparametric regression based on the concomitants of order statistics
[AD-A077636] N80-18867

NONUNIFORM FLOW
The generation of a Tollmien-Schlichting wave by a sound wave
[AD-A075816] N80-18886

NONUNIFORM PLASMAS
A numerical investigation of the two stream instability and resonant heating of an inhomogeneous, axisymmetric, plasma column N80-18326

NORMAL DENSITY FUNCTIONS
Combinatoric classification of multivariate normal observation vectors N80-18848
Optimum rules for classification into two multivariate normal populations with the same covariance matrix
[AD-A077565] N80-18854
Convergence of the conditional distribution of the maximum likelihood estimate, given latent trait, to the asymptotic normality: Observations made through the constant information model
[AD-A077706] N80-18861

NORMAL SHOCK WAVES
On the pulsation of a normal shock wave contained in an aerodynamic inlet
[AAAF-NT-79-17] N80-18006

NORMALITY
Projective normalization of surfaces with a fixed Hilbert Polynomial N80-18796

NORTH AMERICA
Correlation of spacecraft passive microwave system data with soil moisture indices (API) --- Southern Great Plains States: Oklahoma and Kansas
[E80-10063] N80-18513
Plant cover, soil temperature, freeze, water stress, and evapotranspiration conditions --- Rio Grande Valley, Texas
[E80-10072] N80-18521

NORTH DAKOTA
Large Area Crop Inventory Experiment (LACIE). LACIE transition year plan for the direct estimation of wheat from LANDSAT imagery --- North Dakota
[E80-10059] N80-18510

NORTH SEA
Satellite monitoring of sea surface pollution
[E80-10062] N80-18512

NORTHERN HEMISPHERE
The North Pacific Oscillation and eigenvectors of Northern Hemisphere atmospheric circulation during winter N80-18591

NORWAY
Space activity in Norway, 1978
[SAD-80-T] N80-18078

NOTCH SENSITIVITY
Influence of the orientation and the crossing of fibers on the rupturing of notched carbon fiber/epoxy composite materials
[PV-38.022] N80-18114

NOTCH TESTS
Characterization of metal damage through infrared technology N80-18148

NOZZLE FLOW
Numerical solution of a supersonic nozzle afterbody flow with jet exhaust
[AD-A076116] N80-17998
Formations and transformations of a liquid stream flowing in air from polygonally shaped nozzles
[MPIS-28/1978] N80-18347

NUCLEAR EMULSIONS
Long Duration Exposure Emulsion Package (LDEEP)
[AD-A077362] N80-18914

NUCLEAR EXPLOSIONS
Resistance of reinforced concrete structures under high intensity loads --- nuclear detonations N80-18235
The sensitivity of satellite communications to the uncertainties in selected chemical reaction rate coefficients
[AD-A078924] N80-18279

NUCLEAR FUSION
Monte Carlo simulation of neutral-beam injection for mirror fussion reactors N80-18934

NUCLEAR REACTORS
Activities report on reactor physics, 1977 to 1978 N80-18712

NUCLEAR RESEARCH
Research activities in high energy physics, 1977 N80-18921
Research activities in high energy physics, 1978 --- particle theory experimentation and instrumentation N80-18922

NUCLEATION
Charged atmospheric conglomerates role of negative ions in heteromolecular nucleation the properties of small clusters and atmospheric ions
[AD-A078962] N80-18614

NUCLEONS
Field theoretic model of low-energy pion-nucleon elastic scattering N80-18918

NUMBER THEORY
The class number of an algebraic number field: its interpretation and use N80-18797

NUMERICAL ANALYSIS
Numerical solution of a supersonic nozzle afterbody flow with jet exhaust
[AD-A076116] N80-17998
Electromagnetic transmission through a filled slit of arbitrary cross section in a conducting plane of finite thickness N80-18256
A numerical investigation of the two stream instability and resonant heating of an inhomogeneous, axisymmetric, plasma column N80-18326
Comparison of several finite difference schemes for time marching methods as applied to one dimensional nozzle flow
[VKI-TN-132] N80-18353
Stress intensity factors in two bonded elastic layers containing cracks perpendicular to and on the interface. Part 2: Solution and results
[NASA-CR-159219] N80-18429
The North Pacific Oscillation and eigenvectors of Northern Hemisphere atmospheric circulation during winter N80-18591
Approximation by polynomial arcs to generate suboptical numerical solutions in control problems
[INPE-1642-RPE/098-REV] N80-18809
Theoretical analysis of the resonance cone in an inhomogeneous magnetoplasma column
[IPPJ-433] N80-18942

NUMERICAL INTEGRATION
Fast convergent iteration procedure for calculating the isobaric wet bulb temperature
[KNMI-V-327] N80-18666
Remarks on the calculation of the kernel approximation in unsteady aerodynamics
[AAAF-NT-79-07] N80-18842
Numerical integration of a class of sinusoidal functions whose argument is the integral of a monotonic increasing function N80-18844

NUMERICAL STABILITY
Numerical instability and stabilization of the kinematic differential equation using quaternions
[NASA-TM-75731] N80-18811

NUMERICAL WEATHER FORECASTING
Results from establishing short term weather forecasts based on method of analogies
[KNMI-V-301] N80-18646

O

O RING SEALS
Circumferential shaft seal
[NASA-CASE-LEW-12119-2] N80-18401

O STARS
The formation of late O and B stars within dense molecular clouds N80-19007

OATS
Large Area Crop Inventory Experiment (LACIE). LACIE transition year plan for the direct estimation of wheat from LANDSAT imagery --- North Dakota
[E80-10059] N80-18510

OCEAN BOTTOM
A preliminary study of the consequences of deep ocean mining technology transfer
[PB-300723/4] N80-18546
Study of oceanic lithosphere using GEOS-3 radar altimeter data
[AD-A077344] N80-18673

OCEAN CURRENTS
Remote sensing of ocean surface current and current shear by HF backscatter radar
[AD-A078834] N80-18544
Description of a gradient verification program and a comparison between objectively and subjectively performed verification of the predicted currents from BK4
[KNMI-V-322] N80-18665
Analysis of acoustic variations in the ocean produced by combined environmental effects --- mathematical model of variations in sound propagation due to ocean currents N80-18879

OCEAN DATA ACQUISITIONS SYSTEMS
Oceanic wave measurement system
[NASA-CASE-MFS-23862-1] N80-18667
Mission and sensor concepts for coastal and ocean monitoring using spacecraft and aircraft
[NASA-TM-80103] N80-18672

OCEAN MODELS
Description of a gradient verification program and a comparison between objectively and subjectively performed verification of the predicted currents from BK4
[KNMI-V-322] N80-18665

OCEAN SURFACE
Satellite monitoring of sea surface pollution
[E80-10062] N80-18512
Remote sensing of ocean surface current and current shear by HF backscatter radar
[AD-A078834] N80-18544
Seasat gulf of Alaska workshop report
[NASA-CR-162463] N80-18549
Oceanic wave measurement system
[NASA-CASE-MFS-23862-1] N80-18667
Microscale measurements of temperature in the upper ocean from a towed body N80-18668
Tests of laser induced fluorescence from algae at sea
[FOA-C-30171-E1] N80-18678
Surface scattering studies
[AD-A078434] N80-18889

OCEANOGRAPHIC PARAMETERS
A summary of wave data needs and availability
[AD-A076067] N80-18674
Remote identification of a salt water wedge through dissipative media with a monocycle radar
[AD-A076621] N80-18675

OCEANOGRAPHY
The forecasting accuracy
[KNMI-V-320] N80-18625
An automated system for numerical forecasts of tidal heights, wind-driven seas, frontal waves and swells
[KNMI-V-311] N80-18652
Coastal water temperatures in the southeastern portion of Brazil from oceanographic data and NOAA satellite observations, volume 1
[INPE-1569-RPE/070] N80-18671
Symposium on Dissertations on Chemical Oceanography
[AD-A078526] N80-18676
Some basic aspects of oceanic internal waves and the sound-speed fluctuations they generate
[AD-A077537] N80-18677
European scientific notes, volume 33, no.7 --- airships, electric batteries, oceanography and fluid dynamics
[AD-A075097] N80-19019
OGIVES
Theoretical analysis of the flow field over a family of Ogive bodies, volume 2
[AD-A077397] N80-18000
OIL EXPLORATION
Computation of synthetic seismograms by the method of characteristics --- geophysical prospecting
N80-18593
OIL POLLUTION
Satellite monitoring of sea surface pollution
[E80-10062] N80-18512
OIL SLICKS
Satellite monitoring of sea surface pollution
[E80-10062] N80-18512
OKLAHOMA
Correlation of spacecraft passive microwave system data with soil moisture indices (API) --- Southern Great Plains States: Oklahoma and Kansas
[E80-10063] N80-18513
Measurement of soil moisture trends with airborne scatterometers --- Guymon, Oklahoma and Sublett, Kansas
[E80-10064] N80-18514
Dryland pasture and crop conditons as seen by HCMM --- Colby, Kansas and the Washita River watershed near Chickasha, Oklahoma
[E80-10074] N80-18523
OMEGA NAVIGATION SYSTEM
Differential Omega in the Alaska/Yukon region: An analytic assessment
[AD-A078517] N80-18018
Omega measurements in Stockholm
[FOA-C-20296-E3] N80-18027
ON-LINE PROGRAMMING
Automated air information production system, phase 1. Volume 4: Charting subsystem
[AD-A076107] N80-18728
Automated air information production system, phase 1. Volume 5: Cartographic EBR system
[AD-A076108] N80-18729
Automated air information production system, phase 1. Volume 1: Executive summary
[AD-A076104] N80-18730
Automated air information production system, phase 1. Volume 2: Publishing subsystem
[AD-A076105] N80-18731
Automated air information production system, phase 1. Volume 3: Air facilities subsystem
[AD-A076106] N80-18732
ONE DIMENSIONAL FLOW
Comparison of several finite difference schemes for time marching methods as applied to one dimensional nozzle flow
[VKI-TN-132] N80-18353
OPERATIONS RESEARCH
World Weather Watch: Global Observing System - Satellite sub-system. Information on the application of meteorological satellite data in routine operations and research: Abstracts, annual summaries and bibliographies
[WMO-475-SUPPL-2] N80-18631
OPERATOR PERFORMANCE
Field impact evaluation process on Electronic Tabular Display Subsystem (ETABS)
[AD-A078846] N80-18298
OPTICAL COMMUNICATION
Practical limitations on noiseless optical channel capacity N80-18063
The practical limits of photon communication
N80-18068
A review of fiber optics communications
[FOA-C-30173-E2] N80-18928
OPTICAL DATA PROCESSING
AgRISTARS: A joint program for agriculture and resources inventory surveys through aerospace remote sensing. Development and evaluation of clustering procedures --- large area crop inventories
[E80-10079] N80-18526
OPTICAL DENSITY
The kinetics of ion motion in CaF2:Er
[AD-A077555] N80-18911
OPTICAL HETERODYNING
Application of tunable diode lasers as local oscillators in an Infrared Heterodyne Radiometer (IHR)
[NASA-CR-159121] N80-18382
OPTICAL MEASURING INSTRUMENTS
Performance evaluation of the optical crosswind profiler
[AD-A075145] N80-18638
OPTICAL PUMPING
The physics of spin-polarized atomic vapors
[AD-A078589] N80-18912
OPTICAL RADAR
A microcomputer control system for the Urbana sodium lidar
[UILU-ENG-79-2507] N80-18378
Remote measurements of boundary layer velocity parameters by monostatic lidar
[AD-A078678] N80-18543
Design and performance of an experimental Dual-Frequency Doppler Lidar for remote measurement of wind velocity N80-18923
Lidar observations at 0.7-micrometers and 10.6-micrometers wavelengths during dusty infrared test 1 (dirt-1)
[AD-A075275] N80-18924
OPTICAL RESONATORS
The theory of optical resonators
[DRIC-TRANS-5616] N80-18392
OPTICAL TRACKING
The processing resource demands of failure detection in dynamic systems
[AD-A078329] N80-18420
Lightning tracking system evaluation
[AD-A078722] N80-18617
OPTICAL TRANSITION
Lidar observations at 0.7-micrometers and 10.6-micrometers wavelengths during dusty infrared test 1 (dirt-1)
[AD-A075275] N80-18924
OPTICAL WAVEGUIDES
Optical-microwave interactions in semiconductor devices
[AD-A078538] N80-18310
Development of high strength optical fiber waveguides using residual surface compression
[AD-A078296] N80-18926
OPTIMAL CONTROL
Optimal discounted linear control of the Wiener process
[AD-A078487] N80-18778
Optimal control of systems with uncertainty --- target acquisition
[AD-A078433] N80-18785
A functional expansion approach to the solution of nonlinear feedback problems
[AD-A077408] N80-18787
Approximation by polynomial arcs to generate suboptical numerical solutions in control problems
[INPE-1642-RPE/098-REV] N80-18809
OPTIMIZATION
Contributions of optimal receiver theory to digital equalization
[ETSI-04-176] N80-18284
Reliability analysis for optimum design
[ICAF-1132] N80-18418
Conjugate-gradient methods for large-scale nonlinear optimization
[AD-A078713] N80-18759
Incomplete block designs for comparing treatments with a control. 3: Optimal design for p = 4, k = 3 and p = 5, k = 3
[AD-A078331] N80-18784
Incomplete block designs for comparing treatments with a control. 1: General theory
[AD-A078330] N80-18786
A globally and quadratically convergent algorithm for general nonlinear programming problems
[AD-A077104] N80-18841
ORBIT TRANSFER VEHICLES
Orbital refill of propulsion vehicle tankage
[NASA-CR-159722] N80-18076
ORBITAL MECHANICS
An example of bifurcation to homoclinic orbits
[AD-A078432] N80-18818
ORBITAL POSITION ESTIMATION
Estimating the angular position of a moving deep space vehicle using two rotating tracking stations
N80-18064
State estimation of linear systems driven simultaneously by Wiener and Poisson processes
N80-18296
ORBITAL SPACE STATIONS
Technology for large space systems. A special bibliography with indexes, supplement 2
[NASA-SP-7046(02)] N80-18056
Strawman payload data for science and applications space platforms
[NASA-CR-161376] N80-18075
OREGON
An investigation of the utility of LANDSAT 2 MSS data to the fire-danger rating area, and forest fuel analysis within Crater Lake National Park, Oregon
N80-18500
ORGANIC CHEMISTRY
Organosilicon chemistry
[AD-A078293] N80-18100
ORGANIC LITHIUM COMPOUNDS
Styrene-butadiene copolymerization in organolithium systems N80-18174
ORGANIC SILICON COMPOUNDS
Organosilicon chemistry
[AD-A078293] N80-18100
ORGANOMETALLIC COMPOUNDS
Applications of open tubular columns to the gas chromatography of volatile metal complexes
N80-18122
The application of chromatography and ancillary techniques to the characterization of shale oil/oil shale compound classes and of organometallics
N80-18125
Preparation and properties of ((trimethyl silyl)methyl)-gallium 3 compounds
[AD-A076123] N80-18137
ORIFICE FLOW
Formations and transformations of a liquid stream flowing in air from polygonally shaped nozzles
[MPIS-28/1978] N80-18347
Environmental study of the interaction of two vortex rings having the same axis of symmetry
[MPIS-26/1978] N80-18352
OROGRAPHY
A study of the influence of orography and differential albedo on the atmospheric circulation: An application to the Brazilian Northeast
[INPE-1640-TDL/015] N80-18603
ORTHOGONAL FUNCTIONS
The development of normal functions N80-18808
ORTHONORMAL FUNCTIONS
The development of normal functions N80-18808
ORTHOTROPIC PLATES
Bending properties of non-homogeneous plates of isotropic and orthotropic materials
[TRITA-HFL-21] N80-18457
OSCILLATING FLOW
Dynamic stall on oscillating airfoils in oscillating free-streams N80-17983
Transient effects on a stalled airfoil in a pulsating flow: Comparison with results from a similar airfoil undergoing horizontal shaking --- during wind tunnel tests
[AAAF-NT-79-13] N80-18003
Implementation of unsteady oscillatory flow in a transonic wind tunnel
[AAAF-NT-79-15] N80-18004
OSCILLATORS
Electron and hole photocurrent effects on IMPATT oscillators N80-18291
Application of tunable diode lasers as local oscillators in an Infrared Heterodyne Radiometer (IHR)
[NASA-CR-159121] N80-18382
Methods of efficiency enhancement and scaling for the gyrotron oscillator
[AD-A075133] N80-18387
OXIDATION
Catalysts for the oxidation of carbon monoxide at low temperatures
[AD-A077323] N80-18129

Hydrogen chemisorption and oxidation on transition metal carbides N80-18958

OXIDATION RESISTANCE
Study of the effects of gaseous environments on the hot corrosion of superalloy materials
[NASA-CR-159747] N80-18155
Carbon impurity effect on the thermal degradation of a Si3N4-Y2O3 ceramic
[AD-A075138] N80-18190

OXIDATION-REDUCTION REACTIONS
Catalyst surfaces for the chromous/chromic redox couple
[NASA-CASE-LEW-13148-2] N80-18557

OXYGEN
Negative ion charge transfer of the reaction of S- and O- with atomic hydrogen producing H- ions from 1500 to 10 KeV N80-18892

OXYGEN MASKS
Prototype: Preliminary study on emergency breathing apparatus
[FOA-C-40103-C2] N80-18720

OXYGEN REGULATORS
Microvascular determinants of oxygen supply in resting and contracting striated muscle N80-18694

P

PACIFIC ISLANDS
Spectral analysis of synoptic scale disturbances over the Marshall Islands region N80-18596

PACIFIC OCEAN
The North Pacific Oscillation and eigenvectors of Northern Hemisphere atmospheric circulation during winter N80-18591
Summary of an eastpac refractive structure climatology
[AD-A075456] N80-18641

PANCREAS
Effect of restricted motion in high temperature on enzymatic activity of the pancreas
[NASA-TM-76063] N80-18683

PANELS
Collapse load analysis for plates and panels N80-18424

PAPERS
Forest resource information system --- Baker County, Florida and Picayune, Mississippi sites; St. Regis Paper Company
[E80-10065] N80-18515

PARAFFINS
Analysis of the geothermal binary cycle using paraffin hydrocarbons as working fluids N80-18553

PARALLEL PROCESSING (COMPUTERS)
Parallel digital simulation of power systems N80-18293
Guide to vectorization on the Naval Research Laboratory's Texas Instruments advanced scientific computer. Volume: Vectorization primer
[AD-A077365] N80-18760

PARAMAGNETISM
High temperature EPR study of superionic conductors and strongly exchange coupled paramagnets N80-18960

PARAMETERIZATION
Detection, estimation, and order reduction in multiparameter singularly perturbed systems N80-18288

PARTIAL DIFFERENTIAL EQUATIONS
An energetic approach to homogenization problems with rapidly oscillating potentials
[AD-A077134] N80-18840

PARTICLE ACCELERATION
Collective ion acceleration controlled by a gas gradient N80-18890

PARTICLE COLLISIONS
Theory of saturation spectroscopy including collisional effects
[AD-A075830] N80-18909

PARTICLE DIFFUSION
A functional approach to the statistical mechanics of fluid particles in turbulence N80-18325
A nodal greens function method for multidimensional neutron diffusion calculations N80-18919

PARTICLE INTERACTIONS
Deformation and hydrodynamic interaction of two particles in a suspension N80-18336
Coalescing Brownian motions on the line --- random walks N80-18795
The Boltzmann and the Fokker-Planck equations
[INPE-1606-RPE/082-REV] N80-18810
Particle interactions in plasmas
[INPE-1589-RPE/076] N80-18940
A numerical simulation of charged particle interactions with interplanetary shock waves N80-19015

PARTICLE MOTION
Radial confinement of central cell plasma in tandem mirrors N80-18933
Evolution of turbulence by three-dimensional numerical particle-vortex tracing
[AD-A076121] N80-18949

PARTICLE SIZE DISTRIBUTION
An investigation of particle size distribution using laser holography of burning solid propellant
[AD-A078904] N80-18210
Frequency-scanning particle size spectrometer
[NASA-CASE-NPO-13606-2] N80-18364
Effect of soil texture on the microwave emission from soils
[NASA-TM-80632] N80-18530
Numerical study of particle growth and water vapor concentration in noctilucent clouds
[AP-18] N80-18663

PARTICLE TRAJECTORIES
Deformation and hydrodynamic interaction of two particles in a suspension N80-18336

PASSENGER AIRCRAFT
Implications of fuel-efficient vehicles on ride quality and passenger acceptance: Workshop proceedings
[NASA-CP-2096] N80-18990

PATTERN RECOGNITION
Feature selection and classifier design with applications to remote sensing of mule deer N80-18505
Development of mathematical techniques for the analysis of remote sensing data
[E80-10056] N80-18508
Large Area Crop Inventory Experiment (LACIE). Evaluation of three-category classification
[E80-10058] N80-18509
Large Area Crop Inventory Experiment (LACIE). LACIE transition year plan for the direct estimation of wheat from LANDSAT imagery --- North Dakota
[E80-10059] N80-18510
Implementation of Badhwar classification of corn/soybean segments --- Illinois, Indiana, Iowa, and Missouri
[E80-10060] N80-18511
Large Area Crop Inventory Experiment (LACIE). Bibliographic addenda, technical reports, papers, and memorandums published under supporting research and technology and other research, test, and evaluation contracts for the Earth observations division
[E80-10070] N80-18519
AgRISTARS: A joint program for agriculture and resources inventory surveys through aerospace remote sensing. Development and evaluation of clustering procedures --- large area crop inventories
[E80-10079] N80-18526
Distance preserving linear feature selection
[REPT-19] N80-18527
The easy remote sensing problem
[REPT-20] N80-18528
The Cramer-Rao lower bound as a criteria for evaluating a large data reduction system such as LACIE
[REPT-21] N80-18529
Studies in image segmentation algorithms based on histogram clustering and relaxation N80-18741
A weighted line-finding algorithm
[AD-A076112] N80-18756
Connected component labeling using quadtrees
[AD-A076130] N80-18771
Second-order statistics of texture primitives
[AD-A077390] N80-18772

PAVEMENTS
Nondestructive evaluation of airport pavements. Volume 1: Program references
[AD-A078835] N80-18051
Structural evaluation of recycled pavement materials, volumes 1 and 2 N80-18232
Resilient based flexible pavement design procedure for secondary roads N80-18234
A study of flexible pavement crack dynamics and sealants N80-18242
Longitudinal joint systems in slip-formed rigid pavements. Volume 3: User's manual --- structural analysis
[AD-A078850] N80-18243
Methodology for predicting the reflection cracking life of asphalt concrete overlays
[PB80-101710] N80-18248
Pavement distress, evaluation, and performance
[PB80-101991] N80-18249
Texturing of concrete pavements
[PB80-106032] N80-18250

PAYLOADS
Strawman payload data for science and applications space platforms
[NASA-CR-161376] N80-18075

PENALTY FUNCTION
A globally and quadratically convergent algorithm for general nonlinear programming problems
[AD-A077104] N80-18841

PERFLUORO COMPOUNDS
Process for the preparation of new elastomeric polytriazines
[NASA-CASE-ARC-11248-2] N80-18180

PERFORMANCE PREDICTION
Performance estimates of a Boeing 747-100 transport mated with an outsize cargo pod
[NASA-TM-80227] N80-18032
Computer performance evaluation. A bibliography with abstracts
[PB80-802085] N80-18736

PERFORMANCE TESTS
Laboratory investigation of the performance of a Holden engine operating on liquified petroleum gas
[AD-A076145] N80-18411
A comprehensive approach to the performance measurement and evaluation of large-scale computer systems N80-18765

PERIODIC FUNCTIONS
Multiphase averaging of periodic soliton equations N80-18802

PERIPHERAL VISION
Size and luminance discrimination in the peripheral visual field
[MRL-R-760] N80-18703

PERMITTIVITY
Effect of soil texture on the microwave emission from soils
[NASA-TM-80632] N80-18530

PERSONALITY
The power process: A synthesis theory of power N80-18715

PERTURBATION THEORY
Detection, estimation, and order reduction in multiparameter singularly perturbed systems N80-18288
Perturbation solutions for blast waves in a low density gas
[VTH-LR-263] N80-18354

PHASE CONTROL
A ground based phase control system for the solar power satellite. Executive summary, volume 1, phase 3
[NASA-CR-160536] N80-18560
SPS pilot signal design and power transponder analysis, volume 2, phase 3
[NASA-CR-160537] N80-18561

PHASE ERROR
The identification and correction of channel-to-channel phase differences within a data processing system
[REPT-79-077] N80-18365

PHASE TRANSFORMATIONS
Phase change/heat storage materials data compilation
[AD-A076414] N80-18096
An experimental study of the phase separation process near the critical point --- method to perform quenching on materials near critical temperature to probe the phase transformations N80-18962

PHENOLOGY
Development of LANDSAT-based technology for crop inventories
[E80-10054] N80-18506
Development of LANDSAT-based technology for crop inventories: Appendices
[E80-10055] N80-18507
Large Area Crop Inventory Experiment (LACIE). LACIE transition year plan for the direct estimation of wheat from LANDSAT imagery --- North Dakota
[E80-10059] N80-18510

PHOTOCHEMICAL REACTIONS
Radiation augmented combustion
[AD-A077563] N80-18138
Photochemical conversion of coal to gasoline in an entrained bed reactor N80-18202
Evaluation of a photochemical system for nitrogen oxides control --- coal fired boilers N80-18583
PHOTOCHROMISM
Semiconductor electrodes 25: The p-GaAa/heatyl viologen system. Photoelectrochemical cells and photoelectrochromic displays
[AD-A075812] N80-18965
PHOTODISSOCIATION
Mechanisms of multiphoton dissociation of molecular ions
[AD-A077227] N80-18906
PHOTOELECTRIC EMISSION
Electron and hole photocurrent effects on IMPATT oscillators N80-18291
PHOTOGEOLOGY
HCMM: Soil moisture in relation to geologic structure and lithology, northern California
[E80-10067] N80-18516
The utilization of radar images in the geological mapping of pre-cambrian region: A proposed model
[INPE-1578-RPE/075] N80-18533
PHOTOGRAPHIC EMULSIONS
Method of and means for retarding dye fading during archival storage of developed color photographic film
[NASA-CASE-MFS-23250-1] N80-18362
PHOTOGRAPHIC FILM
Method of and means for retarding dye fading during archival storage of developed color photographic film
[NASA-CASE-MFS-23250-1] N80-18362
PHOTOGRAPHS
Method of and means for retarding dye fading during archival storage of developed color photographic film
[NASA-CASE-MFS-23250-1] N80-18362
PHOTOLYSIS
Isomerization and decomposition of 1.2 epoxy propane by intense CO2 laser radiation
[MPIS-18/1978] N80-18141
PHOTOMETRY
Aircraft program for target background, and sky radiance measurements
[AD-A076959] N80-18624
PHOTONS
Mechanisms of multiphoton dissociation of molecular ions
[AD-A077227] N80-18906
PHOTOVOLTAIC CELLS
Economic analysis of the design and fabrication of a space qualified power system
[NASA-TM-81418] N80-18098
Method of fabricating a photovoltaic module of a substantially transparent construction
[NASA-CASE-NPO-14303-1] N80-18550
PHYSICAL EXERCISE
Muscular force-velocity alterations consequent to slow and fast velocity power training N80-18696
PHYSICAL FITNESS
Muscular force-velocity alterations consequent to slow and fast velocity power training N80-18696
PHYSIOLOGICAL EFFECTS
Effect of restricted motion in high temperature on enzymatic activity of the pancreas
[NASA-TM-76063] N80-18683
Effect of consecutive cooling and immobilization on catecholamine metabolism in rat tissues
[NASA-TM-75962] N80-18684
Features of cholinergic cardia regulation under conditions of hypokinesia
[NASA-TM-76044] N80-18687
Muscular force-velocity alterations consequent to slow and fast velocity power training N80-18696
Hormone supply of the organism in prolonged emotional stress
[NASA-TM-76046] N80-18706
Physiologic reactions during five weeks of continuous residence in an artificial humid and hot climate
[NASA-TM-75356] N80-18707
Effects of gravitational stress, hypokinesia and hypodynamia on the structure of the vascular bed of the spleen
[NASA-TM-75934] N80-18711
PHYSIOLOGY
Cosmos 81 US/USSR cardiovascular study: Experiment implementation plan
[NASA-TM-81178] N80-18710
PIEZOELECTRIC CRYSTALS
Temperature compensated piezoelectric oxide materials --- investigation of piezoelectric crystal growth using Czochralski method for surface acoustic wave devices with electromechanical coupling
[AD-A077650] N80-18969
PIEZOELECTRICITY
Nonlinear ultrasonic parametric processes in piezoelectric semiconductors and ferroelectric insulators N80-18957
PILE FOUNDATIONS
Bearing capacity of driven piles in sand
N80-18237
PILOT ERROR
NASA aviation safety reporting system
[NASA-TM-78608] N80-18010
PILOT SELECTION
Pilot selection using psychological methods
[FOA-C-55024-H7] N80-18716
PIONEER PROJECT
The development of computer programs to determine atmospheric winds from entry probe data and possible applications to the Pioneer Venus mission N80-19011
PIONEER SPACE PROBES
Pioneer mission support N80-18061
PIONS
Pion scattering from the mass three system --- computation of elastic and charge exchange pion scattering angular distribution N80-18917
Field theoretic model of low-energy pion-nucleon elastic scattering N80-18918
PIPELINES
Flared tube attach system --- fluid flow lines
[NASA-CASE-MSC-18416-1] N80-18396
PIPES (TUBES)
Flared tube attach system --- fluid flow lines
[NASA-CASE-MSC-18416-1] N80-18396
PISTON ENGINES
Overview of a stirling engine test project
[NASA-TM-81442] N80-18564
PIVOTS
A study of some aspects of the mechanical behavior of cross-spring pivots and plate spring mechanisms with negative stiffness
[WTHD-116] N80-18416
PLANETARY COMPOSITION
Recent data on planets in the solar system
N80-19014
PLANETARY ENVIRONMENTS
Some experience with arc-heater simulation of outer planet entry radiation
[NASA-TM-80192] N80-18947
Recent data on planets in the solar system
N80-19014
PLANETARY EVOLUTION
An assessment of ground-based techniques for detecting other planetary systems. Volume 1: An overview --- workshop conclusions
[NASA-CP-2124] N80-18997
PLANETARY MAGNETIC FIELDS
Recent data on planets in the solar system
N80-19014
PLASMA CLOUDS
Computer simulation of gradient drift instability processes in operation Avefria
[AD-A077668] N80-18613
Preliminary numerical study of the outer scale size of ionospheric plasma cloud striations
[AD-A078492] N80-18618
PLASMA CONTROL
Radial confinement of central cell plasma in tandem mirrors N80-18933
Monte Carlo simulation of plasma confinement in mirror and cusp fields
[IPPJ-431] N80-18943
PLASMA DIAGNOSTICS
Investigation of the hollow cathode discharge at high current density N80-18931
PLASMA DYNAMICS
Airglow studies on the ionosphere dynamics over low latitude in Brazil
[INPE-1644-RPE/100-REV] N80-18600
PLASMA GENERATORS
Studies of transient discharges
[AD-A078894] N80-18318
PLASMA HEATING
A numerical investigation of the two stream instability and resonant heating of an inhomogeneous, axisymmetric, plasma column N80-18326
Lower hybrid heating associated with mode conversion on the Wisconsin octupole N80-18932
Theory of second harmonic electron cyclotron resonance heating of Tokamak plasma
[AD-A077538] N80-18950
PLASMA INTERACTIONS
The interaction of large-amplitude plasma waves with a moving electron plasma
[INPE-1626-RPE/091] N80-18936
Electromagnetic instabilities in a focused ion beam propagating through a Z-discharge plasma
[AD-A076154] N80-18948
PLASMA JETS
Electromagnetic instabilities in a focused ion beam propagating through a Z-discharge plasma
[AD-A076154] N80-18948
PLASMA RESONANCE
Theoretical analysis of the resonance cone in an inhomogeneous magnetoplasma column
[IPPJ-433] N80-18942
PLASMA WAVES
Excitation of electron plasma waves N80-18929
Relativistic nonlinear electron cyclotron waves in plasma
[INPE-1625-RPE/090] N80-18938
PLASMA-ELECTROMAGNETIC INTERACTION
Relativistic nonlinear electron cyclotron waves in plasma
[INPE-1625-RPE/090] N80-18938
Experimental results on plasma interactions with large surfaces at high voltages
[NASA-TM-81423] N80-18946
PLASMA-PARTICLE INTERACTIONS
Monte Carlo simulation of neutral-beam injection for mirror fussion reactors N80-18934
PLASMAS (PHYSICS)
The NRL CHMAIR code: A disturbed sea level air chemistry code
[AD-A077667] N80-18612
Computer simulation of gradient drift instability processes in operation Avefria
[AD-A077668] N80-18613
The interaction of large-amplitude plasma waves with a moving electron plasma
[INPE-1626-RPE/091] N80-18936
Theoretical analysis of the resonance cone in an inhomogeneous magnetoplasma column
[IPPJ-433] N80-18942
Explosion of strange attractors exhibited by Duffing's equation
[IPPJ-430] N80-18944
Theory of second harmonic electron cyclotron resonance heating of Tokamak plasma
[AD-A077538] N80-18950
PLASTIC COATINGS
Flexible formulated plastic separators for alkaline batteries
[NASA-CASE-LEW-12363-4] N80-18555
Flexible formulated plastic separators for alkaline batteries
[NASA-CASE-LEW-12363-3] N80-18556
PLASTIC DEFORMATION
Elastic/plastic indentation damage in ceramics. Part 1: The median/radial crack system. Part 2: A study of kink band formation in composites
[AD-A078839] N80-18197
Action of plastic deformations in the mechanical damage suffered by the surface of structures
[ICAF-1114] N80-18435
Repeated plastic deformation as a cause of mechanical surface damage in fatigue, wear, fretting-fatigue, and rolling fatigue: A review
[ICAF-1116] N80-18436
PLASTICIZERS
Tackifier for addition polyimides
[NASA-CASE-LAR-12642-1] N80-18179
PLASTICS
Variable temperature 119M SN Moessbauer study of organotin - substituted styrene monomers and polymers
[AD-A075958] N80-18188
PLATE THEORY
Acoustical behavior of thick, composite, fluid-loaded plates, calculated using Timoshenko-Mindlin plate theory
[AD-A077671] N80-18888
PLATEAUS
HCMM: Soil moisture in relation to geologic structure and lithology, northern California
[E80-10067] N80-18516

PLATES (STRUCTURAL MEMBERS)
Collapse load analysis for plates and panels N80-18424
PNEUMATIC EQUIPMENT
Improved tire/wheel concept --- pneumatic aircraft tire
[NASA-CASE-LAR-11695-2] N80-18402
POINTS (MATHEMATICS)
A column generation technique for the computation of stationary points
[AD-A076415] N80-18754
POISSON DENSITY FUNCTIONS
State estimation of linear systems driven simultaneously by Wiener and Poisson processes N80-18296
Error rates in Poisson discrimination N80-18846
POLAR REGIONS
Numerical modeling of high latitude winds in the upper atmosphere N80-18629
Suggestions for the contents of the Aviation Board survival kit
[FOA-A-59004-H3(H9)] N80-18721
POLARIZATION (CHARGE SEPARATION)
An intense source of negative polarized hydrogen ions N80-18897
POLARIZATION (SPIN ALIGNMENT)
The physics of spin-polarized atomic vapors
[AD-A078589] N80-18912
POLARONS
Bound small polaron transitions in magnesium oxide and beryllium oxide N80-18956
POLLUTION CONTROL
Evaluation of a photochemical system for nitrogen oxides control --- coal fired boilers N80-18583
Control of particulate emissions from turbine engine test cells by cooling water injection
[AD-A075947] N80-18587
POLLUTION MONITORING
Chemical and physical characterization of environmental pollutants N80-18121
Satellite monitoring of sea surface pollution
[E80-10062] N80-18512
POLYATOMIC MOLECULES
Three studies in the electronic and vibrational structure of polyatomic molecules. 1: The thermal lensing spectrometer and the local mode model of vibrational overtone spectra. 2: Calculations of second order hyperpolarizabilities. 3: The molecular structure of the benzyl radical and its ions and a program for normal mode analysis N80-18119
POLYETHYLENES
The physics of poly(ethylene oxide)/poly (methyl methacrylate) blends --- crystal growth N80-18175
POLYIMIDE RESINS
Fire test method for graphite fiber reinforced plastics
[NASA-TM-81436] N80-18107
Tackifier for addition polyimides
[NASA-CASE-LAR-12642-1] N80-18179
Comparison of the weight loss and adherence of nine different polyimide films thermally aged at 315 C and 350 C in air --- high temperature lubricants
[NASA-TM-81381] N80-18183
POLYIMIDES
Tackifier for addition polyimides
[NASA-CASE-LAR-12642-1] N80-18179
POLYISOPRENES
Specific solvent interactions and stress induced crystallinity in polymers N80-18176
Synthesis characterization and morphology of a cis 1, 4 polyisoprene/poly n-butylmethacrylate diblock copolymer
[AD-A078731] N80-18186
POLYMER CHEMISTRY
Calorimetric studies of polymer blend systems N80-18172
Process for the preparation of new elastomeric polytriazines
[NASA-CASE-ARC-11248-2] N80-18180
POLYMER PHYSICS
The physics of poly(ethylene oxide)/poly (methyl methacrylate) blends --- crystal growth N80-18175
POLYMERIC FILMS
Space radiation effects on Teflon films
[AD-A076613] N80-18194
POLYMERIZATION
Process for the preparation of new elastomeric polytriazines
[NASA-CASE-ARC-11248-2] N80-18180
Synthesis characterization and morphology of a cis 1, 4 polyisoprene/poly n-butylmethacrylate diblock copolymer
[AD-A078731] N80-18186
POLYMERS
Hygrothermal response of polymer matrix composite materials
[AD-A076623] N80-18110
Calorimetric studies of polymer blend systems N80-18172
Environmental stress cracking of polymers
[NASA-CR-162825] N80-18182
Adhesives: Properties, preparation, and applications, volume 2. A bibliography with abstracts
[PB80-801855] N80-18201
POLYNOMIALS
Computational complexity of real functions and polynomial time approximations N80-18746
Projective normalization of surfaces with a fixed Hilbert Polynomial N80-18796
Approximation by polynomial arcs to generate suboptical numerical solutions in control problems
[INPE-1642-RPE/098-REV] N80-18809
Probabilistic algorithms in finite fields
[AD-A078416] N80-18817
Unified treatment of some inequalities among ratios of means
[AD-A078464] N80-18819
POLYPEPTIDES
Effect of the enzymatic inhibitor of Kunitz on the gastric lesions from reserpine, from phenylbutazone, from pyloric ligation and by restraint in the rat
[NASA-TM-76027] N80-18681
POLYVINYL ALCOHOL
Specific solvent interactions and stress induced crystallinity in polymers N80-18176
POLYVINYL CHLORIDE
Crystallinity, morphology, and rheology of PVC-plasticizer systems N80-18171
POPULATION THEORY
Optimum rules for classification into two multivariate normal populations with the same covariance matrix
[AD-A077565] N80-18854
POPULATIONS
The role of exchangeability in inference
[AD-A077378] N80-18857
PORTABLE EQUIPMENT
Global Positioning Systems (GPS). Manpack/Vehicular User Equipment (MVUE). Volume 2: Set description
[AD-A076483] N80-18022
Global Positioning System (GPS). Manpack/Vehicular User Equipment (MVUE). Volume 3: Set description
[AD-A076484] N80-18023
POSITION (LOCATION)
Fiber optic sensors for measuring angular position and rotational speed --- air breathing engines
[NASA-TM-81454] N80-18368
POSITION ERRORS
Omega measurements in Stockholm
[FOA-C-20296-E3] N80-18027
POSITION INDICATORS
Experimental use of electronic direction finding indicators in snow removal
[VTI-130] N80-18413
Solar cell angular position transducer
[NASA-CASE-LAR-11999-1] N80-18552
POTENTIAL ENERGY
The energy budgets of a developing cyclone over the East China Sea during the 1975 Air Mass Transformation experiment --- study of potential and kinetic energy budgets N80-18627
POTENTIAL THEORY
An energetic approach to homogenization problems with rapidly oscillating potentials
[AD-A077134] N80-18840
POWDER METALLURGY
Advanced aluminum alloys from rapidly solidified powers
[AD-A077197] N80-18161
Development of advanced aluminum alloys from rapidly solidified powders for aerospace structural applications
[AD-A077800] N80-18162
Reaction bonded silicon nitride prepared from wet attrition-milled silicon --- fractography
[NASA-TM-81428] N80-18181
POWDERED ALUMINUM
Advanced aluminum alloys from rapidly solidified powers
[AD-A077197] N80-18161
Development of advanced aluminum alloys from rapidly solidified powders for aerospace structural applications
[AD-A077800] N80-18162
POWER
The power process: A synthesis theory of power N80-18715
POWER AMPLIFIERS
An X-band array antenna module with Si-IMPATT diode amplifier. Volume 1: Text
[FOA-C-30154-E1-VOL-1] N80-18280
An X-band array antenna module with Si-IMPATT diode amplifier. Volume 2: Figures and tables
[FOA-C-30154-E1-VOL-2] N80-18281
An X-band array antenna module with GaAs IMPATT diode amplifier. Volume 1: Text
[FOA-C-30155-E1-VOL-1] N80-18282
An X-band array antenna module with GaAs IMPATT diode amplifier. Volume 2: Figures and tables
[FOA-C-30155-E1-VOL-2] N80-18283
POWER CONDITIONING
Software development, item 0005 of microprocessor-based power conditioner controller
[AD-A076118] N80-18757
POWER EFFICIENCY
Effect of geometry and operating conditions on spur gear system power loss
[NASA-TM-81426] N80-18406
PRECIPITATION (METEOROLOGY)
A quasi-objective method for precipitation prediction
[KNMI-V-318] N80-18660
Precipitation, open water evaporation and potential precipitation surplus in the Netherlands: Frequency distributions in the growing season
[KNMI-WR-79-4] N80-18662
PRECIPITATION HARDENING
An evaluation of processes for the blackening of precipitation-hardened stainless steels
[AD-A075134] N80-18158
PRECISION GUIDED PROJECTILES
Electro-optical handbook. Volume 1: Weather support for precision guided munitions
[AD-A075168] N80-18637
PREDICTION ANALYSIS TECHNIQUES
Solar-Terrestrial Predictions Proceedings. Volume 1: Prediction group reports
[NASA-CR-162794] N80-18462
A method of predictions geomagnetic activity based on a coronal model of relations between solar and geomagnetic activities N80-18466
MSFC solar activity predictions for satellite orbital lifetime estimation N80-18492
PPS76: A computerized event mode solar proton forecasting technique N80-18495
Analysis of future event set algorithms for discrete event simulation N80-18743
PREDICTIONS
Long term solar activity and ionospheric prediction services rendered by the National Physical Laboratory, New Delhi N80-18472
Solar activity predictions at Peking Observatory N80-18475
The use of ionospheric indices to make real- and near-real-time forecasts of foF2 around Australia N80-18484
Prediction limits for foF2 N80-18485
A weekly ionospheric index N80-18486
Predictions of the Space Environment Services Center N80-18489
Geophysical forecasting at AFGWC --- aerospace environments N80-18490
Tide forecasting accuracy
[KNMI-V-320] N80-18625
An automated system for numerical forecasts of tidal heights, wind-driven seas, frontal waves and swells
[KNMI-V-311] N80-18652
PRESIDENTIAL REPORTS
International transfer of technology
[GPO-37-153] N80-18989
PRESSURE DISTRIBUTION
Unsteady effects with control surfaces --- measured in a wind tunnel
[AAAF-NT-79-01] N80-18049

PRESSURE EFFECTS
Environmental effects on the mechanism of fretting fatigue in 7075-T6 aluminum N80-18147
PRESSURE GRADIENTS
The influence of a high pressure gradient on unsteady velocity perturbations in the case of a turbulent supersonic flow
[AAAF-NT-79-10] N80-18348
Collective ion acceleration controlled by a gas gradient N80-18890
PRESSURE ICE
Statistical methods of probable use for understanding remote sensing data --- estimating ice pressure ridge characteristics
[AD-A076908] N80-18535
PRESSURE MEASUREMENTS
Unsteady flow measurements in air intakes
[AAAF-NT-79-16] N80-18005
Resonant Doppler velocimeter --- velocity, temperature, and pressure measurement
[NASA-CR-162815] N80-18341
Static pressure orifice system testing method and apparatus
[NASA-CASE-LAR-12269-1] N80-18358
PRESSURE REGULATORS
Intra-ocular pressure normalization technique and equipment
[NASA-CASE-LEW-12723-1] N80-18690
PRESSURE VESSELS
Fatigue behaviour of high-pressure vessels
[LBF-FB-148] N80-18441
PRIMARY BATTERIES
Silver cells, volume 1. Citations from the NTIS data base
[PB80-802309] N80-18580
Silver cells, volume 2. Citations from the NTIS data base
[PB80-802317] N80-18581
Silver cells. Citations from the Engineering Index data base
[PB80-802325] N80-18582
PROBABILITY DENSITY FUNCTIONS
Convergence of weighted sums of random elements in type p spaces
[AD-A077438] N80-18864
PROBABILITY DISTRIBUTION FUNCTIONS
Conservatism in random vibration analysis and testing N80-18220
The extreme points of the set of decreasing failure rate distributions
[AD-A078774] N80-18838
Some recent developments in multiple decision theory: A brief overview
[AD-A077710] N80-18980
PROBABILITY THEORY
Verification of figure expectations --- for validating the accuracy of weather reports
[KNMI-V-298] N80-18644
Probabilistic algorthms in finite fields
[AD-A078416] N80-18817
Logistic discriminant analysis
[KNMI-V-310] N80-18868
PROBLEM SOLVING
A truth maintenance system --- artificial intelligence
[AD-A078419] N80-18770
Using patterns and plans to solve problems and control search
[AD-A076872] N80-18773
Optimal investigatiOn as a regenerative stopping problem
[AD-A078510] N80-18782
Approximation by polynomial arcs to generate suboptical numerical solutions in control problems
[INPE-1642-RPE/098-REV] N80-18809
PRODUCT DEVELOPMENT
Development of improved wraparound contacts for silicon
[NASA-CR-159748] N80-18554
PRODUCTION ENGINEERING
Advanced manufacturing development of a composite empennage component for I-1011 aircraft
[NASA-CR-162862] N80-18104
Method of fabricating a photovoltaic module of a substantially transparent construction
[NASA-CASE-NPO-14303-1] N80-18550
Maximum likelihood estimation of a distribution function with monotone failure rate based on censored observations
[AD-A077459] N80-18862
PROGRAM VERIFICATION (COMPUTERS)
The Cramer-Rao lower bound as a criteria for evaluating a large data reduction system such as LACIE
[REPT-21] N80-18529
Computer performance evaluation. A bibliography with abstracts
[PB80-802085] N80-18736
PROGRAMMERS
Portability of large COBOL programmers: The cobol programmer's workbench
[AD-A076917] N80-18752
PROGRAMMING LANGUAGES
Programs for the transonic wind tunnel data processing installation. Part 7: Extended focal
[AD-A073414] N80-18054
Formal methods and human factors in the design of interactive languages N80-18739
Topics in computational complexity --- graph theory N80-18748
Design of a verifiable subset for HAL/S
[NASA-CR-162814] N80-18751
The design and implementation of a relational and network database access language N80-18981
PROJECT PLANNING
Cosmos 81 US/USSR cardiovascular study: Experiment implementation plan
[NASA-TM-81178] N80-18710
PROPAGATION
Alternative decouplings of the electron propagator N80-18899
PROPANE
Isomerization and decomposition of 1,2 epoxy propane by intense CO2 laser radiation
[MPIS-18/1978] N80-18141
PROPELLANT ACTUATED INSTRUMENTS
Pressure limiting propellant actuating system
[NASA-CASE-MSC-18179-1] N80-18097
PROPELLANT COMBUSTION
Combustion stability with baffles, absorbers and velocity sensitive combustion --- liquid propellant rocket combustors
[NASA-CR-162803] N80-18128
PROPELLANT STORABILITY
Propellant surveillance report LGM-30 F & G stage 1, phase E, series 8, TP-H1011
[AD-A078777] N80-18208
PROPELLANT TESTS
Propellant surveillance report LGM-30, A, B, F, G, stage 1, TP-H1043 AFT closure propellant --- minuteman missiles
[AD-A078778] N80-18207
Propellant surveillance report LGM-30 F & G stage 1, phase E, series 8, TP-H1011
[AD-A078777] N80-18208
PROPELLANT TRANSFER
Orbital refill of propulsion vehicle tankage
[NASA-CR-159722] N80-18076
PROPULSION SYSTEM CONFIGURATIONS
Orbital refill of propulsion vehicle tankage
[NASA-CR-159722] N80-18076
An automatically-shifted two-speed transaxle system for an electric vehicle
[NASA-CR-159746] N80-18992
PROTECTIVE CLOTHING
A new anti-G value for high-performance aircraft
[AD-A076904] N80-18719
PROTECTIVE COATINGS
Internal coating of air cooled gas turbine blades
[NASA-CR-159701] N80-18041
Fluoroalkyl siloxanes as liquid-repellent fabric finishes. Part 2: The homopolymers and their copolymers with alkyl silanes
[AD-A073150] N80-18185
High solids coating systems --- air pollution
[AD-A076433] N80-18193
PROTON FLUX DENSITY
A review of short-term flare forecasting activities at Toyokawa N80-18479
PPS76: A computerized event mode solar proton forecasting technique N80-18495
Long Duration Exposure Emulsion Package (LDEEP)
[AD-A077362] N80-18914
PROTOSTARS
Theoretical models of stellar formation --- the stellar evolution from interstellar gas and matter to protostars N80-19006
PROTOTYPES
Prototype: Preliminary study on emergency breathing apparatus
[FOA-C-40103-C2] N80-18720
PSYCHOLOGICAL TESTS
Pilot selection using psychological methods
[FOA-C-55024-H7] N80-18716
PULMONARY FUNCTIONS
Mass transfer studies of pulmonary function N80-18700
PULSED LASERS
The practical limits of photon communication N80-18068
Flameout and acoustic damping in pulsed chemical lasers
[AD-A076124] N80-18388
PULSED RADIATION
Necessary conditions for the homogeneous formation of a volume avalanche discharge with specific applications to rare gas-halide excimer laser discharges N80-18373
PUMP SEALS
Analysis and design of a uniform-clearance, pumping-ring rod seal for the Stirling engine
[NASA-TM-81463] N80-18408
PYRIDINES
Semiconductor electrodes 27: The p- and n-GaAs-N, N'-dimethyl-4, 4'-bipyridinium system, enhancement of hydrogen evolution on p-GaAs and stabilization of n-GaAs electrodes
[AD-A075813] N80-18966
PYROLYSIS
A small-scale test for fiber release from carbon composites --- pyrolysis and impact
[NASA-TM-81179] N80-18105

Q

QUADRATIC PROGRAMMING
A column generation technique for the computation of stationary points
[AD-A076415] N80-18754
A globally and quadratically convergent algorithm for general nonlinear programming problems
[AD-A077104] N80-18841
QUALITY CONTROL
Propellant surveillance report LGM-30, A, B, F, G, stage 1, TP-H1043 AFT closure propellant --- minuteman missiles
[AD-A078778] N80-18207
Safety studies of lithium-sulfur dioxide cells
[AD-A077277] N80-18573
Analysis of variance with unequal variances
[AD-A077653] N80-18866
QUATERNIONS
Numerical instability and stabilization of the kinematic differential equation using quaternions
[NASA-TM-75731] N80-18811
QUENCHING (COOLING)
An experimental study of the phase separation process near the critical point --- method to perform quenching on materials near critical temperature to probe the phase transformations N80-18962

R

RADAR
Signal processing for unattended radar
[AD-A078478] N80-18278
Remote identification of a salt water wedge through dissipative media with a monocycle radar
[AD-A076621] N80-18675
RADAR ECHOES
ALTAIR observations of ionospheric irregularities and background densities
[AD-A078599] N80-18615
RADAR EQUIPMENT
Hardened radar component materials development study
[AD-A077805] N80-18277
RADAR HOMING MISSILES
Radar image simulation of seasonally dependent reference scenes
[AD-A076119] N80-18538

RADAR IMAGERY
Radar image simulation: A project to develop a model, define its operational constraints, validate its accuracy, and to produce sample results, volume 1 and 2 N80-18257
System-design consideration for an optical correlator for the Seasat-A synthetic-aperture radar
[AD-A071358] N80-18265
Measurement of soil moisture trends with airborne scatterometers --- Guymon, Oklahoma and Sublett, Kansas
[E80-10064] N80-18514
The utilization of radar images in the geological mapping of pre-cambrian region: A proposed model
[INPE-1578-RPE/075] N80-18533
Radar image simulation of seasonally dependent reference scenes
[AD-A076119] N80-18538

RADAR NAVIGATION
GPS and EAR/GEANS software support
[AD-A078607] N80-18025

RADAR NETWORKS
Analysis of new protocols for computer communication networks N80-18766

RADAR TARGETS
Radar target for remotely sensing hydrological phenomena
[NASA-CASE-LAR-12344-1] N80-18498
Radar image simulation of seasonally dependent reference scenes
[AD-A076119] N80-18538

RADAR TRACKING
Radar surveillance/radar tracking variant to SPEARS
[AD-A076147] N80-18267
Lightning tracking system evaluation
[AD-A078722] N80-18617

RADIAL FLOW
Radial confinement of central cell plasma in tandem mirrors N80-18933

RADIANCE
Satellite atmospheric radiance measurements in the vacuum ultraviolet
[AD-A078628] N80-18620

RADIANT FLUX DENSITY
Microwave power transmission beam safety system
[NASA-CASE-NPO-14224-1] N80-18287

RADIATION DAMAGE
Inelastic electron tunneling spectroscopy of UV irradiated molecules N80-18116

RADIATION DISTRIBUTION
Design of injection lasers for improved radiation performance
[AD-A078519] N80-18391

RADIATION EFFECTS
Space radiation effects on Teflon films
[AD-A076613] N80-18194
Investigation of the basic mechanisms of radiation effects on semiconductor devices used in electro-optical sensor applications
[AD-A076940] N80-18315
The radiation protection program
[EUR-5972] N80-18701
Deep level transient spectroscopy studies of radiation inducing defects in silicon N80-18963
Solar radiation test
[AD-A075734] N80-19018

RADIATION HARDENING
Millimeter wave hardened antenna window materials development --- for ballistic missile defense interceptor applications
[AD-A076769] N80-18271
Hardened radar component materials development study
[AD-A077805] N80-18277

RADIATION MEASUREMENT
A coherent nonlinear theory of auroral kilometric radiation
[AD-A078918] N80-18619

RADIATION MEDICINE
Activities report on reactor physics, 1977 to 1978 N80-18712

RADIATION PROTECTION
The radiation protection program
[EUR-5972] N80-18701
KVAST: A computer program to calculate the protection offered by buildings to fall-out radiation
[FOA-C-20321-A2] N80-18916

RADIATIVE HEAT TRANSFER
Some experience with arc-heater simulation of outer planet entry radiation
[NASA-TM-80192] N80-18947

RADICALS
Functional group selective high performance liquid chromatographic stationary phases N80-18117
Three studies in the electronic and vibrational structure of polyatomic molecules. 1: The thermal lensing spectrometer and the local mode model of vibrational overtone spectra. 2: Calculations of second order hyperpolarizabilities. 3: The molecular structure of the benzyl radical and its ions and a program for normal mode analysis N80-18119

RADIO ALTIMETERS
Study of oceanic lithosphere using GEOS-3 radar altimeter data
[AD-A077344] N80-18673

RADIO ASTRONOMY
Radio astronomy N80-18062
An assessment of ground-based techniques for detecting other planetary systems. Volume 1: An overview --- workshop conclusions
[NASA-CP-2124] N80-18997
La Posta solar radio maps
[AD-A076376] N80-19017

RADIO COMMUNICATION
The 30/20 GHz fixed communications systems service demand assessment. Volume 1: Executive summary
[NASA-CR-159619] N80-18262
The 30/20 GHz fixed communications systems service demand assessment. Volume 2: Main report
[NASA-CR-159620] N80-18263
The 30/20 GHz fixed communications systems service demand assessment. Volume 3: Annex
[NASA-CR-159621] N80-18264

RADIO FREQUENCIES
Radio frequency arraying method for receivers
[NASA-CASE-NPO-14328-1] N80-18253

RADIO FREQUENCY INTERFERENCE
Comparison of measured data with IF-77 propagation model predictions
[AD-A076508] N80-18259
A simplified indexing of F-region geophysical noise at low latitudes N80-18473

RADIO INTERFEROMETERS
Positions and movement of VHF lightning sources determined with microsecond resolution by interferometry N80-18595

RADIO RECEIVERS
Global Positioning Systems (GPS). Manpack/Vehicular User Equipment (MVUE). Volume 2: Set description
[AD-A076483] N80-18022
Global Positioning System (GPS). Manpack/Vehicular User Equipment (MVUE). Volume 3: Set description
[AD-A076484] N80-18023
Radio frequency arraying method for receivers
[NASA-CASE-NPO-14328-1] N80-18253

RADIO SIGNALS
Validation of roundtrip charged-particle calibrations derived from S- and X-band Doppler via DRVID measurements N80-18065

RADIO TELEMETRY
Test methods for telemetry systems and subsystems. Volume 3: Test methods for recorder/reproducer systems and magnetic tape
[AD-A075736] N80-18091
Test methods for telemetry systems and subsystems. Volume 4: Test methods for data multiplex equipment
[AD-A075789] N80-18092

RADIO TRANSMISSION
Comparison of measured data with IF-77 propagation model predictions
[AD-A076508] N80-18259
Stimulated-Emission-of-Energetic-Particles (SEEP) experiment
[AD-A075503] N80-18269
The sensitivity of satellite communications to the uncertainties in selected chemical reaction rate coefficients
[AD-A078924] N80-18279
Forecasts of geomagnetic activities and HF radio propagation conditions made at Hiraiso/Japan N80-18478
Radio propagation prediction services in Japan N80-18480
Radio disturbance warning issuance system N80-18481
A review of the operation of the IUWDS Regional Warning Centre at the Ionospheric Prediction Service, Sydney N80-18482

RADIO WAVES
Propagation predictions for the HF-range by the Research Institute of the Deutsche Bundespost --- predictions based on reliable sunspot number and solar-terrestrial data N80-18465
Estimation of solar flame influence on radio circuit transmission loss N80-18468

RADIOACTIVE ISOTOPES
Induced radioactivity in recovered Skylab materials --- gamma ray spectra
[NASA-TM-78263] N80-18904

RADIOGRAPHY
Nondestructive testing: X-ray photography and radiography, volume 2: Citations from the Engineering Index data base
[PB80-802200] N80-18421
Nondestructive testing: X-ray photography and radiography. Citations from the NTIS data base
[PB80-802192] N80-18422

RADIOMETERS
Use of satellite imagery for the derivation of the hydrogeologic characteristics of a test area in semiarid climates N80-18545

RADIOSONDES
Induction powered biological radiosonde
[NASA-CASE-ARC-11120-1] N80-18691

RADOMES
Final evaluation of rain erosion on sled test results at Mach 3.7 to 5.0 for slip-cast fused silica radome structures
[AD-A077348] N80-18113

RAIN
Final evaluation of rain erosion on sled test results at Mach 3.7 to 5.0 for slip-cast fused silica radome structures
[AD-A077348] N80-18113
High-intensity rainfall statistics for Canada
[CRC-1329-E] N80-18632
Precipitation estimation using satellite data
[AD-A075978] N80-18639

RAIN GAGES
Systematic wind error and the standard pluviometric
[KNMI-V-317] N80-18659

RAINSTORMS
Precipitation estimation using satellite data
[AD-A075978] N80-18639

RAMAN SPECTROSCOPY
Applications of Coherent Anti-Stokes Raman Spectroscopy (CARS) N80-18127

RANDOM LOADS
Study on crack propagation under quasi-random loading
[DOC-XIII-876-78] N80-18431

RANDOM PROCESSES
Realization theory for multivariate Gaussian processes. 2: State space theory revisited and dynamical representations of finite dimensional
[AD-A078749] N80-18836
Optional sampling of submartingales indexed by partially ordered sets
[AD-A077409] N80-18856

RANDOM VARIABLES
Convergence theorems for abstract asymptotic martingales N80-18804
Convergence of weighted sums of random elements in type p spaces
[AD-A077438] N80-18864

RANDOM VIBRATION
MIL-STD-781C random reliability testing performed by using acoustic coupling N80-18219
Conservatism in random vibration analysis and testing N80-18220
Incandescent lamp life under random vibration N80-18221

RANDOM WALK
Coalescing Brownian motions on the line --- random walks N80-18795

RANGELANDS
Correlation of spacecraft passive microwave system data with soil moisture indices (API) --- Southern Great Plains States: Oklahoma and Kansas
[E80-10063] N80-18513

Plant cover, soil temperature, freeze, water stress, and evapotranspiration conditions --- Rio Grande Valley, Texas
[E80-10072] N80-18521

RAPID QUENCHING (METALLURGY)
Application of solidification theory to rapid solidification processing
[AD-A076947] N80-18165

RARE EARTH ELEMENTS
Dipolar defects in rare-earth doped alkaline-earth fluorides
[AD-A077580] N80-18971

RARE GASES
Necessary conditions for the homogeneous formation of a volume avalanche discharge with specific applications to rare gas-halide excimer laser discharges N80-18373
Experimental and theoretical determination of the velocity dependance of the scattering cross sections in monomer-dimer noble gas collisions
[MPIS-19/1978] N80-18915

RAREFIED GASES
Perturbation solutions for blast waves in a low density gas
[VTH-LR-263] N80-18354

REACTOR MATERIALS
Fatigue crack growth of A508 steel in high-temperature, pressurized reactor-grade water
[AD-A075506] N80-18159

REACTOR PHYSICS
Activities report on reactor physics, 1977 to 1978 N80-18712

READ-ONLY MEMORY DEVICES
A microprocessor controlled PROM programmer
[AD-A073154] N80-18733

READERS
Data detection in high density digital magnetic recording N80-18727

READING
An evaluation of map design and map reading using eye movement recordings N80-18499

READOUT
Laser measuring system for incremental assemblies --- measuring wire-wrapped frame assemblies in spark chambers
[NASA-CASE-GSC-12321-1] N80-18380

REAL NUMBERS
Computational complexity of real functions and polynomial time approximations N80-18746

REAL TIME OPERATION
Preliminary telemetry operations experience with the real-time combiner, 1 November 1978 to 1 November 1979 N80-18072

RECEIVERS
A navigation algorithm for single channel low-cost GPS receiver N80-18016

RECOMBINATION REACTIONS
Transport and recombination properties of lead tin telluride alloys
[AD-A078687] N80-18166
High pressure laser plasma studies --- energy pathways in He-Ar gas mixtures at low pressure
[NASA-CR-162824] N80-18945

RECURSIVE FUNCTIONS
Computational complexity of real functions and polynomial time approximations N80-18746

RECYCLING
Structural evaluation of recycled pavement materials, volumes 1 and 2 N80-18232

REENTRY VEHICLES
Turbulent-boundary-layer excitation and response thereto for a high-performance conical vehicle --- reentry N80-18229

REFLECTANCE
Plant cover, soil temperature, freeze, water stress, and evapotranspiration conditions --- Rio Grande Valley, Texas
[E80-10072] N80-18521

REFRIGERATING
Cryogenic refrigeration, volume 3. A bibliography with abstracts
[PB80-802051] N80-18251

REFRIGERATORS
Operation of Joule-Thompson refrigeration above the critical pressure of helium N80-18066

REFUELING
Orbital refill of propulsion vehicle tankage
[NASA-CR-159722] N80-18076

REGRESSION ANALYSIS
Maximum likelihood estimation in autoregressive processes with missing observation N80-18806
Jackknife, ridge and ordinary least squares estimators of regression parameters: A Monte Carlo comparison
[AD-A077724] N80-18831
A linear programming approach to a simple linear regression problem with least absolute value criterion
[AD-A078622] N80-18833
Rank weighting in multiattribute utility decision making: Avoiding the pitfalls of equal weights
[AD-A078941] N80-18858
Nonparametric regression based on the concomitants of order statistics
[AD-A077636] N80-18867

REINFORCED PLASTICS
Literature review on the mechanical behavior of fiber composite materials. Analysis of the state-of-the-art, volume 1
[LBF-TB-145-VOL-1] N80-18439
Literature review on the mechanical behavior of fiber composite materials. Analysis of the state-of-the-art. Volume 2: Appendix
[LBF-TB-145-VOL-2-APP] N80-18440

REINFORCEMENT (STRUCTURES)
Resistance of reinforced concrete structures under high intensity loads --- nuclear detonations N80-18235
Response of ten story, reinforced concrete model frames to simulated earthquakes N80-18240

REINFORCING FIBERS
Collapse load analysis for plates and panels N80-18424
Literature review on the mechanical behavior of fiber composite materials. Analysis of the state-of-the-art, volume 1
[LBF-TB-145-VOL-1] N80-18439

RELATIVISTIC ELECTRON BEAMS
Intense relativistic electron beam investigations
[AD-A078515] N80-18920

RELATIVISTIC PLASMAS
Relativistic nonlinear electron cyclotron waves in plasma
[INPE-1625-RPE/090] N80-18938

RELATIVITY
Initial value problems on non-euclidean topologies N80-18977

RELAXATION METHOD (MATHEMATICS)
Studies in image segmentation algorithms based on histogram clustering and relaxation N80-18741

RELIABILITY ANALYSIS
Reliability analysis for optimum design
[ICAF-1132] N80-18418

RELIABILITY ENGINEERING
The application of reliability improvement warranty to dynamic systems
[AD-A075520] N80-18419

REMOTE CONTROL
Signal processing for unattended radar
[AD-A078478] N80-18278

REMOTE SENSORS
Helicopter remote wind sensor system description
[AD-A076153] N80-18024
InSb charge coupled infrared imaging device: The 20 element linear imager
[NASA-CR-3235] N80-18361
Fiber optic sensors for measuring angular position and rotational speed --- air breathing engines
[NASA-TM-81454] N80-18368
Radar target for remotely sensing hydrological phenomena
[NASA-CASE-LAR-12344-1] N80-18498
Feature selection and classifier design with applications to remote sensing of mule deer N80-18505
Significant results from a project on agricultural statistics, 1975 - 1978
[INPE-1609-NTE/155] N80-18532
Statistical methods of probable use for understanding remote sensing data --- estimating ice pressure ridge characteristics
[AD-A076908] N80-18535
Remote sensing of ocean surface current and current shear by HF backscatter radar
[AD-A078834] N80-18544
Seasat gulf of Alaska workshop report
[NASA-CR-162463] N80-18549
Performance evaluation of the optical crosswind profiler
[AD-A075145] N80-18638
Remote identification of a salt water wedge through dissipative media with a monocycle radar
[AD-A076621] N80-18675

REMOTELY PILOTED VEHICLES
New remotely piloted vehicle launch and recovery concepts: Computer program listings
[AD-A076611] N80-18035

RESEARCH AND DEVELOPMENT
Study of research and development requirements of small gas-turbine combustors
[NASA-CR-159796] N80-18040
The radiation protection program
[EUR-5972] N80-18701
Ames Research Center publications: A continuing bibliography, 1978
[NASA-TM-81175] N80-18985
European scientific notes, volume 33, no.7 --- airships, electric batteries, oceanography and fluid dynamics
[AD-A075097] N80-19019
Research and pedagogy in noise and vibration control N80-19020

RESEARCH FACILITIES
Research activities in high energy physics, 1977 N80-18921
Research activities in high energy physics, 1978 --- particle theory experimentation and instrumentation N80-18922

RESEARCH MANAGEMENT
Pavement distress, evaluation, and performance
[PB80-101991] N80-18249
Texturing of concrete pavements
[PB80-106032] N80-18250

RESEARCH PROJECTS
NASA's university program: Active projects, fiscal year 1979
[NASA-TM-81777] N80-18979

RESIDUAL STRESS
Local residual stress near fatigue crack tip --- X-ray diffraction measurement technique
[ICAF-1129] N80-18433

RESILIENCE
Resilient based flexible pavement design procedure for secondary roads N80-18234

RESOURCES MANAGEMENT
LACIE evaluation and outlook panel transcript: The LACIE Symposium
[E80-10069] N80-18518

RHEOLOGY
Crystallinity, morphology, and rheology of PVC-plasticizer systems N80-18171

RHEOMETERS
Viscosity measuring instrument
[NASA-CASE-NPO-14501-1] N80-18357

RIBONUCLEIC ACIDS
Topochemical differences in the amount of RNA in the motoneurons of the spinal chord in hypoxia and hypokinesia
[NASA-TM-75994] N80-18689

RIDING QUALITY
Implications of fuel-efficient vehicles on ride quality and passenger acceptance: Workshop proceedings
[NASA-CP-2096] N80-18990

RIGID ROTORS
A hingeless rotor XV-15 design integration feasibility study. Volume 1: Engineering design studies
[NASA-CR-152310] N80-18030

RIGID STRUCTURES
Longitudinal joint systems in slip-formed rigid pavements. Volume 3: User's manual --- structural analysis
[AD-A078850] N80-18243
Stress analysis and buckling of J-stiffened graphite-epoxy panel
[NASA-TP-1607] N80-18427

RING CURRENTS
Electric fields in the low latitude ionosphere and their relationship to magnetospheric and interplanetary phenomena N80-18597
Study of the storm time fluxes of heavy ions
[NASA-CR-162826] N80-18605

RINGS (MATHEMATICS)
Generalized inverses of matrices over local rings N80-18875

RIO GRANDE (NORTH AMERICA)
Plant cover, soil temperature, freeze, water stress, and evapotranspiration conditions --- Rio Grande Valley, Texas
[E80-10072] N80-18521
RISK
The asymptotic distribution of mortality rates in competing risks analyses
[AD-A078948] N80-18859
RIVER BASINS
HCMM energy budget data as a model input for assessing regions of high potential groundwater pollution --- Big Sioux River Basin, SOuth Dakota
[E80-10075] N80-18524
ROADS
Resilient based flexible pavement design procedure for secondary roads N80-18234
The influence of road roughness on the braking and steering performance of cars
[VTI-134] N80-18414
ROCKET SOUNDING
Rocketborne ionospheric studies
[AD-A078799] N80-18616
RODS
A contribution to nonlinear rod theory --- for rotor blade stress analysis
[NASA-TM-75734] N80-18445
ROLLER BEARINGS
Constrained fatigue life optimization of a NASVYTIS multiroller traction drive
[NASA-TM-81447] N80-18407
ROLLING CONTACT LOADS
Endurance and failure characteristics of modified Vasco X-2, CBS 600 and AISI 9310 spur gears --- aircraft construction materials
[NASA-TM-81421] N80-18405
ROTARY WINGS
Dynamic stall on oscillating airfoils in oscillating free-streams N80-17983
The aerodynamic design of an advanced rotor airfoil
[NASA-CR-2961] N80-17969
Rotors in forward flight and dynamic stall
[AAAF-NT-79-20] N80-18050
ROTATING DISKS
Experimental study of the stability and flow characteristics of floating liquid columns confined between rotating disks
[NASA-CR-162600] N80-18337
ROTATING FLUIDS
Convection in rotating layers with thermal winds and application to Jupiter N80-19012
ROTATING STALLS
Rotors in forward flight and dynamic stall
[AAAF-NT-79-20] N80-18050
ROTOR AERODYNAMICS
Numerical calculation of steady inviscid full potential compressible flow about wind turbine blades
[NASA-TM-81438] N80-18497
ROTOR BLADES (TURBOMACHINERY)
Flutter analysis of small windturbine, designed for manufacture and use in developing countries
[UTH-LR-272] N80-18415
A contribution to nonlinear rod theory --- for rotor blade stress analysis
[NASA-TM-75734] N80-18445
ROTOR LIFT
Synthesis of rotor test data for real-time simulation
[NASA-CR-152311] N80-18029
ROTORS
Liquid metal slip ring --- aerospace environments
[NASA-CASE-LEW-12277-3] N80-18300
RUBBER
Handbook of vibration and noise control --- of rubber
[AD-A071485] N80-18410
RUBIDIUM
Excited states of rubidium populated by stepwise excitation using a rubidium lamp and/or a tunable dye laser: importance of redistribution collisions N80-18374
RUDDERS
Thrust augmented spin recovery device
[NASA-CASE-LAR-11970-2] NO3-18048
RUNWAYS
Nondestructive evaluation of airport pavements. Volume 1: Program references
[AD-A078835] N80-18051

S

SAFETY
Safety studies of lithium-sulfur dioxide cells
[AD-A078961] N80-18569
SAFETY DEVICES
Microwave power transmission beam safety system
[NASA-CASE-NPO-14224-1] N80-18287
SAFETY MANAGEMENT
Safety studies of lithium-sulfur dioxide cells
[AD-A077277] N80-18573
SALINITY
Analysis of freshwater lens formation in saline aquifers N80-18502
Remote identification of a salt water wedge through dissipative media with a monocycle radar
[AD-A076621] N80-18675
SAMPLING
Bayes sequential estimation procedures for life testing problems N80-18847
SANDS
Prediction and statistical analysis of settlements of shallow foundations on sand N80-18233
Bearing capacity of driven piles in sand N80-18237
SATELLITE ANTENNAS
A ground based phase control system for the solar power satellite. Executive summary, volume 1, phase 3
[NASA-CR-160536] N80-18560
SPS pilot signal design and power transponder analysis, volume 2, phase 3
[NASA-CR-160537] N80-18561
Analytical simulation of SPS system performance, volume 3, phase 3
[NASA-CR-160538] N80-18566
SATELLITE ATTITUDE CONTROL
Rim inertial measuring system --- to measure angular rates and linear accelerations
[NASA-CASE-LAR-12052-1] N80-18019
SATELLITE LIFETIME
MSFC solar activity predictions for satellite orbital lifetime estimation N80-18492
SATELLITE OBSERVATION
Use of satellite imagery for the derivation of the hydrogeologic characteristics of a test area in semiarid climates N80-18545
Mission and sensor concepts for coastal and ocean monitoring using spacecraft and aircraft
[NASA-TM-80103] N80-18672
SATELLITE POWER TRANSMISSION (TO EARTH)
Microwave power transmission beam safety system
[NASA-CASE-NPO-14224-1] N80-18287
SATURATION
Theory of saturation spectroscopy including collisional effects
[AD-A075830] N80-18909
SATURN (PLANET)
Saturn's magnetosphere, rings, and inner satellites
[AD-A076619] N80-19013
SATURN RINGS
Saturn's magnetosphere, rings, and inner satellites
[AD-A076619] N80-19013
SCALE MODELS
Low speed test of the aft inlet designed for a tandem fan V/STOL nacelle
[NASA-CR-159752] N80-18042
SCALING LAWS
Methods of efficiency enhancement and scaling for the gyrotron oscillator
[AD-A075133] N80-18387
SCANNERS
Electromagnetic radiation system (EMRS) for susceptibility testing
[AD-A078953] N80-18276
SCATTERING AMPLITUDE
Multi-obstacle acoustic scattering --- circular and elliptical cylinders and flat plates N80-18880
SCATTERING COEFFICIENTS
Measurement of soil moisture trends with airborne scatterometers --- Guymon, Oklahoma and Sublett, Kansas
[E80-10064] N80-18514
SCATTERING CROSS SECTIONS
Experimental and theoretical determination of the velocity dependance of the scattering cross sections in monomer-dimer noble gas collisions
[MPIS-19/1978] N80-18915
A nodal greens function method for multidimensional neutron diffusion calculations N80-18919
Particle interactions in plasmas
[INPE-1589-RPE/076] N80-18940
SCATTEROMETERS
Seasat gulf of Alaska workshop report
[NASA-CR-162463] N80-18549
SCENE ANALYSIS
Feature selection and classifier design with applications to remote sensing of mule deer N80-18505
Plant cover, soil temperature, freeze, water stress, and evapotranspiration conditions --- Rio Grande Valley, Texas
[E80-10072] N80-18521
AgRISTARS. A joint program for agriculture and resources inventory surveys through aerospace remote sensing. Development and evaluation of clustering procedures --- large area crop inventories
[E80-10079] N80-18526
Proceedings of the Image Understanding Workshop
[AD-A077568] N80-18539
SCHMIDT TELESCOPES
Astronomical activities, 1977 - 1978 --- Schmidt and infrared telescope observations
[ISBN-0-9025-5321-6] N80-18999
Current applications of Schmidt telescopes in astronomy N80-19001
SCINTILLATION
Studies of equatorial scintillation problems
[AD-A076622] N80-18272
ALTAIR observations of ionospheric irregularities and background densities
[AD-A078599] N80-18615
SEA ICE
Crystal alignments in the fast ice of arctic Alaska
[AD-A077188] N80-18541
Backscatter measurements of sea ice with a helicopter-borne scatterometer
[AD-A077614] N80-18542
SEA STATES
An automated system for numerical forecasts of tidal heights, wind-driven seas, frontal waves and swells
[KNMI-V-311] N80-18652
Oceanic wave measurement system
[NASA-CASE-MFS-23862-1] N80-18667
A summary of wave data needs and availability
[AD-A076067] N80-18674
SEA TRUTH
Satellite monitoring of sea surface pollution
[E80-10062] N80-18512
SEA WATER
Satellite monitoring of sea surface pollution
[E80-10062] N80-18512
Symposium on Dissertations on Chemical Oceanography
[AD-A078526] N80-18676
SEALERS
Adhesives: Properties, preparation, and applications, volume 2: A bibliography with abstracts
[PB80-801855] N80-18201
A study of flexible pavement crack dynamics and sealants N80-18242
SEALING
Alternative method for the evaluation of fused glass-to-metal seals
[AD-A077514] N80-18412
SEALS (STOPPERS)
Gas path seal
[NASA-CASE-NPO-12131-3] N80-18400
Seals and gaskets. A bibliography with abstracts
[PB80-802010] N80-18417
SEARCHING
Quality of decision versus depth of search on game trees N80-18982
SEASAT PROGRAM
Seasat gulf of Alaska workshop report
[NASA-CR-162463] N80-18549
SEASAT-A SATELLITE
System-design consideration for an optical correlator for the Seasat-A synthetic-aperture radar
[AD-A071358] N80-18265
SEASONS
Are severe winters preceded by an abnormal circulation pattern in the fall?
[KNMI-V-315] N80-18653
SECURITY
Task force on deterrence of air piracy
[AD-A079457] N80-18009

SEDIMENTS
Early diagenesis of trace metals in nearshore Long Island sound sediments N80-18670
SEISMIC WAVES
Internal friction and modulus in rocks at depth
[NASA-CR-160476] N80-18606
SEISMOGRAMS
Computation of synthetic seismograms by the method of characteristics --- geophysical prospecting N80-18593
SEIZURES
Application of mutual amount of information for time delay estimation --- its use in the diagnosis of epilepsy
[THT-210] N80-18714
SELECTION
On a conjecture concerning least favorable configurations in certain two-stage selection procedures
[AD-A077591] N80-18865
SELF ABSORPTION
Methodology for making a self-absorption correction to the simple copper-line-ratio technique used for arc-tunnel enthalpy measurements
[AD-A078686] N80-18055
SEMANTICS
A generalized system for application program conversion to account for database semantic changes: Design and prototype implementation N80-18745
SEMICONDUCTOR DEVICES
Optical-microwave interactions in semiconductor devices
[AD-A078538] N80-18310
A theoretical search for super-velocity semiconductors
[AD-A078719] N80-18316
Nonlinear ultrasonic parametric processes in piezoelectric semiconductors and ferroelectric insulators N80-18957
SEMICONDUCTOR LASERS
Application of tunable diode lasers as local oscillators in an infrared Heterodyne Radiometer (HR)
[NASA-CR-159121] N80-18382
SEMICONDUCTORS (MATERIALS)
Voltage feed through apparatus having reduced partial discharge
[NASA-CASE-GSC-12347-1] N80-18286
A theoretical search for super-velocity semiconductors
[AD-A078719] N80-18316
Electrochemical kinetics at metal and semiconductor surfaces: Role of interfacial energy barriers N80-18961
Semiconductor electrodes 25: The p-GaAa/heatyl viologen system. Photoelectrochemical cells and photoelectrochromic displays
[AD-A075812] N80-18965
Semiconductor electrodes 27: The p- and n-GaAs-N, N'-dimethyl-4, 4'-bipyridinium system, enhancement of hydrogen evolution on p-GaAs and stabilization of n-GaAs electrodes
[AD-A075813] N80-18966
SEPARATED FLOW
Identification of noise sources in FC centrifugal fan rotors N80-18395
SEPARATORS
Flexible formulated plastic separators for alkaline batteries
[NASA-CASE-LEW-12363-4] N80-18555
Flexible formulated plastic separators for alkaline batteries
[NASA-CASE-LEW-12363-3] N80-18556
High rate stable nickel-cadmium batteries
[AD-A078714] N80-18572
SEQUENTIAL ANALYSIS
Bayes sequential estimation procedures for life testing problems N80-18847
On the cumulants of cumulative processes
[AD-A078474] N80-18852
SERVICE LIFE
Low resistivity-high minority carrier lifetime single crystal silicon investigation
[AD-A077684] N80-18970
SERVOAMPLIFIERS
Broad-band mechanical vibration amplifier N80-18217
SET THEORY
Extreme points of certain convex subsets of log-convex functions
[AD-A077549] N80-18822
The extreme points of the set of decreasing failure rate distributions
[AD-A078774] N80-18838
Optional sampling of submartingales indexed by partially ordered sets
[AD-A077409] N80-18856
Classification of the normal subgroups of Gl sub n (R) N80-18874
SEYFERT GALAXIES
Balloon-borne observations of NGC 4511 using the MISO telescope N80-18998
SHAFTS (MACHINE ELEMENTS)
Circumferential shaft seal
[NASA-CASE-LEW-12119-2] N80-18401
SHALE OIL
The application of chromatography and ancillary techniques to the characterization of shale oil/oil shale compound classes and of organometallics N80-18125
SHAPES
The effect of particle shape of model filler on the reinforcement of elastomeric vulcanizates N80-18173
SHEAR STRAIN
Anti-plane shear fields with discontinuous deformation gradients near the tip of a crack in finite elastostatics
[AD-A076027] N80-18448
SHEAR STRENGTH
Effect of Surface Exposure Time (SET) on strength of adhesive bonds to aluminum
[AD-A077107] N80-18195
SHELL STABILITY
Utilization of 'stags' to determine knockdown factors from measured initial imperfections --- in stringer stiffened shells
[VTH-LR-275] N80-18460
SHELTERS
Finite element analysis of a statically loaded ISO tactical shelter
[AD-A075807] N80-18451
SHIP HULLS
Study on crack propagation under quasi-random loading
[DOC-XIII-876-78] N80-18431
SHOCK FRONTS
Model for the front propagation in a detonating gas
[FOA-C-20323-D6(D8)] N80-18356
SHOCK WAVE PROPAGATION
Non-uniform propagation of cylindrical shocks and detonations
[VTH-LR-264] N80-18355
Model for the front propagation in a detonating gas
[FOA-C-20323-D6(D8)] N80-18356
SHOCK WAVES
Spontaneous liquefaction in retrograde fluids under condensation shock waves
[MPIS-21/1978] N80-18351
A numerical simulation of charged particle interactions with interplanetary shock waves N80-19015
SHORT TAKEOFF AIRCRAFT
V/STOLAND avionics system flight-test data on a UH-1H helicopter
[NASA-TM-78591] N80-18047
SHROUDED TURBINES
Gas path seal
[NASA-CASE-NPO-12131-3] N80-18400
SIDE-LOOKING RADAR
Radar image simulation: A project to develop a model, define its operational constraints, validate its accuracy, and to produce sample results, volume 1 and 2 N80-18257
Backscatter measurements of sea ice with a helicopter-borne scatterometer
[AD-A077614] N80-18542
SIGNAL PROCESSING
Preliminary telemetry operations experience with the real-time combiner, 1 November 1978 to 1 November 1979 N80-18072
The use of linear prediction for the interpolation and extrapolation of missing data and data gaps prior to spectral analysis
[AD-A075515] N80-18268
Signal processing for unattended radar
[AD-A078478] N80-18278
Low power, compact charge coupled device signal processing system
[NASA-CR-3215] N80-18299
An analytic analysis of a Kalman filter and smoother
[AD-A076140] N80-18306
On-chip peripheral circuits for CCD signal processors
[AD-A076603] N80-18320
Signal signatures of topographic features using analog technology
[AD-A076110] N80-18536
A ground based phase control system for the solar power satellite. Executive summary, volume 1, phase 3
[NASA-CR-160536] N80-18560
SPS pilot signal design and power transponder analysis, volume 2, phase 3
[NASA-CR-160537] N80-18561
Multiple integral expansions for nonlinear filtering
[AD-A078490] N80-18816
Application of coherence in fan noise studies
[NASA-TP-1630] N80-18882
SIGNAL TRANSMISSION
Validation of roundtrip charged-particle calibrations derived from S- and X-band Doppler via DRVID measurements N80-18065
SIGNATURE ANALYSIS
Development of LANDSAT-based technology for crop inventories
[E80-10054] N80-18506
Devleopment of LANDSAT-based technology for crop inventories: Appendices
[E80-10055] N80-18507
Development of mathematical techniques for the analysis of remote sensing data
[E80-10056] N80-18508
Large Area Crop Inventory Experiment (LACIE). LACIE transition year plan for the direct estimation of wheat from LANDSAT imagery --- North Dakota
[E80-10059] N80-18510
Measurement of soil moisture trends with airborne scatterometers --- Guymon, Oklahoma and Sublett, Kansas
[E80-10064] N80-18514
Large Area Crop Inventory Experiment (LACIE). Bibliographic addenda, technical reports, papers, and memorandums published under supporting research and technology and other research, test, and evaluation contracts for the Earth observations division
[E80-10070] N80-18519
AgRISTARS: A joint program for agriculture and resources inventory surveys through aerospace remote sensing. Development and evaluation of clustering procedures --- large area crop inventories
[E80-10079] N80-18526
Signal signatures of topographic features using analog technology
[AD-A076110] N80-18536
SILANES
Functional group selective high performance liquid chromatographic stationary phases N80-18117
SILICATES
Silicate minerals at pressure: Crystal structures and elasticity N80-18952
SILICON
Method of producing silicon --- gas phase reactor multiple injector liquid feed system
[NASA-CASE-NPO-14382-1] N80-18231
An X-band array antenna module with Si-IMPATT diode amplifier. Volume 1: Text
[FOA-C-30154-E1-VOL-1] N80-18280
An X-band array antenna module with Si-IMPATT diode amplifier. Volume 2: Figures and tables
[FOA-C-30154-E1-VOL-2] N80-18281
Stopping power measurement in the 20-150 KeV region using thick target back-scattering: 1H and 4He on carbon, silicon and gold N80-18900
Deep level transient spectroscopy studies of radiation inducing defects in silicon N80-18963
Low resistivity-high minority carrier lifetime single crystal silicon investigation
[AD-A077684] N80-18970
SILICON CARBIDES
Wear particles of single-crystal silicon carbide in vacuum
[NASA-TP-1624] N80-18178

SILICON DIOXIDE
Final evaluation of rain erosion on sled test results at Mach 3.7 to 5.0 for slip-cast fused silica radome structures
[AD-A077348] N80-18113
Process variable dependence and interrelationship between avalanche injected and radiation induced carrier trapping in thermal oxides
[AD-A078362] N80-18303
Ultraviolet spectroscopy of electron trapping centers in thermally grown SiO films N80-18955

SILICON NITRIDES
Reaction bonded silicon nitride prepared from wet attrition-milled silicon --- fractography
[NASA-TM-81428] N80-18181
Carbon impurity effect on the thermal degradation of a Si3N4-Y2O3 ceramic
[AD-A075138] N80-18190

SILOXANES
Fluoroalkyl siloxanes as liquid-repellent fabric finishes. Part 1: A state-of-the-art review and synthesis of the monomers
[AD-A073149] N80-18184
Fluoroalkyl siloxanes as liquid-repellent fabric finishes. Part 2: The homopolymers and their copolymers with alkyl silanes
[AD-A073150] N80-18185

SILVER
Silver cells, volume 1. Citations from the NTIS data base
[PB80-802309] N80-18580
Silver cells, volume 2. Citations from the NTIS data base
[PB80-802317] N80-18581
Silver cells. Citations from the Engineering Index data base
[PB80-802325] N80-18582

SIMILARITY THEOREM
Similarity measures on binary attribute data
[AD-A077627] N80-18855

SIMULATION
Analysis of future event set algorithms for discrete event simulation N80-18743

SINGLE CRYSTALS
Anelastic studies of interstitially trapped hydrogen in niobium N80-18151
Charged dislocation in ice. 1: Existence and charge density measurement by X-ray topography
[AD-A078775] N80-18540
Silicate minerals at pressure: Crystal structures and elasticity N80-18952
Low resistivity-high minority carrier lifetime single crystal silicon investigation
[AD-A077684] N80-18970

SINGULARITY (MATHEMATICS)
Imperfect bifurcation and Banach space singularity theory
[CTH-MATH-1979-12] N80-18843

SIZE (DIMENSIONS)
Size and luminance discrimination in the peripheral visual field
[MRL-R-760] N80-18703

SKIDDING
Texturing of concrete pavements
[PB80-106032] N80-18250

SKY RADIATION
Aircraft program for target background, and sky radiance measurements
[AD-A076959] N80-18624

SKYLAB PROGRAM
Induced radioactivity in recovered Skylab materials --- gamma ray spectra
[NASA-TM-78263] N80-18904

SLEDS
Final evaluation of rain erosion on sled test results at Mach 3.7 to 5.0 for slip-cast fused silica radome structures
[AD-A077348] N80-18113

SLICING
Method and apparatus for slicing crystals
[NASA-CASE-GSC-12291-1] N80-18951

SLIDING FRICTION
The role of the micro environment on the tribological behavior of materials
[NASA-TM-81434] N80-18245

SNOW
Experimental use of electronic direction finding indicators in snow removal
[VTI-130] N80-18413
Mass balance and aspects of the glacier environment, Front Range, Colorado, 1969-1973 N80-18501
Application of HCMM data to soil moisture snow and estuarine current studies
[E80-10068] N80-18517

SODIUM HYDROXIDES
Engineering evaluation of a sodium hydroxide thermal enegy storage module
[NASA-TM-81417] N80-18563

SODIUM VAPOR
Method of producing silicon --- gas phase reactor multiple injector liquid feed system
[NASA-CASE-NPO-14382-1] N80-18231
A microcomputer control system for the Urbana sodium lidar
[UILU-ENG-79-2507] N80-18378

SOIL MAPPING
Plant cover, soil temperature, freeze, water stress, and evapotranspiration conditions --- Rio Grande Valley, Texas
[E80-10072] N80-18521
Continuation of measurement of hydrologic soil-cover complex with airborne scatterometers --- Texas
[E80-10073] N80-18522
HCMM energy budget data as a model input for assessing regions of high potential groundwater pollution --- Big Sioux River Basin, SOuth Dakota
[E80-10075] N80-18524
Effect of soil texture on the microwave emission from soils
[NASA-TM-80632] N80-18530

SOIL MECHANICS
Prediction and statistical analysis of settlements of shallow foundations on sand N80-18233
Bearing capacity of driven piles in sand N80-18237

SOIL MOISTURE
Correlation of spacecraft passive microwave system data with soil moisture indices (API) --- Southern Great Plains States: Oklahoma and Kansas
[E80-10063] N80-18513
Measurement of soil moisture trends with airborne scatterometers --- Guymon, Oklahoma and Sublett, Kansas
[E80-10064] N80-18514
HCMM: Soil moisture in relation to geologic structure and lithology, northern California
[E80-10067] N80-18516
Application of HCMM data to soil moisture snow and estuarine current studies
[E80-10068] N80-18517
Dryland pasture and crop conditons as seen by HCMM --- Colby, Kansas and the Washita River watershed near Chickasha, Oklahoma
[E80-10074] N80-18523
HCMM energy budget data as a model input for assessing regions of high potential groundwater pollution --- Big Sioux River Basin, SOuth Dakota
[E80-10075] N80-18524
Application of statistical correlation in the study of available water in layers of Cerrado soil
[INPE-1607-TDL/014] N80-18531
Estimation of effective hydrologic properties of soils from observations of vegetation density --- water balance of watersheds in Clinton, Maine and Santa Paula, California
[NASA-CR-162797] N80-18534
Use of satellite imagery for the derivation of the hydrogeologic characteristics of a test area in semiarid climates N80-18545

SOLAR ACTIVITY
Solar-Terrestrial Predictions Proceedings. Volume 1: Prediction group reports
[NASA-CR-162794] N80-18462
The forecasting center of Meudon, France --- solar activity forecasting N80-18463
The French short term radiopropagation predictions in the decameter band N80-18464
KAZIA: A computer system for solar-terrestrial data processing and objective prediction N80-18467
Soviet short-term forecasts of active region evolution and flare activity N80-18469
Long term solar activity and ionospheric prediction services rendered by the National Physical Laboratory, New Delhi N80-18472
Spiral sunspots and solar activity forecasts N80-18474
Solar activity predictions at Peking Observatory N80-18475
Long-term forecasting of solar activity N80-18476
Short-term solar activity forecasting N80-18477
A review of short-term flare forecasting activities at Toyokawa N80-18479
A disturbance forecaster's view of the September 1977 events N80-18483
Predictions of the Space Environment Services Center N80-18489
MSFC solar activity predictions for satellite orbital lifetime estimation N80-18492

SOLAR ACTIVITY EFFECTS
A method of predictions geomagnetic activity based on a coronal model of relations between solar and geomagnetic activities N80-18466
Estimation of solar flame influence on radio circuit transmission loss N80-18468
Forecasts of geomagnetic activity by Ottawa Magnetic Observatory: Their reliabilty and application N80-18494
A numerical simulation of charged particle interactions with interplanetary shock waves N80-19015

SOLAR ARRAYS
Economic analysis of the design and fabrication of a space qualified power system
[NASA-TM-81418] N80-18098
Experimental results on plasma interactions with large surfaces at high voltages
[NASA-TM-81423] N80-18946

SOLAR CELLS
Driver for solar cell I-V characteristic plots
[NASA-CASE-NPO-14096-1] N80-18551
Solar cell angular position transducer
[NASA-CASE-LAR-11999-1] N80-18552
Development of improved wraparound contacts for silicon
[NASA-CR-159748] N80-18554
Low resistivity-high minority carrier lifetime single crystal silicon investigation
[AD-A077684] N80-18970

SOLAR COLLECTORS
Preliminary study of a solar selective coating system using black cobalt oxide for high temperature solar collectors
[NASA-TM-81385] N80-18156
Solar energy design improvement: A methodology for hydronic flatplate collector systems
[AD-A076836] N80-18567

SOLAR CYCLES
Long-term forecasting of solar activity N80-18476

SOLAR ELECTRIC PROPULSION
Feasibility study of a spacecraft surveillance system --- International Comet Exploration spacecraft solar electric propulsion stage N80-18067

SOLAR ENERGY
European scientific notes, volume 33, no.7 --- airships, electric batteries, oceanography and fluid dynamics
[AD-A075097] N80-19019

SOLAR FLARES
Estimation of solar flame influence on radio circuit transmission loss N80-18468
Examples of problem flares or situations in past solar-terrestrial observations N80-18493
La Posta solar radio maps
[AD-A076376] N80-19017

SOLAR MAGNETIC FIELD
The forecasting center of Meudon, France --- solar activity forecasting N80-18463
Soviet short-term forecasts of active region evolution and flare activity N80-18469
Forecasting of solar energetic radiation at the forecast center of the Institute of Applied Geophysics N80-18470
Sunspot vector magnetic fields and model umbral atmospheres N80-19016

SOLAR OBSERVATORIES
Short-term solar activity forecasting N80-18477
Forecasts of geomagnetic activities and HF radio propagation conditions made at Hiraiso/Japan N80-18478
A review of short-term flare forecasting activities at Toyokawa N80-18479

SOLAR POWER SATELLITES
A ground based phase control system for the solar power satellite. Executive summary, volume 1, phase 3
[NASA-CR-160536] N80-18560

SPS pilot signal design and power transponder analysis, volume 2, phase 3
[NASA-CR-160537] N80-18561
Analytical simulation of SPS system performance, volume 3, phase 3
[NASA-CR-160538] N80-18566

SOLAR PROTONS
ELF SFERIC occurrences in the Antarctic during a solar proton event case study of occurences at Byrd Station during the event 9 June 1968
[AD-A078923] N80-18270
PPS76: A computerized event mode solar proton forecasting technique N80-18495

SOLAR RADIATION
Analytical and experimental investigation of the effect of dyes on solar distillation N80-18328
Tunable diode laser heterodyne radiometer measurement of atmospheric absorption of solar radiation
[NASA-CR-162827] N80-18383
Forecasting of solar energetic radiation at the forecast center of the Institute of Applied Geophysics N80-18470
Solar radiation test
[AD-A075734] N80-19018

SOLAR RADIO EMISSION
Coronal holes inferred from the Fleurs East-West solar scans N80-18487

SOLAR SPECTRA
Coronal holes inferred from the Fleurs East-West solar scans N80-18487

SOLAR SYSTEM
An assessment of ground-based techniques for detecting other planetary systems. Volume 1: An overview --- workshop conclusions
[NASA-CP-2124] N80-18997

SOLAR TERRESTRIAL INTERACTIONS
Solar-Terrestrial Predictions Proceedings. Volume 1: Prediction group reports
[NASA-CR-162794] N80-18462
Propagation predictions for the HF-range by the Research Institute of the Deutsche Bundespost --- predictions based on reliable sunspot number and solar-terrestrial data N80-18465
A method of predictions geomagnetic activity based on a coronal model of relations between solar and geomagnetic activities N80-18466
KAZIA: A computer system for solar-terrestrial data processing and objective prediction N80-18467
Radio disturbance warning issuance system N80-18481
A weekly ionospheric index N80-18486
PROPHET: An applicaton of propagation forecasting principles N80-18488
Predictions of the Space Environment Services Center N80-18489
Geophysical forecasting at AFGWC --- aerospace environments N80-18490

SOLID PROPELLANT ROCKET ENGINES
Comparison of ablative materials in a solid rocket motor flow field
[AD-A075507] N80-18099
Calculation of attach point loads due to possible combustion instability in the space shuttle solid rocket boosters N80-18230

SOLID PROPELLANTS
An investigation of particle size distribution using laser holography of burning solid propellant
[AD-A078904] N80-18210

SOLID ROCKET PROPELLANTS
Propellant surveillance report LGM-30, A, B, F, G, stage 1, TP-H1043 AFT closure propellant --- minuteman missiles
[AD-A078778] N80-18207
Propellant surveillance report LGM-30 F & G stage 1, phase E, series 8, TP-H1011
[AD-A078777] N80-18208
The fire environment of a solid rocket propellant burning in air
[AD-A076941] N80-18209

SOLID STATE DEVICES
Silver cells. Citations from the Engineering Index data base
[PB80-802325] N80-18582
Solid state research
[AD-A078676] N80-18972

SOLIDIFICATION
Application of solidification theory to rapid solidification processing
[AD-A076947] N80-18165
Laser melting and subsequent solidification of a surface layer --- heat flux N80-18375

SOLITARY WAVES
Multiphase averaging of periodic soliton equations N80-18802

SOLITHANES
Long-term thermal stability of solithane, a candidate TWT encapsulant
[AD-A078832] N80-18187

SOLUTES
Functional group selective high performance liquid chromatographic stationary phases N80-18117

SOLVENTS
Specific solvent interactions and stress induced crystallinity in polymers N80-18176
Environmental stress cracking of polymers
[NASA-CR-162825] N80-18182
High solids coating systems --- air pollution
[AD-A076433] N80-18193

SOUND PROPAGATION
Analysis of acoustic variations in the ocean produced by combined environmental effects --- mathematical model of variations in sound propagation due to ocean currents N80-18879

SOUND RANGING
Atmospheric effects on the speed of sound
[AD-A076060] N80-18885

SOUND TRANSMISSION
Some basic aspects of oceanic internal waves and the sound-speed fluctuations they generate
[AD-A077537] N80-18677

SOUND WAVES
The generation of a Tollmien-Schlichting wave by a sound wave
[AD-A075816] N80-18886
Transient acoustic radiation from elastic plates
[AD-A076772] N80-18887

SOUTH DAKOTA
HCMM energy budget data as a model input for assessing regions of high potential groundwater pollution --- Big Sioux River Basin, SOuth Dakota
[E80-10075] N80-18524

SOYBEANS
Large Area Crop Inventory Experiment (LACIE). Evaluation of three-category classification
[E80-10058] N80-18509
Implementation of Badhwar classification of corn/soybean segments --- Illinois, Indiana, Iowa, and Missouri
[E80-10060] N80-18511

SPACE COMMUNICATION
The deep space network
[NASA-CR-162795] N80-18058
Network functions and facilities N80-18059

SPACE DEBRIS
Induced radioactivity in recovered Skylab materials --- gamma ray spectra
[NASA-TM-78263] N80-18904

SPACE ENVIRONMENT SIMULATION
Some experience with arc-heater simulation of outer planet entry radiation
[NASA-TM-80192] N80-18047

SPACE ERECTABLE STRUCTURES
Technology for large space systems. A special bibliography with indexes, supplement 2
[NASA-SP-7046(02)] N80-18056

SPACE FLIGHT
The cosmos today and tomorrow
[NASA-TM-75736] N80-19010

SPACE NAVIGATION
An evaluation criteria model for the navigation network system design N80-18069

SPACE SHUTTLE BOOSTERS
Calculation of attach point loads due to possible combustion instability in the space shuttle solid rocket boosters N80-18230

SPACE SHUTTLE ORBITERS
Orbiter subsystem hardware/software interaction analysis. Volume 8: Forward reaction control system
[NASA-TM-80959] N80-18088
Orbiter subsystem hardware/software interaction analysis. Volume 8: AFT reaction control system, part 2
[NASA-TM-80960] N80-18089
Nightime/daytime optical survey of lightning and convective phenomena experiment (NOSL)
[NASA-TM-78261] N80-18608
STS mission duration enhancement study: (orbiter habitability)
[NASA-CR-160535] N80-18718

SPACE SHUTTLES
Space shuttle 1980
[GPO-55-916] N80-18086
Program documentation for the data noising program
[NASA-CR-160534] N80-18087
Automatic thermal switch --- Space Shuttle equipment bay temperature control
[NASA-CASE-GSC-12415-1] N80-18338
Infrared scanner concept verification test report
[NASA-TM-78264] N80-18367
Control system designs for the shuttle infrared telescope facility
[NASA-TM-81159] N80-18869

SPACE SURVEILLANCE (GROUND BASED)
Feasibility sturly of a spacecraft surveillance system --- International Comet Exploration spacecraft solar electric propulsion stage N80-18067

SPACE TRANSPORTATION SYSTEM
STS mission duration enhancement study: (orbiter habitability)
[NASA-CR-160535] N80-18718

SPACE TRANSPORTATION SYSTEM FLIGHTS
Program documentation for the data noising program
[NASA-CR-160534] N80-18087
Shuttle Global Positioning (GPS) System design study
[NASA-CR-160539] N80-18090

SPACE TRANSPORTATION SYSTEM 2 FLIGHT
Nightime/daytime optical survey of lightning and convective phenomena experiment (NOSL)
[NASA-TM-78261] N80-18608

SPACEBORNE EXPERIMENTS
Absorption data analysis for EUVS experiment of the satellites AE-C, D and E
[AD-A078663] N80-18621

SPACEBORNE TELESCOPES
Control system designs for the shuttle infrared telescope facility
[NASA-TM-81159] N80-18869

SPACECRAFT ANTENNAS
Shuttle Global Positioning (GPS) System design study
[NASA-CR-160539] N80-18090

SPACECRAFT CHARGING
NASCAP modelling computations on large optics spacecraft in geosynchronous substorm environments
[NASA-TM-81395] N80-18095

SPACECRAFT COMMUNICATION
Stimulated-Emission-of-Energetic-Particles (SEEP) experiment
[AD-A075503] N80-18269
The sensitivity of satellite communications to the uncertainties in selected chemical reaction rate coefficients
[AD-A078924] N80-18279

SPACECRAFT CONSTRUCTION MATERIALS
Induced radioactivity in recovered Skylab materials --- gamma ray spectra
[NASA-TM-78263] N80-18904

SPACECRAFT CONTAMINATION
NASCAP modelling computations on large optics spacecraft in geosynchronous substorm environments
[NASA-TM-81395] N80-18095

SPACECRAFT ENVIRONMENTS
STS mission duration enhancement study: (orbiter habitability)
[NASA-CR-160535] N80-18718

SPACECRAFT INSTRUMENTS
Distributed-switch Dicke radiometers
[NASA-CASE-GSC-12219-1] N80-18359

SPACECRAFT MANEUVERS
GEOS-2: Report on the first six months of routine operations N80-18077

SPACECRAFT POWER SUPPLIES
Economic analysis of the design and fabrication of a space qualified power system
[NASA-TM-81418] N80-18098

SPACECRAFT STRUCTURES
Technology for large space systems. A special bibliography with indexes, supplement 2
[NASA-SP-7046(02)] N80-18056

SPACECRAFT TRACKING
The deep space network
[NASA-CR-162795] N80-18058
Network functions and facilities N80-18059
Viking orbiter completion mission N80-18060
Pioneer mission support N80-18061
Estimating the angular position of a moving deep space vehicle using two rotating tracking stations N80-18064
Feasibility study of a spacecraft surveillance system --- International Comet Exploration spacecraft solar electric propulsion stage N80-18067

SPALLING
Wear particles of single-crystal silicon carbide in vacuum
[NASA-TP-1624] N80-18178

SPANLOADER AIRCRAFT
Effect of sweep and aspect ratio on the longitudinal aerodynamics of a spanloader wing in- and out-of-ground effect --- conducted in Langley V/STOL wind tunnel
[NASA-TM-80199] N80-17993

SPARK CHAMBERS
Laser measuring system for incremental assemblies --- measuring wire-wrapped frame assemblies in spark chambers
[NASA-CASE-GSC-12321-1] N80-18380

SPARK GAPS
The influence on spark machining efficiency of the technique for inducing dielectric circulation between the work material and the electrode
[CETIM-13-G-03-0] N80-18246
Studies of transient discharges
[AD-A078894] N80-18318

SPARK IGNITION
Combustion simulation of a dual chamber stratified charge spark ignition engine N80-18394

SPARK MACHINING
The influence on spark machining efficiency of the technique for inducing dielectric circulation between the work material and the electrode
[CETIM-13-G-03-0] N80-18246

SPATIAL DISTRIBUTION
A hybrid method for the solution of some multi-commodity spatial equilibrium problems
[AD-A078514] N80-18871

SPECKLE PATTERNS
Studies in one beam laser speckle interferometry N80-18376

SPECTRAL LINE WIDTH
Methodology for making a self-absorption correction to the simple copper-line-ratio technique used for arc-tunnel enthalpy measurements
[AD-A078686] N80-18055

SPECTRAL REFLECTANCE
An investigation of the utility of LANDSAT 2 MSS data to the fire-danger rating area, and forest fuel analysis within Crater Lake National Park, Oregon N80-18500

SPECTRAL SIGNATURES
Development of LANDSAT-based technology for crop inventories
[E80-10054] N80-18506
Development of LANDSAT-based technology for crop inventories. Appendices
[E80-10055] N80-18507
Development of mathematical techniques for the analysis of remote sensing data
[E80-10056] N80-18508
Large Area Crop Inventory Experiment (LACIE). LACIE transition year plan for the direct estimation of wheat from LANDSAT imagery --- North Dakota
[E80-10059] N80-18510
Implementation of Badhwar classification of corn/soybean segments --- Illinois, Indiana, Iowa, and Missouri
[E80-10060] N80-18511
Large Area Crop Inventory Experiment (LACIE). Bibliographic addenda, technical reports, papers, and memorandums published under supporting research and technology and other research, test, and evaluation contracts for the Earth observations division
[E80-10070] N80-18519
Large Area Crop Inventory Experiment (LACIE). Composition and assembly of a spectral-met data base for spring and winter wheat, volume 2
[E80-10076] N80-18525
AgRISTARS. A joint program for agriculture and resources inventory surveys through aerospace remote sensing. Development and evaluation of clustering procedures --- large area crop inventories
[E80-10079] N80-18526
The easy remote sensing problem
[REPT-20] N80-18528
The Cramer-Rao lower bound as a criteria for evaluating a large data reduction system such as LACIE
[REPT-21] N80-18529
Signal signatures of topographic features using analog technology
[AD-A076110] N80-18536

SPECTROMETERS
Frequency-scanning particle size spectrometer
[NASA-CASE-NPO-13606-2] N80-18364

SPECTROSCOPIC ANALYSIS
Inelastic electron tunneling spectroscopy of UV irradiated molecules N80-18116
Spectroelectrochemical monitoring of electrode reactions by multiple specular reflectance spectroscopy
[AD-A076951] N80-18139
Time- and space-resolved spectroscopic studies of low-current nanosecond-duration spark discharges in 90% argon and 10% hydrogen at atmospheric pressure N80-18930
Deep level transient spectroscopy studies of radiation inducing defects in silicon N80-18963

SPECTROSCOPY
Applications of the Moessbauer Effect to the study of mixed-valence compounds
[AD-A077640] N80-18967

SPECTRUM ANALYSIS
The use of linear prediction for the interpolation and extrapolation of missing data and data gaps prior to spectral analysis
[AD-A075515] N80-18268
Spectral analysis of synoptic scale disturbances over the Marshall Islands region N80-18596
Balloon-borne observations of NGC 4511 using the MISO telescope N80-18998

SPECULAR REFLECTION
Spectroelectrochemical monitoring of electrode reactions by multiple specular reflectance spectroscopy
[AD-A076951] N80-18139

SPEED CONTROL
Control strategy for a variable-speed wind energy conversion system
[NASA-TM-75512] N80-18558

SPHERICAL HARMONICS
Spherical harmonic analysis of a synoptic climatology generated with a global general circulation model
[NASA-CR-162804] N80-18607

SPHERICAL SHELLS
A model of an elastic Earth by a finite element method applied to spherical shells
[SER-C/DISS-249-MITT-149] N80-18461

SPIN DYNAMICS
Spin waves in itinerant electron spin density wave states --- and the magnetic permeability
[INPE-1594-RPE/080-REV] N80-18903

SPINAL CORD
Topochemical differences in the amount of RNA in the motoneurons of the spinal chord in hypoxia and hypokinesia
[NASA-TM-75994] N80-18689

SPLEEN
Effects of gravitational stress, hypokinesia and hypodynamia on the structure of the vascular bed of the spleen
[NASA-TM-75934] N80-18711

SPLINE FUNCTIONS
On the estimation of functions of several variables from aggregated data
[AD-A077105] N80-18623

SPRAYERS
Heat, mass and momentum transfer through sprays --- cross flow N80-18327

SPRINGS (ELASTIC)
A study of some aspects of the mechanical behavior of cross-spring pivots and plate spring mechanisms with negative stiffness
[WTHD-116] N80-18416

STABILITY AUGMENTATION
A method for the transient stability enhancement of a power system using feedback control of a synchronous generator N80-18290

STABILITY DERIVATIVES
Stability considerations for Volterra integrodifferential equations N80-18792

STAINLESS STEELS
An evaluation of processes for the blackening of precipitation-hardened stainless steels
[AD-A075134] N80-18158

STANDARDS
The reciprocity calibration of vibration standards over an extended frequency range N80-18224
Verification of figure expectations --- for validating the accuracy of weather reports
[KNMI-V-298] N80-18644
Vibration injuries of the hand and arm: Their occurence and the evolution of standards and limits
[ISVR-TR-101] N80-18713

STATE VECTORS
Optimal control problems with discrete time, linear dynamics, and convex state-control constraints
[VTT-ENT-26] N80-18791

STATIC LOADS
Fatigue behavior of nodular iron under combined static and dynamic multiaxial stresses
[LBF-FB-149] N80-18442
Finite element analysis of a statically loaded ISO tactical shelter
[AD-A075807] N80-18451

STATIC PRESSURE
Static pressure orifice system testing method and apparatus
[NASA-CASE-LAR-12269-1] N80-18358

STATISTICAL ANALYSIS
Prediction and statistical analysis of settlements of shallow foundations on sand N80-18233
Statistical evaluation of fatigue lives at and near fatigue limit for notched specimens of steel and their life distributions --- fatigue cracks
[ICAF-1131] N80-18434
Short-term solar activity forecasting N80-18477
The Cramer-Rao lower bound as a criteria for evaluating a large data reduction system such as LACIE
[REPT-21] N80-18529
Significant results from a project on agricultural statistics, 1975 - 1978
[INPE-1609-NTE/155] N80-18532
Statistical methods of probable use for understanding remote sensing data --- estimating ice pressure ridge characteristics
[AD-A076908] N80-18535
Second-order statistics of texture primitives
[AD-A077390] N80-18772
The role of exchangeability in inference
[AD-A077378] N80-18857
Rank weighting in multiattribute utility decision making: Avoiding the pitfalls of equal weights
[AD-A078941] N80-18858
A weighted dispersion function for estimation in linear models
[AD-A077654] N80-18860

STATISTICAL CORRELATION
Application of statistical correlation in the study of available water in layers of Cerrado soil
[INPE-1607-TDL/014] N80-18531

STATISTICAL DECISION THEORY
On a conjecture concerning least favorable configurations in certain two-stage selection procedures
[AD-A077591] N80-18865
Some recent developments in multiple decision theory: A brief overview
[AD-A077710] N80-18980

STATISTICAL DISTRIBUTIONS
A weighted dispersion function for estimation in linear models
[AD-A077654] N80-18860
On a conjecture concerning least favorable configurations in certain two-stage selection procedures
[AD-A077591] N80-18865
Logistic discriminant analysis
[KNMI-V-310] N80-18868

STATISTICAL MECHANICS
A functional approach to the statistical mechanics of fluid particles in turbulence N80-18325

STATISTICAL TESTS
Asymptotic inference for eigenvectors
[AD-A078960] N80-18834
The asymptotic distribution of mortality rates in competing risks analyses
[AD-A078948] N80-18859
Convergence of the conditional distribution of the maximum likelihood estimate, given latent trait, to the asymptotic normality: Observations made through the constant information model
[AD-A077706] N80-18861
Maximum likelihood estimation of a distribution function with monotone failure rate based on censored observations
[AD-A077459] N80-18862
A Bayesian nonparametric estimator of survival probability assuming increasing failure rate
[AD-A077458] N80-18863
STATISTICAL WEATHER FORECASTING
The relation between the quality of the week long forecast and the quality of the currently used GWL forecast
[KNMI-V-297] N80-18643
Verification of figure expectations --- for validating the accuracy of weather reports
[KNMI-V-298] N80-18644
Results from establishing short term weather forecasts based on method of analogies
[KNMI-V-301] N80-18646
Logistic discriminant analysis
[KNMI-V-310] N80-18868
STATORS
Liquid metal slip ring --- aerospace environments
[NASA-CASE-LEW-12277-3] N80-18300
STEADY STATE
Steady-state and time-dependent behavior of fusion-fission hybrid systems N80-18935
STEELS
Fatigue crack growth of A508 steel in high-temperature, pressurized reactor-grade water
[AD-A075506] N80-18159
Analysis and design of steel beam-to-column web connections N80-18241
Moving body velocity arresting line --- elongating steel cable
[NASA-CASE-LAR-12372-1] N80-18399
Air pollution effects on materials. Citations from the American Petroleum Institute data base
[PB80-801871] N80-18588
Air pollution effects on materials. Citations from the NTIS data base
[PB80-801863] N80-18589
STEERING
The influence of road roughness on the braking and steering performance of cars
[VTI-134] N80-18414
STELLAR EVOLUTION
Theoretical models of stellar formation --- the stellar evolution from interstellar gas and matter to protostars N80-19006
The formation of late O and B stars within dense molecular clouds N80-19007
Evolution of pre-main-sequence binary star systems N80-19008
STELLAR MASS
An astrophysical investigation of radius and mass anomalies among short period Cepheids N80-19004
STELLAR MODELS
Synthetic stellar spectra: A library of calculation programs
[PUBL-SER-B-FASC-7] N80-19002
Theoretical models of stellar formation --- the stellar evolution from interstellar gas and matter to protostars N80-19006
Sunspot vector magnetic fields and model umbral atmospheres N80-19016
STELLAR SPECTRA
Synthetic stellar spectra: A library of calculation programs
[PUBL-SER-B-FASC-7] N80-19002
STELLAR STRUCTURE
Supergiant chromospheres N80-18996
STIFFNESS
A study of some aspects of the mechanical behavior of cross-spring pivots and plate spring mechanisms with negative stiffness
[WTHD-116] N80-18416
STILLS
Analytical and experimental investigation of the effect of dyes on solar distillation N80-18328
STIRLING CYCLE
Analysis and design of a uniform-clearance, pumping-ring rod seal for the Stirling engine
[NASA-TM-81463] N80-18408
Overview of a stirling engine test project
[NASA-TM-81442] N80-18564
STOCHASTIC PROCESSES
State estimation of linear systems driven simultaneously by Wiener and Poisson processes N80-18296
Applications of stochastic models for image data compression
[AD-A078781] N80-18758
Optimal discounted linear control of the Wiener process
[AD-A078487] N80-18778
Some properties of the dual adaptive stochastic control algorithm
[AD-A078488] N80-18779
Partially observed stochastic control systems
[AD-A078290] N80-18788
Numerical methods and approximation and modelling problems in stochastic control theory
[AD-A078288] N80-18789
A projected stochastic approximation method for adaptive filters and identifiers
[AD-A078602] N80-18812
On the weak convergence of a sequence of general Stochastic difference equations to a diffusion
[AD-A078583] N80-18851
On the cumulants of cumulative processes
[AD-A078474] N80-18852
On a stochastic control problem with exit constraints
[AD-A078372] N80-18853
The asymptotic distribution of mortality rates in competing risks analyses
[AD-A078948] N80-18859
Asymptotic measures of system performance under alternative operating rules, 2 --- failure and repair stochastic processes
[AD-A078827] N80-18870
Asymptotic measures of system performance under alternative operating rules, 1
[AD-A078826] N80-18872
STOKES THEOREM (VECTOR CALCULUS)
Sunspot vector magnetic fields and model umbral atmospheres N80-19016
STOPPING
Countable state average cost regenerative stopping problems
[AD-A078509] N80-18781
STOPPING POWER
Stopping power measurement in the 20-150 KeV region using thick target back-scattering: 1H and 4He on carbon, silicon and gold N80-18900
STORAGE BATTERIES
Aromatic ions as anode materials for rechargeable, ambient-temperature batteries
[AD-A078697] N80-18571
Analysis of pressure producing reactions in lithium-sulfur dioxide cells
[AD-A077379] N80-18574
Lithium-thionyl chloride battery
[AD-A077162] N80-18575
Calcium inorganic electrolyte battery development
[AD-A077685] N80-18576
Silver cells, volume 1. Citations from the NTIS data base
[PB80-802309] N80-18580
Silver cells, volume 2. Citations from the NTIS data base
[PB80-802317] N80-18581
Silver cells. Citations from the Engineering Index data base
[PB80-802325] N80-18582
STORAGE STABILITY
Hydrogen as a fuel --- automobiles
[TT-7903] N80-18212
STORAGE TANKS
Cryogenic container compound suspension strap
[NASA-CASE-ARC-11157-1] N80-18393
STORMS (METEOROLOGY)
A preliminary look at AVE-SESAME 1 conducted on 10-11 April 1979
[NASA-TM-78262] N80-18636
STRAIN GAGES
Specification for the installation of electrical resistance strain gauges on strain pairs counter aircraft --- to monitor fatigue damage
[AD-A071363] N80-18369
Fatigue Measuring Gauges (FMG): A new system for monitoring fatigue loads N80-18443
STRAPS
Cryogenic container compound suspension strap
[NASA-CASE-ARC-11157-1] N80-18393
STRESS (PHYSIOLOGY)
Effect of the enzymatic inhibitor of Kunitz on the gastric lesions from reserpine, from phenylbutazone, from pyloric ligation and by restraint in the rat
[NASA-TM-76027] N80-18681
Effect of restricted motion in high temperature on enzymatic activity of the pancreas
[NASA-TM-76063] N80-18683
Effect of consecutive cooling and immobilization on catecholamine metabolism in rat tissues
[NASA-TM-75962] N80-18684
The effects of adrenalectomy and corticsteroid injection on the fibrinolytic activity of complex heparin compounds in the blood during immobilization
[NASA-TM-75985] N80-18685
Influence of ambient temperatures on the production of restraint ulcers in the rat
[NASA-TM-76028] N80-18686
Features of cholinergic cardia regulation under conditions of hypokinesia
[NASA-TM-76044] N80-18687
Experimental investigation of the role of thyrocalcitonin in the prophylaxis of disturbances in the water-salt and mineral metabolism during a 30-day hypokinesia
[NASA-TM-75938] N80-18704
Restraint ulcers in the rat. 1: Influence on ulcer frequency of fasting and of environmental temperature associated with immobilization of varying durations
[NASA-TM-76031] N80-18705
Hormone supply of the organism in prolonged emotional stress
[NASA-TM-76046] N80-18706
Physiologic reactions during five weeks of continuous residence in an artificial humid and hot climate
[NASA-TM-75356] N80-18707
Effect of hypokinesia on contractile function of cardiac muscle
[NASA-TM-76061] N80-18708
Effects of gravitational stress, hypokinesia and hypodynamia on the structure of the vascular bed of the spleen
[NASA-TM-75934] N80-18711
STRESS (PSYCHOLOGY)
Hormone supply of the organism in prolonged emotional stress
[NASA-TM-76046] N80-18706
STRESS ANALYSIS
Mixed-mode fracture analysis using a conservation integral N80-18423
Stress analysis and buckling of J-stiffened graphite-epoxy panel
[NASA-TP-1607] N80-18427
Stress intensity factors in two bonded elastic layers containing cracks perpendicular to and on the interface. Part 1: Analysis
[NASA-CR-159218] N80-18428
Stress intensity factors in two bonded elastic layers containing cracks perpendicular to and on the interface. Part 2: Solution and results
[NASA-CR-159219] N80-18429
Separation of prestressed-time functions after their beginning N80-18444
Fatigue crack growth in lugs and the stress intensity factor
[VTH-LR-273] N80-18459
STRESS CONCENTRATION
Boundary integral equation solution of plane elasticity problems with high stress concentrations N80-18425
Fracture mechanics in Japan
[ICAF-1123] N80-18430
STRESS CORROSION CRACKING
Environmental stress cracking of polymers
[NASA-CR-162825] N80-18182
STRESS MEASUREMENT
Local residual stress near fatigue crack tip --- X-ray diffraction measurement technique
[ICAF-1129] N80-18433

STRESS TENSORS
Study and torsion testing of composite materials in the form of bars having rectangular cross-sections
[RR-094] N80-18200
STRESS-STRAIN RELATIONSHIPS
Pavement distress, evaluation, and performance
[PB80-101991] N80-18249
STRESS-STRAIN-TIME RELATIONS
Separation of prestressed-time functions after their beginning N80-18444
A Stress-Strain-Time model (SST) for high-temperature, low-cycle fatigue
[AD-A078829] N80-18454
STRIP MINING
Control of vibration and blast noise from surface coal mining, volume 1
[PB-299887/0] N80-18993
Control of vibration and blast noise from surface coal mining, volume 2
[PB-299888/8] N80-18994
STRUCTURAL ANALYSIS
Calculation of attach point loads due to possible combustion instability in the space shuttle solid rocket boosters N80-18230
Resilient based flexible pavement design procedure for secondary roads N80-18234
Experimental study of frame-wall interaction in reinforced concrete structures subjected to strong earthquake motions N80-18239
Analysis and design of steel beam-to-column web connections N80-18241
Longitudinal joint systems in slip-formed rigid pavements. Volume 3: User's manual --- structural analysis
[AD-A078850] N80-18243
Finite element analysis of a statically loaded ISO tactical shelter
[AD-A075807] N80-18451
Bending strength of vertically glued laminated beams with one to five plies
[AD-A077173] N80-18456
STRUCTURAL BASINS
HCMM: Soil moisture in relation to geologic structure and lithology, northern California
[E80-10067] N80-18516
STRUCTURAL DESIGN
The aerodynamic design of an advanced rotor airfoil
[NASA-CR-2961] N80-17989
Design and test of a boron - aluminum high temperature wing
[AD-A075814] N80-18034
Advanced composite aileron for L-1011 transport aircraft
[NASA-CR-162863] N80-18103
Resilient based flexible pavement design procedure for secondary roads N80-18234
A study of local minima in structural design N80-18236
Cost minimization calculations for plane and three dimensional frame structures
[ILR-39] N80-18247
Solar energy design improvement: A methodology for hydronic flatplate collector systems
[AD-A076836] N80-18567
STRUCTURAL DESIGN CRITERIA
The aerodynamic design of an advanced rotor airfoil
[NASA-CR-2961] N80-17989
The effects of spray entrainment on the mean wind profile and the overall load on marine structures N80-18335
Gimbal pickoff technological studies
[AD-A076372] N80-18370
STRUCTURAL ENGINEERING
Research and pedagogy in noise and vibration control N80-19020
STRUCTURAL PROPERTIES (GEOLOGY)
HCMM: Soil moisture in relation to geologic structure and lithology, northern California
[E80-10067] N80-18516
STRUCTURAL STABILITY
Resistance of reinforced concrete structures under high intensity loads --- nuclear detonations N80-18235
STRUCTURAL STRAIN
Separation of prestressed-time functions after their beginning N80-18444
A review of Australian investigations on aeronautical fatigue during the period April 1977 to March 1979 --- structural strain and fatigue life studies on aircraft structures and construction materials
[AD-A071641] N80-18449
STRUCTURAL VIBRATION
Turbulent-boundary-layer excitation and response thereto for a high-performance conical vehicle --- reentry N80-18229
STYRENES
Styrene-butadiene copolymerization in organolithium systems N80-18174
Variable temperature 119M SN Moessbauer study of organotin - substituted styrene monomers and polymers
[AD-A075958] N80-18188
SUBGROUPS
Classification of the normal subgroups of Gl sub n (R) N80-18874
SUBMERGING
Liquid-immersible electrostatic ultrasonic transducer
[NASA-CASE-LAR-12465-1] N80-18363
SUBROUTINE LIBRARIES (COMPUTERS)
Synthetic stellar spectra: A library of calculation programs
[PUBL-SER-B-FASC-7] N80-19002
SUBSONIC FLOW
Unsteady effects with control surfaces --- measured in a wind tunnel
[AAAF-NT-79-01] N80-18049
SUCTION
Boundary layer control by means of suction
[NASA-TM-75502] N80-17987
SULFATES
Ensemble trajectory analysis of summertime sulfate aerosol concentrations in the northeastern United States N80-18584
SULFUR
Negative ion charge transfer of the reaction of S- and O- with atomic hydrogen producing H- ions from 1500 to 10 KeV N80-18892
SULFUR DIOXIDES
Safety studies of lithium-sulfur dioxide cells
[AD-A077277] N80-18573
Analysis of pressure producing reactions in lithium-sulfur dioxide cells
[AD-A077379] N80-18574
SUN
La Posta solar radio maps
[AD-A076376] N80-19017
SUNSPOTS
Propagation predictions for the HF-range by the Research Institute of the Deutsche Bundespost --- predictions based on reliable sunspot number and solar-terrestrial data N80-18465
Spiral sunspots and solar activity forecasts N80-18474
Sunspot vector magnetic fields and model umbral atmospheres N80-19016
SUPERCONDUCTING POWER TRANSMISSION
Permanent magnet and superconducting generators in airborne, high power systems --- computer program to predict weight of the generators and component systems
[AD-A078424] N80-18311
SUPERCONDUCTIVITY
On the synthesis of metastable A-15 Nb3Si by ion implantation and on its superconducting transition temperature
[AD-A077396] N80-18135
SUPERCONDUCTORS
No-load testing of the shaped field superconductive motor
[AD-A076125] N80-18308
SUPERCRITICAL PRESSURES
Laminar free convective heat transfer in the supercritical region with variable fluid properties N80-18330
SUPERGIANT STARS
Supergiant chromospheres N80-18996
SUPERHIGH FREQUENCIES
An X-band array antenna module with Si-IMPATT diode amplifier. Volume 1: Text
[FOA-C-30154-E1-VOL-1] N80-18280
An X-band array antenna module with Si-IMPATT diode amplifier. Volume 2: Figures and tables
[FOA-C-30154-E1-VOL-2] N80-18281
An X-band array antenna module with GaAs IMPATT diode amplifier. Volume 1: Text
[FOA-C-30155-E1-VOL-1] N80-18282
An X-band array antenna module with GaAs IMPATT diode amplifier. Volume 2: Figures and tables
[FOA-C-30155-E1-VOL-2] N80-18283
SUPERPLASTICITY
Utilization of superplasticity in industrial metal forming
[NRC/CNR-TT-1946] N80-18153
SUPERSONIC FLOW
The influence of a high pressure gradient on unsteady velocity perturbations in the case of a turbulent supersonic flow
[AAAF-NT-79-10] N80-18348
SUPERSONIC JET FLOW
An experimental study of two-dimensional supersonic jet impingement on a flat plate
[AD-A076536] N80-17996
SUPERSONIC NOZZLES
Numerical solution of a supersonic nozzle afterbody flow with jet exhaust
[AD-A076116] N80-17998
SUPPLYING
Report on the gas supply industry
[ERG-027] N80-18579
SURFACE ACOUSTIC WAVE DEVICES
Temperature compensated piezoelectric oxide materials --- investigation of piezoelectric crystal growth using Czochralski method for surface acoustic wave devices with electromechanical coupling
[AD-A077650] N80-18969
SURFACE CRACKS
Environmental stress cracking of polymers
[NASA-CR-162825] N80-18182
SURFACE DEFECTS
The nature of strength controlling machining flaws in ceramics
[AD-A075481] N80-18189
Action of plastic deformations in the mechanical damage suffered by the surface of structures
[ICAF-1114] N80-18435
Repeated plastic deformation as a cause of mechanical surface damage in fatigue, wear, fretting-fatigue, and rolling fatigue: A review
[ICAF-1116] N80-18436
Utilization of 'stags' to determine knockdown factors from measured initial imperfections --- in stringer stiffened shells
[VTH-LR-275] N80-18460
SURFACE FINISHING
Deburring die-castings by wet vibratory plant
[NASA-TM-75755] N80-18244
Thin film deposit and treatment of surfaces by electric discharges
[PUBL-349] N80-18321
SURFACE LAYERS
Laser melting and subsequent solidification of a surface layer --- heat flux N80-18375
SURFACE PROPERTIES
Effect of Surface Exposure Time (SET) on strength of adhesive bonds to aluminum
[AD-A077107] N80-18195
Texturing of concrete pavements
[PB80-106032] N80-18250
Applied Surface Analysis Workshop --- conferences
[AD-A078830] N80-18973
SURFACE REACTIONS
Applications of surface analysis techniques to studies of adhesion
[AD-A077520] N80-18198
Experimental results on plasma interactions with large surfaces at high voltages
[NASA-TM-81423] N80-18946
Applied Surface Analysis Workshop --- conferences
[AD-A078830] N80-18973
SURFACE ROUGHNESS
The influence of road roughness on the braking and steering performance of cars
[VTI-134] N80-18414
SURFACE TEMPERATURE
Analytical and experimental spur gear tooth temperature as affected by operating variables
[NASA-TM-81419] N80-18403
Satellite monitoring of sea surface pollution
[E80-10062] N80-18512

Applications of HCMM satellite data --- water quality, hydrology, and energy exchange of Lake Erie and Lake Ontario
[E80-10071] N80-18520
Plant cover, soil temperature, freeze, water stress, and evapotranspiration conditions --- Rio Grande Valley, Texas
[E80-10072] N80-18521
Dryland pasture and crop conditons as seen by HCMM --- Colby, Kansas and the Washita River watershed near Chickasha, Oklahoma
[E80-10074] N80-18523
HCMM energy budget data as a model input for assessing regions of high potential groundwater pollution --- Big Sioux River Basin, SOuth Dakota
[E80-10075] N80-18524

SURFACE TO AIR MISSILES
The digital air defense missile system simulation technical effort
[AD-A078814] N80-18081

SURFACE VEHICLES
Experimental use of electronic direction finding indicators in snow removal
[VTI-130] N80-18413

SURFACE WATER
HCMM energy budget data as a model input for assessing regions of high potential groundwater pollution --- Big Sioux River Basin, SOuth Dakota
[E80-10075] N80-18524

SURVEILLANCE RADAR
Radar surveillance/radar tracking variant to SPEARS
[AD-A076147] N80-18267

SURVIVAL EQUIPMENT
Suggestions for the contents of the Aviation Board survival kit
[FOA-A-59004-H3(H9)] N80-18721

SUSPENDING (MIXING)
Deformation and hydrodynamic interaction of two particles in a suspension N80-18336

SWEEP EFFECT
Effect of sweep and aspect ratio on the longitudinal aerodynamics of a spanloader wing in- and out-of-ground effect --- conducted in Langley V/STOL wind tunnel
[NASA-TM-80199] N80-17993

SWEPT WINGS
Interaction of a two-dimensional strip boundary layer with a three-dimensional transonic swept-wing code
[NASA-TM-78640] N80-17988

SWIRLING
An experimental investigation of two large annular diffusers with swirling and distorted inflow
[NASA-TP-1628] N80-17984

SWITCHES
High power RF coaxial switch
[NASA-CASE-NPO-14229-1] N80-18285

SWITCHING
Microvascular determinants of oxygen supply in resting and contracting striated muscle N80-18694

SWITCHING CIRCUITS
The effect of nonuniform channel doping on high frequency JFET and MESFET devices N80-18294
Lossless broadband microwave switches
[AD-A076379] N80-18305
The electrical switching properties of amorphous bismuth trioxide thin film devices
[AD-A077662] N80-18317
Methods for diagnosis of faults in switching networks
[GMD-MITT-43] N80-18322

SWITCHING THEORY
The design of deadlock- and livelock-free packet switching networks N80-18763

SYMBOLIC PROGRAMMING
Symbolic execution of formal machine descriptions N80-18740
Study of symbology for automated graphic displays
[AD-A076916] N80-18753

SYMMETRICAL BODIES
Environmental study of the interaction of two vortex rings having the same axis of symmetry
[MPIS-26/1978] N80-18352

SYMMETRY
K-uniformly convex Banach spaces N80-18801

SYMPATHETIC NERVOUS SYSTEM
Effect of consecutive cooling and immobilization on catecholamine metabolism in rat tissues
[NASA-TM-75962] N80-18684

SYNCHRONISM
A method for the transient stability enhancement of a power system using feedback control of a synchronous generator N80-18290

SYNOPTIC METEOROLOGY
Spectral analysis of synoptic scale disturbances over the Marshall Islands region N80-18596
Spherical harmonic analysis of a synoptic climatology generated with a global general circulation model
[NASA-CR-162804] N80-18607
Stability properties of medium-scale disturbances in a balance model
[INPR-1591-RPE/078-REV] N80-18634
A preliminary look at AVE-SESAME 1 conducted on 10-11 April 1979
[NASA-TM-78262] N80-18636
Summary of an eastpac refractive structure climatology
[AD-A075456] N80-18641
Verification of objective forecasts based on analogies
[KNMI-V-300] N80-18645
Results from establishing short term weather forecasts based on method of analogies
[KNMI-V-301] N80-18646
Results from a study of week long forecasts for 1975 - 1978
[KNMI-V-302] N80-18647
Analysis methods and front structure
[KNMI-WR-79-2] N80-18657
A subjective weather typology
[KNMI-V-319] N80-18661

SYNTHETIC APERTURE RADAR
System-design consideration for an optical correlator for the Seasat-A synthetic-aperture radar
[AD-A071358] N80-18265

SYNTHETIC FIBERS
Engineering feasibility of internal friction damping as a nondestructive evaluation technique for synthetic ropes
[AD-A078461] N80-18112

SYNTHETIC FUELS
Experimental alcohol fuel plants
[ATF-P-5000-2] N80-18203
Alcohol fuels information directory
[ATF-P-5000-3] N80-18204

SYSTEMS ANALYSIS
Report on the task force on aircraft separation assurance, appendices --- systems analysis of collision avoidance systems integration in the air traffic control airspace utilization system
[AD-A077713] N80-18017
Helicopter remote wind sensor system description
[AD-A076153] N80-18024
Orbiter subsystem hardware/software interaction analysis. Volume 8: Forward reaction control system
[NASA-TM-80959] N80-18088
Orbiter subsystem hardware/software interaction analysis. Volume 8: AFT reaction control system, part 2
[NASA-TM-80960] N80-18089
Chemical laser systems: An engineering approach. Volume 1: Chemical laser analysis program
[AD-A075476] N80-18386
A microprocessor controlled PROM programmer
[AD-A073154] N80-18733
Asymptotic measures of system performance under alternative operating rules, 1
[AD-A078826] N80-18872
Application of the second law to the analysis and design of energy systems N80-18978

SYSTEMS ENGINEERING
A new approach to multi-sensor navigation system design --- for air and digital navigation N80-18015
A hingeless rotor XV-15 design integration feasibility study. Volume 1: Engineering design studies
[NASA-CR-152310] N80-18030
An evaluation criteria model for the navigation network system design N80-18069
Picture Description Instructions (PDI) for the Telidon Videotex system
[CRC-TN-699-E] N80-18260
A fluorescent radiation converter
[NASA-CASE-GSC-12528-1] N80-18261
Feedback system design
[AD-A078486] N80-18777
Asymptotic measures of system performance under alternative operating rules, 2 --- failure and repair stochastic processes
[AD-A078827] N80-18870
A systematic approach to logical database design N80-18983

SYSTEMS MANAGEMENT
A hybrid method for the solution of some multi-commodity spatial equilibrium problems
[AD-A078514] N80-18871

T

TABLES (DATA)
Double star observations made with the 28-inch refractor: 1963-1970
[ROY-OBS-BULL-184] N80-19000

TAIL SURFACES
Thrust augmented spin recovery device
[NASA-CASE-LAR-11970-2] N80-18048

TANDEM ROTOR HELICOPTERS
Low speed test of the aft inlet designed for a tandem fan V/STOL nacelle
[NASA-CR-159752] N80-18042

TAPE RECORDERS
Test methods for telemetry systems and subsystems. Volume 3: Test methods for recorder/reproducer systems and magnetic tape
[AD-A075736] N80-18091

TARGET ACQUISITION
Optimal control of systems with uncertainty --- target acquisition
[AD-A078433] N80-18785

TARGET RECOGNITION
Discrete analog processing for tracking and guidance control
[AD-A078809] N80-18026
Aircraft program for target background, and sky radiance measurements
[AD-A076959] N80-18624

TECHNOLOGICAL FORECASTING
Aeropropulsion in year 2000
[NASA-TM-81416] N80-18043

TECHNOLOGY ASSESSMENT
Continued study of NAVSTAR/GPS for general aviation
[NASA-CR-159145] N80-18020
Composite components on commerical aircraft
[NASA-TM-80231] N80-18109
Literature review on the mechanical behavior of fiber composite materials. Analysis of the state-of-the-art. Volume 2: Appendix
[LBF-TB-145-VOL-2-APP] N80-18440
Technology transfer: General and theoretical studies, volume 2: A bibliography with abstracts
[PB80-801509] N80-18995
An assessment of ground-based techniques for detecting other planetary systems. Volume 1: An overview --- workshop conclusions
[NASA-CP-2124] N80-18997

TECHNOLOGY TRANSFER
A preliminary study of the consequences of deep ocean mining technology transfer
[PB-300723/4] N80-18546
International transfer of technology
[GPO-37-153] N80-18989
Technology transfer: General and theoretical studies, volume 2: A bibliography with abstracts
[PB80-801509] N80-18995

TECHNOLOGY UTILIZATION
Applications of Coherent Anti-Stokes Raman Spectroscopy (CARS) N80-18127
The 30/20 GHz fixed communications systems service demand assessment. Volume 1: Executive summary
[NASA-CR-159619] N80-18262
The 30/20 GHz fixed communications systems service demand assessment. Volume 2: Main report
[NASA-CR-159620] N80-18263
The 30/20 GHz fixed communications systems service demand assessment. Volume 3: Annex
[NASA-CR-159621] N80-18264
Frequency synthesizers. Citations from the NTIS data base
[PB80-601905] N80-18323
Frequency synthesizers. Citations from the Engineering Index data base
[PB80-801913] N80-18324

Geothermal energy development in the eastern United States. Evaluation of potential geothermal resource areas
[PB-299925/8] N80-18547

TEFLON (TRADEMARK)
Space radiation effects on Teflon films
[AD-A076613] N80-18194

TELECOMMUNICATION
Frequency synthesizers. Citations from the NTIS data base
[PB80-801905] N80-18323
Radio propagation prediction services in Japan N80-18480
Radio disturbance warning issuance system N80-18481
Interprocess communication and synchronization for disturbed systems N80-18764

TELEMETRY
Preliminary telemetry operations experience with the real-time combiner, 1 November 1978 to 1 November 1979 N80-18072
Test methods for telemetry systems and subsystems. Volume 1: End-to-end test methods for telemetry systems
[AD-A075735] N80-18093
Test methods for telemetry systems and subsystems. Volume 2: Test methods for telemetry RF subsystems
[AD-A075775] N80-18094

TELEPHONY
Contributions of optimal receiver theory to digital equalization
[ETSI-04-176] N80-18284

TELESCOPES
MeV gamma radiation observed by a balloon-borne Compton telescope
[MPI-PAE/EXTRATERR-151] N80-18927

TELEVISION CAMERAS
Aircraft program for target background, and sky radiance measurements
[AD-A076959] N80-18624

TELEVISION SYSTEMS
Viterbi decoding modified for sources with memory N80-18073

TELEVISION TRANSMISSION
FM transmission of television from rockets and balloons
[AD-A075489] N80-18258

TEMPERATE REGIONS
Tropospheric path length fluctuation in temperate semiarid locales: Application to the gravitational wave detection experiment N80-18070
The relationship between total precipitable water and surface dew point
[INPE-1604-RPE/084-REV] N80-18633
Stability properties of medium-scale disturbances in a balance model
[INPR-1591-RPE/078-REV] N80-18634

TEMPERATURE CONTROL
Phase change/heat storage materials data compilation
[AD-A076414] N80-18096
Automatic thermal switch --- Space Shuttle equipment bay temperature control
[NASA-CASE-GSC-12415-1] N80-18338

TEMPERATURE DISTRIBUTION
Global frequency distribution of exospheric temperature
[AD-A077293] N80-18623

TEMPERATURE EFFECTS
Influence of ambient temperatures on the production of restraint ulcers in the rat
[NASA-TM-76028] N80-18686
Solar radiation test
[AD-A075734] N80-19018

TEMPERATURE MEASUREMENT
Resonant Doppler velocimeter --- velocity, temperature, and pressure measurement
[NASA-CR-162815] N80-18341
Infrared scanner concept verification test report
[NASA-TM-78264] N80-18367
Fast convergent iteration procedure for calculating the isobaric wet bulb temperature
[KNMI-V-327] N80-18666
Microscale measurements of temperature in the upper ocean from a towed body N80-18668

TEMPERATURE PROFILES
Characterization of metal damage through infrared technology N80-18148

TENSILE TESTS
Study and torsion testing of composite materials in the form of bars having rectangular cross-sections
[RR-094] N80-18200

TERMINAL CONFIGURED VEHICLE PROGRAM
Flight performance of the TCV B-737 airplane at Jorge Newberry Airport, Buenos Aires, Argentina using TRSB/MLS guidance
[NASA-TM-80223] N80-18021
Terminal configured vehicle program: Test facilities guide
[NASA-SP-435] N80-18028

TEST EQUIPMENT
MIL-STD-781C random reliability testing performed by using acoustic coupling N80-18219
Control of particulate emissions from turbine engine test cells by cooling water injection
[AD-A075947] N80-18587

TEST FACILITIES
Terminal configured vehicle program: Test facilities guide
[NASA-SP-435] N80-18028

TEST STANDS
A small-scale test for fiber release from carbon composites --- pyrolysis and impact
[NASA-TM-81179] N80-18105

TEXAS
Plant cover, soil temperature, freeze, water stress, and evapotranspiration conditions --- Rio Grande Valley, Texas
[E80-10072] N80-18521
Continuation of measurement of hydrologic soil-cover complex with airborne scatterometers --- Texas
[E80-10073] N80-18522

TEXTILES
Air pollution effects on materials. Citations from the American Petroleum Institute data base
[PB80-801871] N80-18588
Air pollution effects on materials. Citations from the NTIS data base
[PB80-801863] N80-18589

TEXTURES
Effect of soil texture on the microwave emission from soils
[NASA-TM-80632] N80-18530

THEOREM PROVING
Some optimal and near-optimal low rate algebraic convolution codes N80-18803
Stability and fixed points of point dissipative systems
[AD-A077410] N80-18876

THERMAL BATTERIES
Optimization of LiAl/NaAl-Cl sub 4/CuCl sub 2 thermal cells
[AD-A076945] N80-18577

THERMAL CONDUCTIVITY
Thermal conductivities and coefficients of thermal diffusion of a high-temperature plasma in a uniform magnetic field
[IPPJ-432] N80-18941

THERMAL DEGRADATION
Carbon impurity effect on the thermal degradation of a Si3N4-Y2O3 ceramic
[AD-A075138] N80-18190
Solar radiation test
[AD-A075734] N80-19018

THERMAL DIFFUSION
Thermal conductivities and coefficients of thermal diffusion of a high-temperature plasma in a uniform magnetic field
[IPPJ-432] N80-18941

THERMAL MAPPING
Satellite monitoring of sea surface pollution
[E80-10062] N80-18512
Measurement of soil moisture trends with airborne scatterometers --- Guymon, Oklahoma and Sublett, Kansas
[E80-10064] N80-18514
Dryland pasture and crop conditons as seen by HCMM --- Colby, Kansas and the Washita River watershed near Chickasha, Oklahoma
[E80-10074] N80-18523

THERMAL PROTECTION
Thermal barrier seal
[NASA-CASE-MSC-18390-1] N80-18398

THERMAL RESISTANCE
Fire test method for graphite fiber reinforced plastics
[NASA-TM-81436] N80-18107

THERMAL STABILITY
Hygrothermal response of polymer matrix composite materials
[AD-A076623] N80-18110
Comparison of the weight loss and adherence of nine different polyimide films thermally aged at 315 C and 350 C in air --- high temperature lubricants
[NASA-TM-81381] N80-18183
Long-term thermal stability of solithane, a candidate TWT encapsulant
[AD-A078832] N80-18187

THERMIONICS
Thermionic cathode life test studies
[NASA-TM-81441] N80-18302

THERMOCHEMICAL PROPERTIES
The characterization of the thermodynamics of specific and nonspecific interactions in liquid metal mixtures N80-18152

THERMODYNAMIC PROPERTIES
The characterization of the thermodynamics of specific and nonspecific interactions in liquid metal mixtures N80-18152
Calorimetric studies of polymer blend systems N80-18172
A study of the structure of liquid helium by X-ray scattering N80-18238
Spontaneous liquefaction in retrograde fluids under condensation shock waves
[MPIS-21/1978] N80-18351

THERMODYNAMICS
Macroscopic description of multi-phase systems: A thermodynamic theory of flow in porous media N80-18333
Infrared image enhancement obtained from meteorological satellites
[INPE-1596-RPE/081] N80-18635
A molecular thermodynamic model for aqueous solutions of nonpolar compounds and micelle formation N80-18902
Application of the second law to the analysis and design of energy systems N80-18978

THERMOREGULATION
The human body temperature regulation system --- closed control loop
[RAE-LIB-TRANS-2019] N80-18702

THERMOSPHERE
Absorption data analysis for EUVS experiment of the satellites AE-C, D and E
[AD-A078663] N80-18621

THIN FILMS
The electrical switching properties of amorphous bismuth trioxide thin film devices
[AD-A077662] N80-18317
Thin film deposit and treatment of surfaces by electric discharges
[PUBL-349] N80-18321

THREE DIMENSIONAL FLOW
Interaction of a two-dimensional strip boundary layer with a three-dimensional transonic swept-wing code
[NASA-TM-78640] N80-17988
Computer prediction of three-dimensional potential flow fields in which aircraft propellers operate: Computer program description and users manual
[NASA-CR-162816] N80-17994
Study of three-dimensional internal flow problems related to turbomachinery flows
[AD-A078376] N80-18344
Evolution of turbulence by three-dimensional numerical particle-vortex tracing
[AD-A076121] N80-18949

THRUST AUGMENTATION
Method and apparatus for rapid thrust increases in a turbofan engine
[NASA-CASE-LEW-12971-1] N80-18039
Thrust augmented spin recovery device
[NASA-CASE-LAR-11970-2] N80-18048

THUNDERSTORMS
A study of the variability of thunderstorm electrical events based on very-low-frequency electromagnetic data N80-18598
Thunderstorm-environment interactions determined with three-dimensional trajectories N80-18630

THYROID GLAND
Experimental investigation of the role of thyrocalcitonin in the prophylaxis of disturbances in the water-salt and mineral metabolism during a 30-day hypokinesia
[NASA-TM-75938] N80-18704

TIDES
Application of HCMM data to soil moisture snow and estuarine current studies
[E80-10068] N80-18517
TIMBER INVENTORY
An investigation of the utility of LANDSAT 2 MSS data to the fire-danger rating area, and forest fuel analysis within Crater Lake National Park, Oregon
N80-18500
TIME
Notes on the coordinate systems and time
[INPE-1634-RPE/093] N80-18878
TIME DEPENDENCE
Steady-state and time-dependent behavior of fusion-fission hybrid systems N80-18935
TIME LAG
The analysis of delays in simulator digital computing systems. Volume 2: Formulation of discrete state transition matrices, an alternative procedure for multirate digital computations --- flight control
[NASA-CR-152341] N80-18722
TIME OPTIMAL CONTROL
Optimal control problems with discrete time, linear dynamics, and convex state-control constraints
[VTT-ENT-26] N80-18791
TIME SERIES ANALYSIS
Application of mutual amount of information for time delay estimation --- its use in the diagnosis of epilepsy
[THT-210] N80-18714
Image models
[AD-A078468] N80-18820
TIN COMPOUNDS
Variable temperature 119M SN Moessbauer study of organotin - substituted styrene monomers and polymers
[AD-A075958] N80-18188
TIN TELLURIDES
Transport and recombination properties of lead tin telluride alloys
[AD-A078687] N80-18166
TITANIUM ALLOYS
Wear of homogeneous and composite materials under conditions of repeated normal and sliding impact
[AD-A078429] N80-18111
Some aspects of fatigue crack closure in titanium alloys
[AD-A076948] N80-18164
Corrosion characteristics of titanium alloys. Citations from the International Aerospace Abstracts data base
[PB80-801467] N80-18170
TOLLMEIN-SCHLICHTING WAVES
The generation of a Tollmien-Schlichting wave by a sound wave
[AD-A075816] N80-18886
TOOLING
Advanced manufacturing development of a composite empennage component for I-1011 aircraft
[NASA-CR-162862] N80-18104
TOPOGRAPHY
Signal signatures of topographic features using analog technology
[AD-A076110] N80-18536
TOPOLOGY
Topics in computational complexity --- graph theory N80-18748
On discrete metrics and betweenness relations --- graph theory N80-18799
Convergence theorems for abstract asymptotic martingales N80-18804
Initial value problems on non-euclidean topologies
N80-18977
TORSIONAL STRESS
Study and torsion testing of composite materials in the form of bars having rectangular cross-sections
[RR-094] N80-18200
A contribution to nonlinear rod theory --- for rotor blade stress analysis
[NASA-TM-75734] N80-18445
TOWED BODIES
Microscale measurements of temperature in the upper ocean from a towed body N80-18668
TOXIC HAZARDS
Toxic level hypergolic vapor detection sendor development
[NASA-CR-154633] N80-18366
TRACE ELEMENTS
Early diagenesis of trace metals in nearshore Long Island sound sediments N80-18670
TRACKING (POSITION)
Discrete analog processing for tracking and guidance control
[AD-A078809] N80-18026
TRACKING RADAR
ALTAIR observations of ionospheric irregularities and background densities
[AD-A078599] N80-18615
TRACKING STATIONS
Estimating the angular position of a moving deep space vehicle using two rotating tracking stations
N80-18064
TRACTION
Evaluation of a high performance fixed-ratio traction drive
[NASA-TM-81425] N80-18404
Constrained fatigue life optimization of a NASVYTIS multiroller traction drive
[NASA-TM-81447] N80-18407
TRAILING-EDGE FLAPS
Unsteady effects with control surfaces --- measured in a wind tunnel
[AAAF-NT-79-01] N80-18049
TRAJECTORY ANALYSIS
Full scale visualization of the wing tip vortices generated by a typical agricultural aircraft
[NASA-CR-162796] N80-17992
MODIFLY: A modular multi-degree-of-freedom trajectory program
[AD-A073901] N80-18079
Kinetic model for a purpose carrying target finding air defense missile (KINM)
[FOA-C-20315-E3] N80-18083
Ensemble trajectory analysis of summertime sulfate aerosol concentrations in the northeastern United States N80-18584
TRAJECTORY OPTIMIZATION
Concepts for generating optimum vertical flight profiles
[NASA-CR-159181] N80-18031
TRANSDUCERS
Solar cell angular position transducer
[NASA-CASE-LAR-11999-1] N80-18552
TRANSFORMATIONS (MATHEMATICS)
Remarks on bifurcation theory in differential equations
[AD-A078689] N80-18813
Stability from the bifurcation function
[AD-A078688] N80-18814
On a stochastic control problem with exit constraints
[AD-A078372] N80-18853
TRANSIENT RESPONSE
Transient effects on a stalled airfoil in a pulsating flow: Comparison with results from a similar airfoil undergoing horizontal shaking --- during wind tunnel tests
[AAAF-NT-79-13] N80-18003
A method for the transient stability enhancement of a power system using feedback control of a synchronous generator N80-18290
TRANSITION METALS
Hydrogen chemisorption and oxidation on transition metal carbides N80-18958
TRANSITION TEMPERATURE
On the synthesis of metastable A-15 Nb3Si by ion implantation and on its superconducting transition temperature
[AD-A077396] N80-18135
TRANSMISSION LINES
The EMP response of a system of uncoupled, interconnected cables
[AD-A077659] N80-18273
Bidirectional coupler for full duplex transmission on a single fiber
[AD-A075467] N80-18925
TRANSMISSION LOSS
Analysis of arbitrarily shaped wire antennas radiating over a lossy half-space N80-18254
Estimation of solar flame influence on radio circuit transmission loss N80-18468
TRANSMISSIONS (MACHINE ELEMENTS)
Evaluation of a high performance fixed-ratio traction drive
[NASA-TM-81425] N80-18404
An automatically-shifted two-speed transaxle system for an electric vehicle
[NASA-CR-159746] N80-18992
TRANSONIC FLOW
Interaction of a two-dimensional strip boundary layer with a three-dimensional transonic swept-wing code
[NASA-TM-78640] N80-17988
Solution of a few nonlinear problems in aerodynamics by the finite elements and functional least squares methods --- mathematical models of transonic flow using nonlinear equations
[NASA-TM-75732] N80-17990
Data report for a test program to study transonic flow fields about wing-body/pylon/store combinations. Volume 1: Tunnel empty flow survey data, wing body force/moment/surface pressure data, and pressure store force/moment/surface pressure data
[AD-A077182] N80-18001
Data report for a test program to study transonic flow fields about wing-body/pylon/store combinations. Volume 2: Flow field survey data for configurations 21 and 22
[AD-A077183] N80-18002
An investigation of F-16 nozzle-afterbody forces at transonic Mach numbers with emphasis on support system interference
[AD-A078693] N80-18046
Unsteady effects with control surfaces --- measured in a wind tunnel
[AAAF-NT-79-01] N80-18049
Comparison of several finite difference schemes for time marching methods as applied to one dimensional nozzle flow
[VKI-TN-132] N80-18353
TRANSONIC WIND TUNNELS
Implementation of unsteady oscillatory flow in a transonic wind tunnel
[AAAF-NT-79-15] N80-18004
Programs for the transonic wind tunnel data processing installation. Part 7: Extended focal
[AD-A073414] N80-18054
TRANSPARENCE
Aircraft transparency failure and logistical cost analysis: Supplemental study
[AD-A075500] N80-18033
Method of fabricating a photovoltaic module of a substantially transparent construction
[NASA-CASE-NPO-14303-1] N80-18550
TRANSPONDERS
SPS pilot signal design and power transponder analysis, volume 2, phase 3
[NASA-CR-160537] N80-18561
TRANSPORT AIRCRAFT
MINITWIST: A shortened version of TWIST
[LBF-TB-146] N80-18438
TRANSPORT PROPERTIES
Transport and recombination properties of lead tin telluride alloys
[AD-A078687] N80-18166
Intense relativistic electron beam investigations
[AD-A078515] N80-18920
Structural and transport properties of simple metals under high pressure N80-18959
TRANSPORT THEORY
Electromagnetic transmission through a filled slit of arbitrary cross section in a conducting plane of finite thickness N80-18256
Mathematical analysis of carbon dioxide transport by blood N80-18698
TRANSPORTATION
A hybrid method for the solution of some multi-commodity spatial equilibrium problems
[AD-A078514] N80-18871
TRANSPORTATION ENERGY
The aerial relay system: An energy-efficient solution to the airport congestion problem
[NASA-TM-80208] N80-18011
TRANSVERSE ACCELERATION
Rim inertial measuring system --- to measure angular rates and linear accelerations
[NASA-CASE-LAR-12052-1] N80-18019
TRAPPED PARTICLES
Process variable dependence and interrelationship between avalanche injected and radiation induced carrier trapping in thermal oxides
[AD-A078362] N80-18303
Long Duration Exposure Emulsion Package (LDEEP)
[AD-A077362] N80-18914

Ultraviolet spectroscopy of electron trapping centers in thermally grown SiO films N80-18955
TRAVELING CHARGE
Covariant electrodynamics in a medium N80-18895
TRAVELING WAVE AMPLIFIERS
Theory and design of cyclotron-wave traveling-wave amplifiers N80-18292
TRAVELING WAVE TUBES
Long-term thermal stability of solithane, a candidate TWT encapsulant
[AD-A078832] N80-18187
Thermionic cathode life test studies
[NASA-TM-81441] N80-18302
TREES (MATHEMATICS)
Quality of decision versus depth of search on game trees N80-18982
TREES (PLANTS)
Forest resource information system --- Baker County, Florida and Picayune, Mississippi sites; St. Regis Paper Company
[E80-10065] N80-18515
TRIATOMIC MOLECULES
COMMUTE: A computer code for noncommutative algebra --- for study of triatomic molecules in the atmosphere
[AD-A077360] N80-18905
TRIBOLOGY
The role of the micro environment on the tribological behavior of materials
[NASA-TM-81434] N80-18245
TRIMETHYL COMPOUNDS
Preparation and properties of ((trimethyl silyl)methyl)-gallium 3 compounds
[AD-A076123] N80-18137
TROPICAL METEOROLOGY
Land use and climatological parameters in humid tropics
[INPE-1630-RPE/092] N80-18496
TROPICAL REGIONS
Land use and climatological parameters in humid tropics
[INPE-1630-RPE/092] N80-18496
The relationship between total precipitable water and surface dew point
[INPE-1604-RPE/084-REV] N80-18633
TROPOSPHERE
Tropospheric path length fluctuation in temperate semiarid locales: Application to the gravitational wave detection experiment N80-18070
Tropospheric water vapor absorption in the infrared window regions N80-18594
TRUSSES
Cost minimization calculations for plane and three dimensional frame structures
[ILR-39] N80-18247
TUBE GRIDS
Bonded grid development
[AD-A078631] N80-18309
TUNABLE LASERS
Excited states of rubidium populated by stepwise excitation using a rubidium lamp and/or a tunable dye laser: Importance of redistribution collisions N80-18374
Application of tunable diode lasers as local oscillators in an Infrared Heterodyne Radiometer (IHR)
[NASA-CR-159121] N80-18382
Tunable diode laser heterodyne radiometer measurement of atmospheric absorption of solar radiation
[NASA-CR-162827] N80-18383
TURBINE BLADES
Internal coating of air cooled gas turbine blades
[NASA-CR-159701] N80-18041
Investigation of the boundary layer behavior on turbine airfoils
[AD-A075501] N80-18044
Aeroelastic equations of motion of a Darrieus vertical-axis wind-turbine blade
[NASA-TM-79295] N80-18446
Numerical calculation of steady inviscid full potential compressible flow about wind turbine blades
[NASA-TM-81438] N80-18497
TURBINE EXHAUST NOZZLES
An investigation of F-16 nozzle-afterbody forces at transonic Mach numbers with emphasis on support system interference
[AD-A078693] N80-18046
TURBOFAN ENGINES
Method and apparatus for rapid thrust increases in a turbofan engine
[NASA-CASE-LEW-12971-1] N80-18039
Proceedings of the 7th Ann. Tri-Service Meeting for Aircraft Engine Monitoring and Diagnostics --- conferences
[AD-A076126] N80-18045
Application of composite materials to turbofan engine fan exit guide vanes
[NASA-TM-81432] N80-18106
TURBOJET ENGINES
Control of particulate emissions from turbine engine test cells by cooling water injection
[AD-A075947] N80-18587
TURBOMACHINERY
A calculation procedure for viscous flow in turbomachines, volume 2
[NASA-CR-159636] N80-17995
TURBULENCE
A functional approach to the statistical mechanics of fluid particles in turbulence N80-18325
TURBULENT BOUNDARY LAYER
Calculation of subsonic normal force and centre of pressure position of bodies of revolution using slender body theory boundary layer method
[AD-A076128] N80-17999
The gust as a coherent structure in the turbulent boundary layer
[FFA-TN-AU-1499-PT-5] N80-18007
Turbulent-boundary-layer excitation and response thereto for a high-performance conical vehicle --- reentry N80-18229
TURBULENT FLOW
A calculation procedure for viscous flow in turbomachines, volume 2
[NASA-CR-159636] N80-17995
The physical structure of turbulent flames
[AD-A070008] N80-18136
Morphological and phenomenological study of the transformation of a ring vortex colliding with an object
[MPIS-14/1978] N80-18346
The influence of a high pressure gradient on unsteady velocity perturbations in the case of a turbulent supersonic flow
[AAAF-NT-79-10] N80-18348
A turbulent layers description of unsteady two dimensional flow
[AAAF-NT-79-18] N80-18349
TURBULENT MIXING
Turbulent mixing processes in a partially mixed estuary N80-18504
TWO DIMENSIONAL BOUNDARY LAYER
Interaction of a two-dimensional strip boundary layer with a three-dimensional transonic swept-wing code
[NASA-TM-78640] N80-17988
TWO DIMENSIONAL FLOW
An experimental study of two-dimensional supersonic jet impingement on a flat plate
[AD-A076536] N80-17996
A turbulent layers description of unsteady two dimensional flow
[AAAF-NT-79-18] N80-18349
The generation of a Tollmien-Schlichting wave by a sound wave
[AD-A075816] N80-18886

U

U.S.S.R.
Soviet short-term forecasts of active region evolution and flare activity N80-18469
Forecasting ionospheric and geomagnetic conditions at the IAG forecasting center N80-18471
UH-1 HELICOPTER
V/STOLAND avionics system flight-test data on a UH-1H helicopter
[NASA-TM-78591] N80-18047
ULCERS
Effect of the enzymatic inhibitor of Kunitz on the gastric lesions from reserpine, from phenylbutazone, from pyloric ligation and by restraint in the rat
[NASA-TM-76027] N80-18681
Influence of ambient temperatures on the production of restraint ulcers in the rat
[NASA-TM-76028] N80-18686
Restraint ulcers in the rat. 1: Influence on ulcer frequency of fasting and of environmental temperature associated with immobilization of varying durations
[NASA-TM-76031] N80-18705
ULTRASONIC FLAW DETECTION
Ultrasonic detection of surface flaws in gas turbine ceramics
[AD-A076023] N80-18191
ULTRASONIC RADIATION
Influence of absorption on ultrasonic non-specular reflectivity --- liquid-solid interfaces N80-18881
ULTRASONIC WAVE TRANSDUCERS
Liquid-immersible electrostatic ultrasonic transducer
[NASA-CASE-LAR-12465-1] N80-18363
ULTRASONICS
Relationship of acoustic emission and ultrasonic velocity to deformation mechanisms and dilatancy during the ductile deformation of marble N80-18590
ULTRAVIOLET RADIATION
Inelastic electron tunneling spectroscopy of UV irradiated molecules N80-18116
Radiation augmented combustion
[AD-A077563] N80-18138
ULTRAVIOLET SPECTROMETERS
Absorption data analysis for EUVS experiment of the satellites AE-C, D and E
[AD-A078663] N80-18621
ULTRAVIOLET SPECTROPHOTOMETERS
Calibration of an ultraviolet polychromator for rocketborne studies of aurora
[AP-19] N80-18626
ULTRAVIOLET SPECTROSCOPY
Ultraviolet spectroscopy of electron trapping centers in thermally grown SiO films N80-18955
UMBRAS
Sunspot vector magnetic fields and model umbral atmospheres N80-19016
UNDERWATER ACOUSTICS
Some basic aspects of oceanic internal waves and the sound-speed fluctuations they generate
[AD-A077537] N80-18677
Analysis of acoustic variations in the ocean produced by combined environmental effects --- mathematical model of variations in sound propagation due to ocean currents N80-18879
Surface scattering studies
[AD-A078434] N80-18889
UNDERWATER RESOURCES
A preliminary study of the consequences of deep ocean mining technology transfer
[PB-300723/4] N80-18546
UNITED STATES OF AMERICA
Geothermal energy development in the eastern United States. Evaluation of potential geothermal resource areas
[PB-299925/8] N80-18547
UNIVERSITY PROGRAM
NASA's university program: Active projects, fiscal year 1979
[NASA-TM-81777] N80-18979
Research and pedagogy in noise and vibration control N80-19020
UNMANNED SPACECRAFT
The deep space network
[NASA-CR-162795] N80-18058
Network functions and facilities N80-18059
Recent data on planets in the solar system N80-19014
UNSTEADY FLOW
Unsteady flow measurements in air intakes
[AAAF-NT-79-16] N80-18005
The influence of a high pressure gradient on unsteady velocity perturbations in the case of a turbulent supersonic flow
[AAAF-NT-79-10] N80-18348
A turbulent layers description of unsteady two dimensional flow
[AAAF-NT-79-18] N80-18349
UNSTEADY STATE
Unsteady effects with control surfaces --- measured in a wind tunnel
[AAAF-NT-79-01] N80-18049
UPPER ATMOSPHERE
MSFC solar activity predictions for satellite orbital lifetime estimation N80-18492
Numerical modeling of high latitude winds in the upper atmosphere N80-18629

URETHANES
The analysis and characterization of the urethane functional group via fusion reaction gas chromatography N80-18124
USER MANUALS (COMPUTER PROGRAMS)
General aviation airplane structural crashworthiness programmer's manual
[AD-A075737] N80-18008
Longitudinal joint systems in slip-formed rigid pavements. Volume 3: User's manual --- structural analysis
[AD-A078850] N80-18243
Graphics and composite material computer program enhancements for SPAR
[NASA-TM-80209] N80-18750
USER REQUIREMENTS
User definition and mission requirements for unmanned airborne platforms, revised
[NASA-CR-156861] N80-17981
LACIE evaluation and outlook panel transcript: The LACIE Symposium
[E80-10069] N80-18518

V

V/STOL AIRCRAFT
Low speed test of the aft inlet designed for a tandem fan V/STOL nacelle
[NASA-CR-159752] N80-18042
VACUUM EFFECTS
High power RF coaxial switch
[NASA-CASE-NPO-14229-1] N80-18285
VALENCE
Synthetic approaches to mixed-valence chemistry --- review of mixed valence chemical reactions and crystal growth
[AD-A078513] N80-18133
Applications of the Moessbauer Effect to the study of mixed-valence compounds
[AD-A077640] N80-18967
VANADIUM
Compton scattering studies of metals and hydrides with 412 KeV gamma radiation
[AD-A078801] N80-18163
VAPOR PHASES
Contribution of surface catalysis and gas phase reaction to catalytic combustor performance
[AD-A078465] N80-18134
Toxic level hypergolic vapor detection sendor development
[NASA-CR-154633] N80-18366
VAPORS
Collisional redistribution of light scattered by atomic vapors N80-18891
VARIABILITY
A study of the variability of thunderstorm electrical events based on very-low-frequency electromagnetic data N80-18598
VASCULAR SYSTEM
Effects of gravitational stress, hypokinesia and hypod, .mia on the structure of the vascular bed of the spleen
[NASA-TM-75934] N80-18711
VECTOR ANALYSIS
Guide to vectorization on the Naval Research Laboratory's Texas Instruments advanced scientific computer. Volume: Vectorization primer
[AD-A077365] N80-18760
Stability theory for mathematical programming problems with unbounded convex feasible regions: A point-to-set submap approach N80-18794
VECTOR SPACES
Remarks on bifurcation theory in differential equations
[AD-A078689] N80-18813
VECTORS (MATHEMATICS)
Optimal disturbed microprocessor architecture using multi-phase processing to perform a vector, matrix multiplication N80-18726
VEGETATION
Continuation of measurement of hydrologic soil-cover complex with airborne scatterometers --- Texas
[E80-10073] N80-18522
VEGETATION GROWTH
Plant cover, soil temperature, freeze, water stress, and evapotranspiration conditions --- Rio Grande Valley, Texas
[E80-10072] N80-18521
Estimation of effective hydrologic properties of soils from observations of vegetation density --- water balance of watersheds in Clinton, Maine and Santa Paula, California
[NASA-CR-162797] N80-18534
VEHICLE WHEELS
Improved tire/wheel concept --- pneumatic aircraft tire
[NASA-CASE-LAR-11695-2] N80-18402
VELOCITY MEASUREMENT
Air speed and attitude probe
[NASA-CASE-FRC-11009-1] N80-18036
Resonant Doppler velocimeter --- velocity, temperature, and pressure measurement
[NASA-CR-162815] N80-18341
VENUS (PLANET)
The development of computer programs to determine atmospheric winds from entry probe data and possible applications to the Pioneer Venus mission N80-19011
VERTICAL TAKEOFF AIRCRAFT
Viscous flowfields induced by two- and three-dimensional lift jets in ground effect
[AD-A078782] N80-18343
VESTS
Feasibility testing of a Body Inflatable Bladder (BIB) restraint device
[AD-A078681] N80-18013
VIBRATION
Baseline acoustic and vibration study of the Minuteman 2, Integrated Program Launch Control Center, WS-133B (IP)
[AD-A075509] N80-18082
Control of vibration and blast noise from surface coal mining, volume 4: Executive Report
[PB-299890/4] N80-18548
Control of vibration and blast noise from surface coal mining, volume 2
[PB-299888/8] N80-18994
VIBRATION DAMPING
Handbook of vibration and noise control --- of rubber
[AD-A071485] N80-18410
VIBRATION EFFECTS
Research and pedagogy in noise and vibration control N80-19020
VIBRATION MEASUREMENT
The Shock and Vibration Bulletin. Part 4: Vibration testing, instrumentation, loads and environments, tracked vehicles --- conference proceedings
[BULL-48-PT-4] N80-18213
Angular vibration measurement techniques --- airborne electro-optical package disturbances N80-18222
High frequency ground vibration measurement N80-18223
The reciprocity calibration of vibration standards over an extended frequency range N80-18224
Some dynamic response environmental measurements of various tactical weapons N80-18228
VIBRATION SIMULATORS
The Shock and Vibration Bulletin. Part 4: Vibration testing, instrumentation, loads and environments, tracked vehicles --- conference proceedings
[BULL-48-PT-4] N80-18213
Acoustics or shakers for simulation of captive flight vibration N80-18215
Broad-band mechanical vibration amplifier N80-18217
Stability and frequency response of hydro-mechanical shakers in vibration rigs N80-18218
MIL-STD-781C random reliability testing performed by using acoustic coupling N80-18219
VIBRATION TESTS
A mathematical method for determining a laboratory simulation of the captive-flight vibrational environment N80-18214
Conservatism in random vibration analysis and testing N80-18220
VIBRATIONAL SPECTRA
Three studies in the electronic and vibrational structure of polyatomic molecules. 1: The thermal lensing spectrometer and the local mode model of vibrational overtone spectra. 2: Calculations of second order hyperpolarizabilities. 3: The molecular structure of the benzyl radical and its ions and a program for normal mode analysis N80-18119
The Shock and Vibration Bulletin. Part 4: Vibration testing, instrumentation, loads and environments, tracked vehicles --- conference proceedings
[BULL-48-PT-4] N80-18213
VIBRATIONAL STRESS
Vibration injuries of the hand and arm: Their occurence and the evolution of standards and limits
[ISVR-TR-101] N80-18713
VIDEO COMMUNICATION
Picture Description Instructions (PDI) for the Telidon Videotex system
[CRC-TN-699-E] N80-18260
VIDEO DATA
Viterbi decoding modified for sources with memory N80-18073
A weighted line-finding algorithm
[AD-A076112] N80-18756
VIKING ORBITER SPACECRAFT
Viking orbiter completion mission N80-18060
VISCOSITY
A semi-empirical equation for the viscosity of air
[AD-A072053] N80-18342
Viscosity measuring instrument
[NASA-CASE-NPO-14501-1] N80-18357
VISCOUS FLOW
A calculation procedure for viscous flow in turbomachines, volume 2
[NASA-CR-159636] N80-17995
Effect of precursor heating on radiating and chemically reacting viscous flow around a Jovian entry body N80-18329
Viscous flowfields induced by two- and three-dimensional lift jets in ground effect
[AD-A078782] N80-18343
Convection in the Earth's mantle due to viscous shear at the core-mantle interface and due to large scale buoyancy N80-18592
VISIBILITY
Corrections for forwardly dispersed light with transmissometer (KNMI short range)
[KNMI-V-312] N80-18653
VISION
Models of human vision in digital image bandwidth compression N80-18697
VISUAL DISCRIMINATION
Size and luminance discrimination in the peripheral visual field
[MRL-R-760] N80-18703
VISUAL FIELDS
Size and luminance discrimination in the peripheral visual field
[MRL-R-760] N80-18703
VISUAL TASKS
The processing resource demands of failure detection in dynamic systems
[AD-A078329] N80-18420
VOCODERS
Evaluation and improvements to the quality and intelligibility of linear prediction voice coding N80-18255
VOICE DATA PROCESSING
Evaluation and improvements to the quality and intelligibility of linear prediction voice coding N80-18255
VOLCANOES
HCMM: Soil moisture in relation to geologic structure and lithology, northern California
[E80-10067] N80-18516
VOLTAGE AMPLIFIERS
Voltage feed through apparatus having reduced partial discharge
[NASA-CASE-GSC-12347-1] N80-18286
VOLTAGE CONVERTERS (DC TO DC)
Analytical core loss calculations for magnetic materials used in high frequency high power converter applications N80-18297
VOLTAGE GENERATORS
Driver for solar cell I-V characteristic plots
[NASA-CASE-NPO-14096-1] N80-18551
VOLTAGE REGULATORS
Software development, item 0005 of microprocessor-based power conditioner controller
[AD-A076118] N80-18757
VOLTERRA EQUATIONS
Stability considerations for Volterra integrodifferential equations N80-18792

VORTEX BREAKDOWN
Morphological and phenomenological study of the transformation of a ring vortex colliding with an object
[MPIS-14/1978] N80-18346
VORTEX RINGS
Morphological and phenomenological study of the transformation of a ring vortex colliding with an object
[MPIS-14/1978] N80-18346
On the evolution, persistance, instability, regeneration and disapperance of vortex rings
[MPIS-17/1978] N80-18350
Environmental study of the interaction of two vortex rings having the same axis of symmetry
[MPIS-26/1978] N80-18352
Evolution of turbulence by three-dimensional numerical particle-vortex tracing
[AD-A076121] N80-18949
VORTICES
An experimental and theoretical study of the confined vortex with high flow rate N80-18332
On the evolution, persistance, instability, regeneration and disapperance of vortex rings
[MPIS-17/1978] N80-18350
VULCANIZED ELASTOMERS
The effect of particle shape of model filler on the reinforcement of elastomeric vulcanizates
N80-18173

W

WALSH FUNCTION
Signal signatures of topographic features using analog technology
[AD-A076110] N80-18536
WARNING SYSTEMS
Radio disturbance warning issuance system
N80-18481
A review of the operation of the IUWDS Regional Warning Centre at the Ionospheric Prediction Service, Sydney N80-18482
A disturbance forecaster's view of the September 1977 events N80-18483
Lightning tracking system evaluation
[AD-A078722] N80-18617
WATER BALANCE
Estimation of effective hydrologic properties of soils from observations of vegetation density --- water balance of watersheds in Clinton, Maine and Santa Paula, California
[NASA-CR-162797] N80-18534
WATER COLOR
Satellite monitoring of sea surface pollution
[E80-10062] N80-18512
WATER EROSION
Final evaluation of rain erosion on sled test results at Mach 3.7 to 5.0 for slip-cast fused silica radome structures
[AD-A077348] N80-18113
WATER INJECTION
Analysis of freshwater lens formation in saline aquifers N80-18502
WATER POLLUTION
Satellite monitoring of sea surface pollution
[E80-10062] N80-18512
HCMM energy budget data as a model input for assessing regions of high potential groundwater pollution --- Big Sioux River Basin, SOuth Dakota
[E80-10075] N80-18524
On the future average mercury content of air, soil and river sediments in the European Economic Community and in the world's oceans
[EUR-6023] N80-18585
WATER QUALITY
Chemical and physical characterization of environmental pollutants N80-18121
Watershed constituent loading analysis utilizing empirical hydrochemical modeling techniques
N80-18503
Applications of HCMM satellite data --- water quality, hydrology, and energy exchange of Lake Erie and Lake Ontario
[E80-10071] N80-18520
WATER RESOURCES
Radar target for remotely sensing hydrological phenomena
[NASA-CASE-LAR-12344-1] N80-18498
Precipitation, open water evaporation and potential precipitation surplus in the Netherlands: Frequency distributions in the growing season
[KNMI-WR-79-4] N80-18662
WATER RUNOFF
Continuation of measurement of hydrologic soil-cover complex with airborne scatterometers --- Texas
[E80-10073] N80-18522
WATER TEMPERATURE
Coastal water temperatures in the southeastern portion of Brazil from oceanographic data and NOAA satellite observations, volume 1
[INPE-1569-RPE/070] N80-18671
WATER VAPOR
Tropospheric water vapor absorption in the infrared window regions N80-18594
A high speed digital autocorrelator and its application to mesospheric water vapor detection
[AD-A076018] N80-18609
H20-N2 transition rates and line shifts of water vapor
[AD-A078394] N80-18622
Numerical study of particle growth and water vapor concentration in noctilucent clouds
[AP-18] N80-18663
WATER WAVES
Oceanic wave measurement system
[NASA-CASE-MFS-23862-1] N80-18667
Wavelike baroclinic disturbances on shallow upper ocean density fronts N80-18669
A summary of wave data needs and availability
[AD-A076067] N80-18674
Some basic aspects of oceanic internal waves and the sound-speed fluctuations they generate
[AD-A077537] N80-18677
WATERPROOFING
Fluoroalkyl siloxanes as liquid-repellent fabric finishes. Part 1: A state-of-the-art review and synthesis of the monomers
[AD-A073149] N80-18184
WATERSHEDS
Watershed constituent loading analysis utilizing empirical hydrochemical modeling techniques
N80-18503
Correlation of spacecraft passive microwave system data with soil moisture indices (API) --- Southern Great Plains States: Oklahoma and Kansas
[E80-10063] N80-18513
Continuation of measurement of hydrologic soil-cover complex with airborne scatterometers --- Texas
[E80-10073] N80-18522
Dryland pasture and crop conditons as seen by HCMM --- Colby, Kansas and the Washita River watershed near Chickasha, Oklahoma
[E80-10074] N80-18523
Estimation of effective hydrologic properties of soils from observations of vegetation density --- water balance of watersheds in Clinton, Maine and Santa Paula, California
[NASA-CR-162797] N80-18534
WAVE ATTENUATION
Internal friction and modulus in rocks at depth
[NASA-CR-160476] N80-18606
WAVE EXCITATION
Excitation of electron plasma waves N80-18929
WAVE FRONT DEFORMATION
Wavelike baroclinic disturbances on shallow upper ocean density fronts N80-18669
WAVE FUNCTIONS
Numerical integration of a class of sinusoidal functions whose argument is the integral of a monotonic increasing function N80-18644
WAVE INTERACTION
Theory and design of cyclotron-wave traveling-wave amplifiers N80-18292
WAVE PROPAGATION
Multiple scattering of acoustic, electromagnetic and elastic waves
[AD-A077577] N80-18275
Lower hybrid heating associated with mode conversion on the Wisconsin octupole N80-18932
On the propagation of relativistic nonlinear electromagnetic waves in a cold plasma
[INPE-1624-RPE/089] N80-18937
Waves in hot magnetized plasmas
[INPE-1575-RRP/072] N80-18939
WAVE REFLECTION
Influence of absorption on ultrasonic non-specular reflectivity --- liquid-solid interfaces N80-18881
WAVEGUIDES
Lossless broadband microwave switches
[AD-A076379] N80-18305
Dielectric-loaded waveguide circulator for cryogenically cooled and cascaded maser waveguide structures
[NASA-CASE-NPO-14254-1] N80-18372
WAVELENGTHS
A fluorescent radiation converter
[NASA-CASE-GSC-12528-1] N80-18261
The kinetics of ion motion in CaF2:Er
[AD-A077555] N80-18911
WEAPON SYSTEMS
Some dynamic response environmental measurements of various tactical weapons
N80-18228
WEAR
Wear of homogeneous and composite materials under conditions of repeated normal and sliding impact
[AD-A078429] N80-18111
Wear particles of single-crystal silicon carbide in vacuum
[NASA-TP-1624] N80-18178
WEATHER
Electro-optical handbook. Volume 1: Weather support for precision guided munitions
[AD-A075168] N80-18637
WEATHER DATA RECORDERS
Meteorological measurements program during unified Navy field test program
[AD-A075459] N80-18640
WEATHER FOPECASTING
Ionospheric modeling at Air Force Global Weather Central N80-18491
Temperature and circulation anomalies in the eastern Canadian Arctic, summer 1946 - 1976
N80-18628
Weather forecasting for the construction and building industry during the winter 1976 - 1977
[KNMI-V-296] N80-18642
Verification of objective forecasts based on analogies
[KNMI-V-300] N80-18645
Are severe winters preceded by an abnormal circulation pattern in the fall?
[KNMI-V-315] N80-18655
Variation of meteorological parameters at selected sites in the Netherlands
[KNMI-V-314] N80-18656
Analysis methods and front structure
[KNMI-WR-79-2] N80-18657
A quasi-objective method for precipitation prediction
[KNMI-V-318] N80-18660
A subjective weather typology
[KNMI-V-319] N80-18661
WEBS (SUPPORTS)
Analysis and design of steel beam-to-column web connections N80-18241
WEIGHT (MASS)
Comparison of the weight loss and adherence of nine different polyimide films thermally aged at 315 C and 350 C in air --- high temperature lubricants
[NASA-TM-81381] N80-18183
WEIGHT ANALYSIS
Permanent magnet and superconducting generators in airborne, high power systems --- computer program to predict weight of the generators and component systems
[AD-A078424] N80-18311
WEIGHTING FUNCTIONS
Rank weighting in multiattribute utility decision making: Avoiding the pitfalls of equal weights
[AD-A078941] N80-18858
A weighted dispersion function for estimation in linear models
[AD-A077854] N80-18860
Convergence of weighted sums of random elements in type p spaces
[AD-A077436] N80-18864
WEIGHTLESSNESS
The cosmos today and tomorrow
[NASA-TM-75736] N80-19010

WELD TESTS
Environmental durability of the Weldbond, FPL and PABST joining systems
[AD-A076608] N80-18199

WELDED JOINTS
Estimation of the fatigue strength of welded joints based on non-destructive test results
[ICAF-1125] N80-18432

WELDED STRUCTURES
Environmental durability of the Weldbond, FPL and PABST joining systems
[AD-A076608] N80-18199

WHEAT
Development of LANDSAT-based technology for crop inventories
[E80-10054] N80-18506
Development of LANDSAT-based technology for crop inventories: Appendices
[E80-10055] N80-18507
Large Area Crop Inventory Experiment (LACIE). LACIE transition year plan for the direct estimation of wheat from LANDSAT imagery --- North Dakota
[E80-10059] N80-18510
Correlation of spacecraft passive microwave system data with soil moisture indices (API) --- Southern Great Plains States: Oklahoma and Kansas
[E80-10063] N80-18513
Dryland pasture and crop conditons as seen by HCMM --- Colby, Kansas and the Washita River watershed near Chickasha, Oklahoma
[E80-10074] N80-18523
Large Area Crop Inventory Experiment (LACIE). Composition and assembly of a spectral-met data base for spring and winter wheat, volume 2
[E80-10076] N80-18525
AgRISTARS: A joint program for agriculture and resources inventory surveys through aerospace remote sensing. Development and evaluation of clustering procedures --- large area crop inventories
[E80-10079] N80-18526
The easy remote sensing problem
[REPT-20] N80-18528

WIENER FILTERING
State estimation of linear systems driven simultaneously by Wiener and Poisson processes
N80-18296
Optimal discounted linear control of the Wiener process
[AD-A078487] N80-18778
Partially observed stochastic control systems
[AD-A078290] N80-18788

WIND (METEOROLOGY)
Numerical modeling of high latitude winds in the upper atmosphere N80-18629
Performance evaluation of the optical crosswind profiler
[AD-A075145] N80-18638
The development of computer programs to determine atmospheric winds from entry probe data and possible applications to the Pioneer Venus mission N80-19011

WIND DIRECTION
Wind Measurements at the TV tower at Markelo
[KNMI-V-313] N80-18654

WIND EFFECTS
Systematic wind error and the standard pluviometric
[KNMI-V-317] N80-18659
The response of an electrostatic microphone to an airflow
[RAE-LIB-TRANS-2011] N80-18883

WIND MEASUREMENT
Helicopter remote wind sensor system description
[AD-A076153] N80-18024
Wind and wave observations in the mesosphere using coherent-scatter radar
[UILU-ENG-79-2508] N80-18604
Wind Measurements at the TV tower at Markelo
[KNMI-V-313] N80-18654

WIND PROFILES
The gust as a coherent structure in the turbulent boundary layer
[FFA-TN-AU-1499-PT-5] N80-18007
The effects of spray entrainment on the mean wind profile and the overall load on marine structures N80-18335

WIND TUNNEL DRIVES
Implementation of unsteady oscillatory flow in a transonic wind tunnel
[AAAF-NT-79-15] N80-18004

WIND TUNNEL TESTS
Wind-tunnel/flight correlation study of aerodynamic characteristics of a large flexible supersonic cruise airplane (XB-70-1). 3: A comparison between characteristics predicted from wind-tunnel measurements and those measured in flight
[NASA-TP-1516] N80-17986
Comparison of aerodynamic coefficients obtained from theoretical calculations wind tunnel tests and flight tests data reduction for the alpha jet aircraft
[NASA-TM-75237] N80-17991
Data report for a test program to study transonic flow fields about wing-body/pylon/store combinations. Volume 2: Flow field survey data for configurations 21 and 22
[AD-A077183] N80-18002
Programs for the transonic wind tunnel data processing installation. Part 7: Extended focal
[AD-A073414] N80-18054

WIND TUNNELS
Methodology for making a self-absorption correction to the simple copper-line-ratio technique used for arc-tunnel enthalpy measurements
[AD-A078686] N80-18055
Static pressure orifice system testing method and apparatus
[NASA-CASE-LAR-12269-1] N80-18358

WIND VELOCITY
Wind Measurements at the TV tower at Markelo
[KNMI-V-313] N80-18654

WIND VELOCITY MEASUREMENT
Remote measurements of boundary layer velocity parameters by monostatic lidar
[AD-A078678] N80-18543
Performance evaluation of the optical crosswind profiler
[AD-A075145] N80-18638
Frequency distributions of the wind velocity and the wind energy of the lightships Terschellingerbank, Texel, Goeree and Noordhinder
[KNMI-V-309] N80-18650
Design and performance of an experimental Dual-Frequency Doppler Lidar for remote measurement of wind velocity N80-18923

WINDOWS (APERTURES)
Aircraft transparency failure and logistical cost analysis: Supplemental study
[AD-A075500] N80-18033

WINDPOWER UTILIZATION
Aeroelastic equations of motion of a Darrieus vertical-axis wind-turbine blade
[NASA-TM-79295] N80-18446
Control strategy for a variable-speed wind energy conversion system
[NASA-TM-75512] N80-18558
Appendix: MOD-1 wind turbine generator analysis and design report, volume 2
[NASA-CR-159496] N80-18565
A feasibility study of windpower for the New England area
[AD-A076614] N80-18568
Frequency distributions of the wind velocity and the wind energy of the lightships Terschellingerbank, Texel, Goeree and Noordhinder
[KNMI-V-309] N80-18650

WINDPOWERED GENERATORS
Flutter analysis of small windturbine, designed for manufacture and use in developing countries
[UTH-LR-272] N80-18415
Numerical calculation of steady inviscid full potential compressible flow about wind turbine blades
[NASA-TM-81438] N80-18497
Appendix: MOD-1 wind turbine generator analysis and design report, volume 2
[NASA-CR-159496] N80-18565
A feasibility study of windpower for the New England area
[AD-A076614] N80-18568

WINDSHIELDS
Aircraft transparency failure and logistical cost analysis: Supplemental study
[AD-A075500] N80-18033

WING FLOW METHOD TESTS
Dynamic stall on oscillating airfoils in oscillating free-streams N80-17983

WING LOADING
Effect of sweep and aspect ratio on the longitudinal aerodynamics of a spanloader wing in- and out-of-ground effect --- conducted in Langley V/STOL wind tunnel
[NASA-TM-80199] N80-17993

WING ROOTS
MINITWIST: A shortened version of TWIST
[LBF-TB-146] N80-18438

WING TIP VORTICES
Full scale visualization of the wing tip vortices generated by a typical agricultural aircraft
[NASA-CR-162796] N80-17992

WINGS
Design and test of a boron - aluminum high temperature wing
[AD-A075814] N80-18034

WIRE WINDING
Laser measuring system for incremental assemblies --- measuring wire-wrapped frame assemblies in spark chambers
[NASA-CASE-GSC-12321-1] N80-18380

WORKING FLUIDS
Analysis of the geothermal binary cycle using paraffin hydrocarbons as working fluids N80-18553

X

X RAY ANALYSIS
Charged dislocation in ice. 1: Existence and charge density measurement by X-ray topography
[AD-A078775] N80-18540

X RAY DIFFRACTION
Local residual stress near fatigue crack tip --- X-ray diffraction measurement technique
[ICAF-1129] N80-18433

X RAY IMAGERY
Nondestructive testing: X-ray photography and radiography, volume 2. Citations from the Engineering Index data base
[PB80-802200] N80-18421
Nondestructive testing: X-ray photography and radiography. Citations from the NTIS data base
[PB80-802192] N80-18422

X RAY SCATTERING
A study of the structure of liquid helium by X-ray scattering N80-18238

X RAY TELESCOPES
Balloon-borne observations of NGC 4511 using the MISO telescope N80-18998

XV-15 AIRCRAFT
Synthesis of rotor test data for real-time simulation
[NASA-CR-152311] N80-18029
A hingeless rotor XV-15 design integration feasibility study. Volume 1: Engineering design studies
[NASA-CR-152310] N80-18030

Y

YAG LASERS
Application of nonlinear crystals
[AD-A077570] N80-18974

YAW
Heat transfer to air from a yawed isothermal cylinder N80-18331

YIELD
Development of LANDSAT-based technology for crop inventories
[E80-10054] N80-18506
Development of LANDSAT-based technology for crop inventories: Appendices
[E80-10055] N80-18507

YIELD POINT
Plastic analysis of metal-matrix composite laminates N80-18102

YTTRIUM OXIDES
Carbon impurity effect on the thermal degradation of a Si3N4-Y2O3 ceramic
[AD-A075138] N80-18190
Microstructurally developed toughening mechanisms in ceramics: Transformation toughening in the Al2O3/ZrO2 composite system
[AD-A076439] N80-18192

best copy available

Z

ZEEMAN EFFECT

Sunspot vector magnetic fields and model umbral atmospheres N80-19016

ZIRCONIUM OXIDES

Microstructurally developed toughening mechanisms in ceramics: Transformation toughening in the Al2O3/ZrO2 composite system [AD-A076439] N80-18192

PERSONAL AUTHOR INDEX

SCIENTIFIC AND TECHNICAL AEROSPACE REPORTS VOLUME 18 NUMBER 9

Typical Personal Author Index Listing

Listings in this Index are arranged alphabetically by personal author. The NASA accession number denotes the number by which the citation is identified.

CORPORATE SOURCE INDEX

Typical Corporate Source Index Listing

Listings in this index are arranged alphabetically by corporate source. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The NASA accession number denotes the number by which the citation is identified. The titles are arranged under each corporate source in ascending accession number order.

A

ACADEMIA SINICA, KUNMING (CHINA).
Spiral sunspots and solar activity forecasts N80-18474

ACADEMIA SINICA, NANKING (CHINA).
Long-term forecasting of solar activity N80-18476
Short-term solar activity forecasting N80-18477

ACADEMY OF SCIENCES, PEKING (CHINA).
Solar activity predictions at Peking Observatory N80-18475

AERONAUTICAL RESEARCH INST. OF SWEDEN, STOCKHOLM.
The gust as a coherent structure in the turbulent boundary layer
[FFA-TN-AU-1499-PT-5] N80-18007

AERONAUTICAL RESEARCH LABS., MELBOURNE (AUSTRALIA).
The Aerodynamics Division airborne data acquisition package test and calibration
[AD-A071365] N80-17997
Computer synthesis of flight simulation visuals
[ARL/SYS-NOTE-61] N80-18053
Programs for the transonic wind tunnel data processing installation. Part 7: Extended focal
[AD-A073414] N80-18054
Specification for the installation of electrical resistance strain gauges on strain pairs counter aircraft
[AD-A071363] N80-18369
Reliability analysis for optimum design
[ICAF-1132] N80-18418
A review of Australian investigations on aeronautical fatigue during the period April 1977 to March 1979
[AD-A071641] N80-18449
A microprocessor controlled PROM programmer
[AD-A073154] N80-18733

AERONAUTICAL SYSTEMS DIV., WRIGHT-PATTERSON AFB, OHIO.
Proceedings of the 7th Ann. Tri-Service Meeting for Aircraft Engine Monitoring and Diagnostics
[AD-A076126] N80-18045

AEROSPACE CORP., EL SEGUNDO, CALIF.
Long-term thermal stability of solithane, a candidate TWT encapsulant
[AD-A078832] N80-18187
Space radiation effects on Teflon films
[AD-A076613] N80-18194
The generation of a Tollmien-Schlichting wave by a sound wave
[AD-A075816] N80-18886

AEROSPATIALE USINES DE TOULOUSE (FRANCE).
Rotors in forward flight and dynamic stall
[AAAF-NT-79-20] N80-18050

AIR FORCE ACADEMY, COLO.
Optimization of LiAl/NaAl-Cl sub 4/CuCl sub 2 thermal cells
[AD-A076945] N80-18577

AIR FORCE AERO PROPULSION LAB., WRIGHT-PATTERSON AFB, OHIO.
Permanent magnet and superconducting generators in airborne, high power systems
[AD-A078424] N80-18311
Proceedings of the 1st AFAPL generator and motors seminar
[AD-A078341] N80-18312

AIR FORCE ENGINEERING AND SERVICES CENTER, TYNDALL AFB, FLA.
Control of particulate emissions from turbine engine test cells by cooling water injection
[AD-A075947] N80-18587

AIR FORCE FLIGHT DYNAMICS LAB., WRIGHT-PATTERSON AFB, OHIO.
Angular vibration measurement techniques N80-18222

AIR FORCE GEOPHYSICS LAB., HANSCOM AFB, MASS.
PPS76: A computerized event mode solar proton forecasting technique N80-18495
Satellite atmospheric radiance measurements in the vacuum ultraviolet
[AD-A078628] N80-18620
Absorption data analysis for EUVS experiment of the satellites AE-C, D and E
[AD-A078663] N80-18621
COMMUTE: A computer code for noncommutative algebra
[AD-A077360] N80-18905
Long Duration Exposure Emulsion Package (LDEEP)
[AD-A077362] N80-18914

AIR FORCE GLOBAL WEATHER CENTRAL, OFFUTT AFB, NEBRASKA.
Geophysical forecasting at AFGWC N80-18490
Ionospheric modeling at Air Force Global Weather Central N80-18491

AIR FORCE MATERIALS LAB., WRIGHT-PATTERSON AFB, OHIO.
Applications of surface analysis techniques to studies of adhesion
[AD-A077520] N80-18198

AIR FORCE OCCUPATIONAL AND ENVIRONMENTAL HEALTH LAB., BROOKS AFB, TEX.
Baseline acoustic and vibration study of the Minuteman 2, Integrated Program Launch Control Center, WS-133B (IP)
[AD-A075509] N80-18082

AIR FORCE OFFICE OF SCIENTIFIC RESEARCH, WASHINGTON, D. C.
Some aspects of fatigue crack closure in titanium alloys
[AD-A076948] N80-18164

AIR FORCE ROCKET PROPULSION LAB., EDWARDS AFB, CALIF.
An investigation of particle size distribution using laser holography of burning solid propellant
[AD-A078904] N80-18210

AIR FORCE WEAPONS LAB., KIRTLAND AFB, N. MEX.
Data acquisition for the immediate future N80-18226

AIR WEATHER SERVICE, SCOTT AFB, ILL.
Electro-optical handbook. Volume 1: Weather support for precision guided munitions
[AD-A075168] N80-18637

AIRBORNE INSTRUMENTS LAB., MELVILLE, N. Y.
Application of tunable diode lasers as local oscillators in an Infrared Heterodyne Radiometer (IHR)
[NASA-CR-159121] N80-18382

AKRON UNIV., OHIO.
The effect of particle shape of model filler on the reinforcement of elastomeric vulcanizates N80-18173
Styrene-butadiene copolymerization in organolithium systems N80-18174

ALABAMA UNIV., UNIVERSITY.
Development of equivalents for electric power system transient stability analysis N80-18295
Stability theory for mathematical programming problems with unbounded convex feasible regions: A point-to-set submap approach N80-18794

AMERICAN ELECTRONIC LABS., INC., FARMINGDALE, N. J.
Electromagnetic radiation system (EMRS) for susceptibility testing
[AD-A076953] N80-18276

AMERICAN INST. OF BIOLOGICAL SCIENCES, ARLINGTON, VA.
Symposium on Dissertations on Chemical Oceanography
[AD-A078526] N80-18676

AMERICAN UNIV., WASHINGTON, D. C.
The preparation of some novel electrolytes: Synthesis of partially fluorinated alkanesulfonic acids as potential fuel cell electrolytes
[AD-A078473] N80-18570

ANALYTIC SCIENCES CORP., READING, MASS.
Differential Omega in the Alaska/Yukon region: An analytic assessment
[AD-A078517] N80-18018

ANALYTICAL MECHANICS ASSOCIATES, INC., MOUNTAIN VIEW, CALIF.
Concepts for generating optimum vertical flight profiles
[NASA-CR-159181] N80-18031

APPLIED PHYSICS LAB., JOHNS HOPKINS UNIV., LAUREL, MD.
Geothermal energy development in the eastern United States: Evaluation of potential geothermal resource areas
[PB-299925/8] N80-18547
A correlation between auroral kilometric radiation and field-aligned currents
[NASA-CR-162842] N80-18611

ARCON CORP., WALTHAM, MASS.
Mathematical analysis and programming as applied to electromagnetic propagation and antenna design
[AD-A076150] N80-18266

ARINC RESEARCH CORP., ANNAPOLIS, MD.
The application of reliability improvement warranty to dynamic systems
[AD-A075520] N80-18419

ARIZONA STATE UNIV., TEMPE.
Modeling requirements for network simulation of human-machine systems N80-18717

ARIZONA UNIV., TUCSON.
Muscular force velocity alterations consequent to slow and fast velocity power training N80-18696
Models of human vision in digital image bandwidth compression N80-18697
Multiphase averaging of periodic soliton equations N80-18802
Design and performance of an experimental Dual-Frequency Doppler Lidar for remote measurement of wind velocity N80-18923

SOURCE

ARMY ARMAMENT RESEARCH AND DEVELOPMENT COMMAND, DOVER, N. J.
Effect of Surface Exposure Time (SET) on strength of adhesive bonds to aluminum
[AD-A077107] N80-18195
ARMY ARMAMENT RESEARCH AND DEVELOPMENT COMMAND, WATERVLIET, N. Y.
Dynamic stability of columns subjected to nonconservative forces

CALIFORNIA INST. OF TECH., PASADENA.
Anti-plane shear fields with discontinuous deformation gradients near the tip of a crack in finite elastostatics
[AD-A076027] N80-18448
CALIFORNIA SCHOOL OF PROFESSIONAL PSYCHOLOGY, LOS ANGELES.
The power process: A synthesis theory of power N80-18715
CALIFORNIA UNIV., BERKELEY.
Elastic/plastic indentation damage in ceramics. Part 1: The median/radial crack system. Part 2: A study of kink band formation in composites
[AD-A078839] N80-18197
On-chip peripheral circuits for CCD signal processors
[AD-A076603] N80-18320
Methodology for estimation of total body composition in laboratory mammals
[NASA-CR-162806] N80-18679
No period two implies convergence, or why use tangents when secants will do
[AD-A078479] N80-18815
Asymptotic measures of system performance under alternative operating rules, 2
[AD-A078827] N80-18870
Asymptotic measures of system performance under alternative operating rules, 1
[AD-A078826] N80-18872
CALIFORNIA UNIV., DAVIS.
The effect of nonuniform channel doping on high frequency JFET and MESFET devices N80-18294
Heat transfer to air from a yawed isothermal cylinder N80-18331

Turbulent mixing processes in a partially mixed estuary N80-18504
Applications of stochastic models for image data compression
[AD-A078781] N80-18758
Studies in molecular dynamics of the friction coefficient and the Lorentz gas N80-18896

CALIFORNIA UNIV., IRVINE.
Collective ion acceleration controlled by a gas gradient N80-18890

CALIFORNIA UNIV., LOS ANGELES.
Countable state average cost regenerative stopping problems
[AD-A078509] N80-18781
Optimal investigatiOn as a regenerative stopping problem
[AD-A078510] N80-18782
Problem in stability analysis of finite difference schemes for hyperbolic systems
[AD-A078853] N80-18839

CALIFORNIA UNIV., SAN DIEGO.
Necessary conditions for the homogeneous formation of a volume avalanche discharge with specific applications to rare gas-halide excimer laser discharges N80-18373
Microscale measurements of temperature in the upper ocean from a towed body N80-18668

CALIFORNIA UNIV., SANTA BARBARA.
Evaluation and improvements to the quality and intelligibility of linear prediction voice coding N80-18255
High temperature EPR study of superionic conductors and strongly exchange coupled paramagnets N80-18960
Theoretical models of stellar formation N80-19006

CALSPAN ADVANCED TECHNOLOGY CENTER, BUFFALO, N.Y.
Applications of HCMM satellite data
[E80-10071] N80-18520

CARNEGIE-MELLON UNIV., PITTSBURGH, PA.
Symbolic execution of formal machine descriptions N80-18740
A column generation technique for the computation of stationary points
[AD-A076415] N80-18754
A hybrid method for the solution of some multi-commodity spatial equilibrium problems
[AD-A078514] N80-18871

CASE WESTERN RESERVE UNIV., CLEVELAND, OHIO.
Crystallinity, morphology, and rheology of PVC-plasticizer systems N80-18171

CATHOLIC UNIV. OF AMERICA, WASHINGTON, D. C.
Development of high strength optical fiber waveguides using residual surface compression
[AD-A078296] N80-18926

CENTRE NATIONAL D'ETUDES DES TELECOMMUNICATIONS, LANNION (FRANCE).
The French short term radiopropagation predictions in the decameter band N80-18464

CENTRE TECHNIQUE DES INDUSTRIES MECANIQUES, SENLIS (FRANCE).
The influence on spark machining efficiency of the technique for inducing dielectric circulation between the work material and the electrode
[CETIM-13-G-03-0] N80-18246

CESKOSLOVENSKA AKADEMIE VED, PRAGUE.
A method of predictions geomagnetic activity based on a coronal model of relations between solar and geomagnetic activities N80-18466

CHALMERS UNIV. OF TECHNOLOGY, GOTEBORG (SWEDEN).
Imperfect bifurcation and Banach space singularity theory
[CTH-MATH-1979-12] N80-18843

CINCINNATI UNIV., OHIO.
A calculation procedure for viscous flow in turbomachines, volume 2
[NASA-CR-159636] N80-17995
Study of three-dimensional internal flow problems related to turbomachinery flows
[AD-A078376] N80-18344

CITY COLL. OF THE CITY UNIV. OF NEW YORK.
Spherical harmonic analysis of a synoptic climatology generated with a global general circulation model
[NASA-CR-162804] N80-18607

CLEMSON UNIV., S.C.
A method for the transient stability enhancement of a power system using feedback control of a synchronous generator N80-18290
Collapse load analysis for plates and panels N80-18424

COLORADO STATE UNIV., FORT COLLINS.
Combustion stability with baffles, absorbers and velocity sensitive combustion
[NASA-CR-162803] N80-18128
Broad beam ion source operation with four common gases
[NASA-CR-162801] N80-18913

Pavement distress, evaluation, and performance
[PB80-101991] N80-18249
TRANSPORTATION SYSTEMS CENTER, CAMBRIDGE, MASS.
Implications of fuel-efficient vehicles on ride quality and passenger acceptance: Workshop proceedings
[NASA-CP-2096] N80-18990
TRW, INC., CLEVELAND, OHIO.
Ultrasonic detection of surface flaws in gas turbine ceramics
[AD-A076023] N80-18191
TRW, INC., REDONDO BEACH, CALIF.
Phase change/heat storage materials data compilation
[AD-A076414] N80-18096

U

UNITED TECHNOLOGIES RESEARCH CENTER, EAST HARTFORD, CONN.
Study of the effects of gaseous environments on the hot corrosion of superalloy materials
[NASA-CR-159747] N80-18155
UNIVERSITY OF SOUTHERN CALIFORNIA, LOS ANGELES.
Organosilicon chemistry
[AD-A078293] N80-18100
New methods for analysis of the performance of guidance and control systems
[AD-A078534] N80-18783
Rank weighting in multiattribute utility decision making: Avoiding the pitfalls of equal weights
[AD-A078941] N80-18858
On database management system architecture
[AD-A076417] N80-18987
UNIVERSITY OF SOUTHERN COLORADO, PUEBLO.
Environmental stress cracking of polymers
[NASA-CR-162825] N80-18182
UNIVERSITY OF SOUTHERN ILLINOIS AT CARBONDALE.
Stability considerations for Volterra integrodifferential equations N80-18792
UNIVERSITY OF SOUTHERN MISSISSIPPI, HATTIESBURG.
Deconvolution of gas chromatographic data
[NASA-CR-3229] N80-18360
UNIVERSITY OF SOUTHWESTERN LOUISIANA, LAFAYETTE.
A mathematical model for a virtual machine monitor and its supportive structure N80-18724
Methods of compacting microprograms N80-18744
A methodology for free format systems design N80-18747
The design and implementation of a relational and network database access language N80-18981
UNIVERSITY OF WESTERN MICHIGAN, KALAMAZOO.
A weighted dispersion function for estimation in linear models
[AD-A077654] N80-18860
UTAH STATE UNIV., LOGAN.
Watershed constituent loading analysis utilizing empirical hydrochemical modeling techniques N80-18503
Feature selection and classifier design with applications to remote sensing of mule deer N80-18505
Rocketborne ionospheric studies
[AD-A078799] N80-18616

V

VARIAN ASSOCIATES, PALO ALTO, CALIF.
Research on InGaAs FET's
[AD-A078816] N80-18976
VERMONT UNIV., BURLINGTON.
Synthetic approaches to mixed-valence chemistry
[AD-A078513] N80-18133
Applications of the Moessbauer Effect to the study of mixed-valence compounds
[AD-A077640] N80-18967
VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG.
The reduced order model problem in distributed parameter systems adaptive identification and control
[NASA-CR-162807] N80-18768
VIRGINIA UNIV., CHARLOTTESVILLE.
Discrete analog processing for tracking and guidance control
[AD-A078809] N80-18026
Inelastic electron tunneling spectroscopy of UV irradiated molecules N80-18116
Microvascular determinants of oxygen supply in resting and contracting striated muscle N80-18694
VON KARMAN INST. FOR FLUID DYNAMICS, RHODE-SAINT-GENESE (BELGIUM).
Comparison of several finite difference schemes for time marching methods as applied to one dimensional nozzle flow
[VKI-TN-132] N80-18353
VOUGHT CORP., DALLAS, TEX.
Low speed test of the aft inlet designed for a tandem fan V/STOL nacelle
[NASA-CR-159752] N80-18042

W

WARWICK UNIV. COVENTRY (ENGLAND).
Compton scattering studies of metals and hydrides with 412 KeV gamma radiation
[AD-A078801] N80-18163
WASHINGTON UNIV., SEATTLE.
A crucial demonstration of strong collision behavior of vibrational energy for gas-surface collisions
[AD-A078800] N80-18910
WATKINS-JOHNSON CO., SCOTTS VALLEY, CALIF.
High contrast CRT
[AD-A076235] N80-18304
WEAPONS SYSTEMS RESEARCH LAB., ADELAIDE (AUSTRALIA).
Calculation of subsonic normal force and centre of pressure position of bodies of revolution using slender body theory boundary layer method
[AD-A076128] N80-17999
WESTINGHOUSE ELECTRIC CORP., TRAFFORD, PA.
Method of producing silicon
[NASA-CASE-NPO-14382-1] N80-18231
WIDENER UNIV., CHESTER, PA.
Efficient fault analysis in linear analog circuits
[AD-A078604] N80-18314
WISCONSIN UNIV. - MADISON.
A mass point localized kinetic theory of fluids N80-18120
Remote measurements of boundary layer velocity parameters by monostatic lidar
[AD-A078678] N80-18543
Ensemble trajectory analysis of summertime sulfate aerosol concentrations in the northeastern United States N80-18584
Mass transfer studies of pulmonary function N80-18700
The design and implementation of a database management system using abstract data type
[AD-A077101] N80-18735
Coalescing Brownian motions on the line N80-18795
On the estimation of functions of several variables from aggregated data
[AD-A077105] N80-18823
FFT as nested multiplication, with a twist
[AD-A077099] N80-18824
A Newton method for the PIES energy model
[AD-A077102] N80-18825
Hogan's PIES example and Lemke's algorithm
[AD-A077103] N80-18826
Global and superlinear convergence of a class of scaled variable metric methods
[AD-A077098] N80-18827
Quasi-Newton methods for generalized equations
[AD-A077097] N80-18828
Calculating constraints on relational expressions
[AD-A077092] N80-18829
Newton's method for generalized equations
[AD-A077096] N80-18830
An energetic approach to homogenization problems with rapidly oscillating potentials
[AD-A077134] N80-18840
A globally and quadratically convergent algorithm for general nonlinear programming problems
[AD-A077104] N80-18841
Bayes sequential estimation procedures for life testing problems N80-18847
An intense source of negative polarized hydrogen ions N80-18897
Lower hybrid heating associated with mode conversion on the Wisconsin octupole N80-18932
Radial confinement of central cell plasma in tandem mirrors N80-18933
Application of the second law to the analysis and design of energy systems N80-18978
WISCONSIN UNIV., MADISON.
Bending strength of vertically glued laminated beams with one to five plies
[AD-A077173] N80-18456
WISS, JANNEY, ELSTNER AND ASSOCIATES, INC., NORTHBROOK, ILL.
Control of vibration and blast noise from surface coal mining, volume 4: Executive Report
[PB-299890/4] N80-18548
Control of vibration and blast noise from surface coal mining, volume 1
[PB-299887/0] N80-18993
Control of vibration and blast noise from surface coal mining, volume 2
[PB-299888/8] N80-18994
WORLD METEOROLOGICAL ORGANIZATION, GENEVA (SWITZERLAND).
World Weather Watch: Global Observing System - Satellite sub-system. Information on the application of meteorological satellite data in routine operations and research: Abstracts, annual summaries and bibliographies
[WMO-475-SUPPL-2] N80-18631
WYOMING UNIV., LARAMIE.
Hygrothermal response of polymer matrix composite materials
[AD-A076623] N80-18110

Y

YALE UNIV., NEW HAVEN, CONN.
Surface scattering studies
[AD-A078434] N80-18889
YANG (HAI C.) AND ASSOCIATES, NEW YORK, N.Y.
Nondestructive evaluation of airport pavements. Volume 1: Program references
[AD-A078835] N80-18051
YUCCA INTERNATIONAL, INC., SCOTTSDALE, ARIZ.
Software development, item 0005 of microprocessor-based power conditioner controller
[AD-A076118] N80-18757

CONTRACT NUMBER INDEX

Typical Contract Number Index Listing

Listings in this index are arranged alphanumerically by contract number. Under each contract number the NASA accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order. The NASA accession number denotes the number by which the citation is identified.

REPORT/ACCESSION NUMBER INDEX

Typical Report/Accession Number Index Listing

Listings in this index are arranged alphanumerically by report number. The NASA accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

PUBLIC COLLECTIONS OF NASA DOCUMENTS

DOMESTIC

NASA distributes its technical documents and bibliographic tools to eleven special libraries located in the organizations listed below. Each library is prepared to furnish the public such services as reference assistance, interlibrary loans, photocopy service, and assistance in obtaining copies of NASA documents for retention.

CALIFORNIA
University of California, Berkeley

COLORADO
University of Colorado, Boulder

DISTRICT OF COLUMBIA
Library of Congress

GEORGIA
Georgia Institute of Technology, Atlanta

ILLINOIS
The John Crerar Library, Chicago

MASSACHUSETTS
Massachusetts Institute of Technology, Cambridge

MISSOURI
Linda Hall Library, Kansas City

NEW YORK
Columbia University, New York

OKLAHOMA
University of Oklahoma, Bizzell Library

PENNSYLVANIA
Carnegie Library of Pittsburgh

WASHINGTON
University of Washington, Seattle

NASA publications (those indicated by an "*" following the accession number) are also received by the following public and free libraries:

CALIFORNIA
Los Angeles Public Library
San Diego Public Library

COLORADO
Denver Public Library

CONNECTICUT
Hartford Public Library

MARYLAND
Enoch Pratt Free Library, Baltimore

MASSACHUSETTS
Boston Public Library

MICHIGAN
Detroit Public Library

MINNESOTA
Minneapolis Public Library

TENNESSEE
Memphis Public Library

TEXAS
Dallas Public Library
Fort Worth Public Library

WASHINGTON
Seattle Public Library

WISCONSIN
Milwaukee Public Library

An extensive collection of NASA and NASA-sponsored documents and aerospace publications available to the public for reference purposes is maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

EUROPEAN

An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. By virtue of arrangements other than with NASA, the British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy of microfiche of NASA and NASA-sponsored documents, those identified by both the symbols "#" and "*", from: ESA - Information Retrieval Service, European Space Agency, 8-10 rue Mario-Nikis, 75738 Paris CEDEX 15, France.

NAS 1.9/4.

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION

WHAT YOU CAN DO FOR *STAR*

All users of this abstract service are urged to forward reports to be considered for announcement in *STAR*. This will aid NASA in its efforts to provide the fullest possible coverage of all scientific and technical publications that might support aeronautics and space research and development. If you have prepared relevant reports (other than those that you will transmit to NASA, DoD, or DOE through the usual contract- or grant-reporting channels), please send them for consideration to the NASA Scientific and Technical Information Facility, P. O. Box 8757, B. W. I. Airport, Maryland 21240.

Reprints of journal articles, book chapters, and conference papers are also welcome. These will be considered for announcement in *STAR's* companion journal, *International Aerospace Abstracts*.

You may specify a particular source to be included in a report announcement if you wish, otherwise the report will be placed on public sale at the National Technical Information Service. Copyrighted publications will be announced but not distributed or sold.

PURCHASE OF *STAR*

The semimonthly issues and the cumulative index issues are available postpaid on subscription and in single copy from the Superintendent of Documents, United States Government Printing Office, Washington, D.C., 20402, United States of America.

Semimonthly issues...

Annual subscription rates: $60.00 domestic; $75.00 foreign. Price per single copy: $2.50 domestic; $3.15 foreign.

Cumulative index issues, semiannual and annual

Annual subscription rates for both: $25.00 domestic; $31.25 foreign. Price per single copy: semiannual $9.50 domestic, $11.90 foreign; annual $16.00 domestic, $20.00 foreign.

Domestic subscription rates...

Apply to the United States, Canada, Mexico, and all Central and South American countries, except as noted below.

Foreign subscription rates...

Apply to Argentina, Brazil, French Guiana, Guyana, Surinam, Belize, and all other countries throughout the world.

Payment should be by check, money order, or document coupons, and must accompany order. Remittances from foreign countries should be made by international money order or draft on an American bank, payable to the Superintendent of Documents, or by UNESCO book coupons.

PUBLISHED BY:

UNITED STATES GOVERNMENT
NATIONAL AERONAUTICS AND SPACE ADMINISTRATION
SCIENTIFIC AND TECHNICAL INFORMATION BRANCH

Scientific and Technical Aerospace Reports, Volume 18, is prepared by the NASA Scientific and Technical Information Facility operated for the National Aeronautics and Space Administration by Informatics Information Systems Company.

The Administrator of the National Aeronautics and Space Administration has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Agency. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through June 30, 1981.

US ISSN 0036-8741

INTRODUCTION

Scientific and Technical Aerospace Reports (STAR) is a major component of a comprehensive National Aeronautics and Space Administration information system covering aeronautics, space, and supporting disciplines. *STAR* is issued on the 8th and 23rd of each month and announces current publications of the following types:

- NASA, NASA contractor, and NASA grantee reports
- Reports issued by other U.S. Government agencies, domestic and foreign institutions, universities, and private firms
- Translations in report form
- NASA-owned patents and patent applications
- Dissertations and theses

NEWARK PUBLIC LIBRARY
JUN 6 1980
U. S. GOVT. PUBS.
DEPOSITORY 376

Cumulative index volumes are published semiannually and annually.

Journal, book, and conference literature, cover-to-cover journal translations, and certain foreign dissertations are announced in a companion journal, *International Aerospace Abstracts (IAA)*, available on subscription from the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

ON-GOING RESEARCH PROJECTS

By arrangement between NASA and the Smithsonian Science Information Exchange (SSIE), a separate section of information on aerospace-related *On-Going Research Projects* is inserted into each issue of *STAR*. The insert presents titles of active NASA grants and university contracts, summary portions of recently updated *NASA Research and Technology Objectives and Plans (RTOPs)*, and notices of non-NASA research projects that were funded in the most recent or current fiscal year. The latter are selected by SSIE. The project announcements in the insert are arranged by *STAR* divisions but are otherwise entirely separate from *STAR*. They are not indexed nor machine-searchable by NASA. Current and retrospective searches are available from SSIE, 1730 M Street, N.W., Washington, D.C. 20036.

SUBJECT SCOPE

Subject scope of *STAR*, *IAA*, and *On-Going Research Projects* includes all aspects of aeronautics and space research and development, supporting basic and applied research, and applications. Aerospace aspects of earth resources, energy development, conservation, oceanography, environmental protection, urban transportation, and other topics of high national priority are also covered.

OTHER NASA PUBLICATIONS

Other NASA publications and information services are described in the publication, *The NASA Scientific and Technical Information System ... and How to Use It*, available without charge from the NASA Scientific and Technical Information Facility, P. O. Box 8757, B. W. I. Airport, Maryland 21240.

HOW TO USE STAR SUBJECT CATEGORIES

STAR is categorized by 10 major subject divisions divided into 74 specific subject categories and one general category/division. The major subject divisions are listed in the Table of Contents, together with a note for each that defines its scope and provides any cross-references. For example:

AERONAUTICS

Includes aeronautics (general), aerodynamics, air transportation and safety, aircraft communications and navigation, aircraft design, testing and performance, aircraft instrumentation, aircraft propulsion and power, aircraft stability and control, and research and support facilities (air).

For related information see also *Astronautics*.

Each major division is further divided into as many as nine specific categories, which are identified by category numbers.

Abstracts in *STAR* are grouped by specific category, the categories appearing in sequential order. Category breaks in the abstract section are identified by the category number and title, and a scope note. Cross-references to other categories are provided as appropriate. For example:

02 AERODYNAMICS

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces, and internal flow in ducts and turbomachinery.

For related information see also *34 Fluid Mechanics and Heat Transfer*.

CROSS-REFERENCES

Individual *STAR* abstracts are not ordinarily cross-referenced, except for certain conference reports or book translations that have had separate abstracts written for their component papers or chapters. Citations and abstracts of the components follow immediately after those of the parent document. When the subject content of a component differs sufficiently from the general content of the parent, a cross-reference citation also is printed at the end of the category to which it normally would have been assigned if it were independent.

DOCUMENTS ON MICROFICHE

Documents on microfiche[1] are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

AVAILABILITIES

One or more sources from which a document announced in *STAR* is available to the public is given in each citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size, containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code following the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard $3.50 price, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this Introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free. (See discussion of patents and patent applications below.)

NASA PATENTS AND PATENT APPLICATIONS

Patents and patent applications owned by NASA are announced in *STAR* under appropriate subject categories and are referenced in the *STAR* indexes. In the Report/Accession Number Index, patents are indexed by the NASA Case Number (which appears in lieu of the report number in other indexes), the U.S. Patent Number, the U.S. Patent Application Serial Number, and the U.S. Patent Class. Patent applications for which patents have not yet been issued are indexed by the NASA Case Number and the U.S. Patent Application Serial Number.

NASA *patent application specifications* are sold in paper copy by the National Technical Information Service at price code A02 ($5.00 domestic; $10.00 foreign). Microfiche are sold at price code A01 ($3.50 domestic; $5.25 foreign). The US-Patent-Appl-SN- number should be used in ordering either paper copy or microfiche from NTIS. Printed copies of *patents* (which are not microfiched) are available for purchase at 50 cents per copy from:

Commissioner of Patents and Trademarks
U.S. Patent and Trademark Office
Washington, D.C. 20231

When ordering patents, the U.S. Patent Number should be used, and payment must be remitted in advance, preferably by money order or check payable to the Commissioner of Patents and Trademarks. Prepaid purchase coupons for ordering are also available from the Patent and Trademark Office. The patents and patent applications announced in *STAR* are owned by NASA and are available for royalty-free licensing. Requests for licensing terms and further information should be addressed to:

Assistant General Counsel for Patent Matters/Code GP-1
National Aeronautics and Space Administration
Washington, D.C. 20546

ELIGIBILITY AND REGISTRATION FOR NASA INFORMATION PRODUCTS AND SERVICES

A variety of services, in addition to the distribution of NASA scientific and technical reports and of *STAR* and its cumulative indexes, is available to organizations of the following types that have registered with NASA to receive specific services or products:

1. NASA offices, research centers, contractors, subcontractors, grantees, and consultants;

2. Other U.S. Government agencies and their contractors;
3. Libraries in the United States that have arrangements with NASA to maintain collections of NASA documents for public reference;
4. Other organizations in the United States having a need for NASA documents in work related to aeronautics and space research;
5. Organizations abroad that have established reciprocal document exchange arrangements with NASA.

Only the central service points or central points of document acquisition and control within qualified organizations are eligible to register for NASA products and services. Domestic organizations that may be eligible to receive various classes of NASA publications and services should address their requests for registration or for further information to:

NASA Scientific and Technical Information Facility
Attn.: Registration Activity
P.O. Box 8757
B.W.I. Airport, Maryland 21240

Organizations abroad should direct requests to the same address, but to the attention of: International Exchange Program.

AVAILABILITY OF STAR ABSTRACTS ON MICROFICHE

Microfiche of the abstract sections of this issue ahd other issues of *STAR* are available on annual subscription from NTIS, Attn: Subscriptions, 5285 Port Royal Road, Springfield, Virginia 22161. Annual subecription rates are $45.00 North America; $90.00 foreign. Abstract sections for previous years retroactive to 1964 are available at the current rates. Microfiche for individual *STAR* issue abstract sections are not available.

VOLUME 18 NUMBER 10/MAY 23, 1980

TABLE OF CONTENTS

AERONAUTICS

Includes aeronautics (general); aerodynamics; air transportation and safety; aircraft communications and navigation; aircraft design, testing and performance; aircraft instrumentation; aircraft propulsion and power; aircraft stability and control; and research and support facilities (air).

For related information see also *Astronautics*.

01 AERONAUTICS (GENERAL) 1229

02 AERODYNAMICS 1230

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

For related information see also *34 Fluid Mechanics and Heat Transfer*.

03 AIR TRANSPORTATION AND SAFETY 1233

Includes passenger and cargo air transport operations; and aircraft accidents.

For related information see also *16 Space Transportation* and *85 Urban Technology and Transportation*.

04 AIRCRAFT COMMUNICATIONS AND NAVIGATION 1234

Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.

For related information see also *17 Spacecraft Communications, Command and Tracking* and *32 Communications*.

05 AIRCRAFT DESIGN, TESTING AND PERFORMANCE 1235

Includes aircraft simulation technology.

For related information see also *18 Spacecraft Design, Testing and Performance* and *39 Structural Mechanics*.

06 AIRCRAFT INSTRUMENTATION 1241

Includes cockpit and cabin display devices; and flight instruments.

For related information see also *19 Spacecraft Instrumentation* and *35 Instrumentation and Photography*.

07 AIRCRAFT PROPULSION AND POWER 1242

Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and on-board auxiliary power plants for aircraft.

For related information see also *20 Spacecraft Propulsion and Power*, *28 Propellants and Fuels*, and *44 Energy Production and Conversion*.

08 AIRCRAFT STABILITY AND CONTROL 1245

Includes aircraft handling qualities; piloting; flight controls; and autopilots.

09 RESEARCH AND SUPPORT FACILITIES (AIR) 1246

Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tube facilities; and engine test blocks.

For related information see also *14 Ground Support Systems and Facilities (Space)*.

ASTRONAUTICS

Includes astronautics (general); astrodynamics; ground support systems and facilities (space); launch vehicles and space vehicles; space transportation; spacecraft communications, command and tracking; spacecraft design, testing and performance; spacecraft instrumentation; and spacecraft propulsion and power.

For related information see also *Aeronautics*.

12 ASTRONAUTICS (GENERAL) 1247

For extraterrestrial exploration see *91 Lunar and Planetary Exploration*.

13 ASTRODYNAMICS 1248

Includes powered and free-flight trajectories; and orbit and launching dynamics.

14 GROUND SUPPORT SYSTEMS AND FACILITIES (SPACE) 1248

Includes launch complexes, research and production facilities; ground support equipment, e.g., mobile transporters; and simulators.

For related information see also *09 Research and Support Facilities (Air)*.

15 LAUNCH VEHICLES AND SPACE VEHICLES 1248

Includes boosters; manned orbital laboratories; reusable vehicles; and space stations.

16 SPACE TRANSPORTATION 1252

Includes passenger and cargo space transportation, e.g., shuttle operations; and rescue techniques.

For related information see also *03 Air Transportation and Safety* and *85 Urban Technology and Transportation*.

17 SPACECRAFT COMMUNICATIONS, COMMAND AND TRACKING 1252

Includes telemetry; space communications networks; astronavigation; and radio blackout.

For related information see also *04 Aircraft Communications and Navigation* and *32 Communications*.

18 SPACECRAFT DESIGN, TESTING AND PERFORMANCE 1253

Includes spacecraft thermal and environmental control; and attitude control.

For life support systems see *54 Man/System Technology and Life Support*. For related information see also *05 Aircraft Design, Testing and Performance* and *39 Structural Mechanics*.

19 SPACECRAFT INSTRUMENTATION N.A.

For related information see also *06 Aircraft Instrumentation* and *35 Instrumentation and Photography*.

20 SPACECRAFT PROPULSION AND POWER 1253

Includes main propulsion systems and components, e.g., rocket engines; and spacecraft auxiliary power sources.

For related information see also *07 Aircraft Propulsion and Power, 28 Propellants and Fuels,* and *44 Energy Production and Conversion*.

CHEMISTRY AND MATERIALS

Includes chemistry and materials (general); composite materials; inorganic and physical chemistry; metallic materials; nonmetallic materials; and propellants and fuels.

23 CHEMISTRY AND MATERIALS (GENERAL) 1254

Includes biochemistry and organic chemistry.

24 COMPOSITE MATERIALS 1254

Includes laminates.

25 INORGANIC AND PHYSICAL CHEMISTRY 1257

Includes chemical analysis, e.g., chromatography; combustion theory; electrochemistry; and photochemistry.

For related information see also *77 Thermodynamics and Statistical Physics*.

26 METALLIC MATERIALS 1259

Includes physical, chemical, and mechanical properties of metals, e.g., corrosion; and metallurgy.

27 NONMETALLIC MATERIALS 1264

Includes physical, chemical, and mechanical properties of plastics, elastomers, lubricants, polymers, textiles, adhesives, and ceramic materials.

28 PROPELLANTS AND FUELS 1267

Includes rocket propellants, igniters, and oxidizers; storage and handling; and aircraft fuels.

For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power,* and *44 Energy Production and Conversion*.

ENGINEERING

Includes engineering (general); communications; electronics and electrical engineering; fluid mechanics and heat transfer; instrumentation and photography; lasers and masers; mechanical engineering; quality assurance and reliability; and structural mechanics.

For related information see also *Physics*.

31 ENGINEERING (GENERAL) 1271

Includes vacuum technology; control engineering; display engineering; and cryogenics.

32 COMMUNICATIONS 1272

Includes land and global communications; communications theory; and optical communications.

For related information see also *04 Aircraft Communications and Navigation* and *17 Spacecraft Communications, Command and Tracking*.

33 ELECTRONICS AND ELECTRICAL ENGINEERING 1286

Includes test equipment and maintainability; components, e.g., tunnel diodes and transistors; microminiaturization; and integrated circuitry.

For related information see also *60 Computer Operations and Hardware* and *76 Solid-State Physics*.

34 FLUID MECHANICS AND HEAT TRANSFER 1290

Includes boundary layers; hydrodynamics; fluidics; mass transfer; and ablation cooling.

For related information see also *02 Aerodynamics* and *77 Thermodynamics and Statistical Physics*.

35 INSTRUMENTATION AND PHOTOGRAPHY 1293

Includes remote sensors; measuring instruments and gages; detectors; cameras and photographic supplies; and holography.

For aerial photography see *43 Earth Resources*. For related information see also *06 Aircraft Instrumentation* and *19 Spacecraft Instrumentation*.

36 LASERS AND MASERS 1294

Includes parametric amplifiers.

37 MECHANICAL ENGINEERING 1296

Includes auxiliary systems (non-power); machine elements and processes; and mechanical equipment.

38 QUALITY ASSURANCE AND RELIABILITY 1299

Includes product sampling procedures and techniques; and quality control.

39 STRUCTURAL MECHANICS 1305

Includes structural element design and weight analysis; fatigue; and thermal stress.

For applications see *05 Aircraft Design, Testing and Performance* and *18 Spacecraft Design, Testing and Performance*.

GEOSCIENCES

Includes geosciences (general); earth resources; energy production and conversion; environment pollution; geophysics; meteorology and climatology; and oceanography.

For related information see also *Space Sciences*.

42 GEOSCIENCES (GENERAL) N.A.

43 EARTH RESOURCES 1308
Includes remote sensing of earth resources by aircraft and spacecraft; photogrammetry; and aerial photography.
For instrumentation see *35 Instrumentation and Photography*.

44 ENERGY PRODUCTION AND CONVERSION 1311
Includes specific energy conversion systems, e.g., fuel cells and batteries; global sources of energy; fossil fuels; geophysical conversion; hydroelectric power; and wind power.
For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power, 28 Propellants and Fuels,* and *85 Urban Technology and Transportation*.

45 ENVIRONMENT POLLUTION 1318
Includes air, noise, thermal and water pollution; environment monitoring; and contamination control.

46 GEOPHYSICS 1321
Includes aeronomy; upper and lower atmosphere studies; ionospheric and magnetospheric physics; and geomagnetism.
For space radiation see *93 Space Radiation*.

47 METEOROLOGY AND CLIMATOLOGY 1323
Includes weather forecasting and modification.

48 OCEANOGRAPHY 1329
Includes biological, dynamic and physical oceanography; and marine resources.

LIFE SCIENCES

Includes life sciences (general); aerospace medicine; behavioral sciences; man/system technology and life support; and planetary biology.

51 LIFE SCIENCES (GENERAL) 1329
Includes genetics.

52 AEROSPACE MEDICINE 1334
Includes physiological factors; biological effects of radiation; and weightlessness.

53 BEHAVIORAL SCIENCES 1336
Includes psychological factors; individual and group behavior; crew training and evaluation; and psychiatric research.

54 MAN/SYSTEM TECHNOLOGY AND LIFE SUPPORT 1337
Includes human engineering; biotechnology; and space suits and protective clothing.

55 PLANETARY BIOLOGY N.A.
Includes exobiology; and extraterrestrial life.

MATHEMATICAL AND COMPUTER SCIENCES

Includes mathematical and computer sciences (general); computer operations and hardware; computer programming and software; computer systems; cybernetics; numerical analysis; statistics and probability; systems analysis; and theoretical mathematics.

59 MATHEMATICAL AND COMPUTER SCIENCES (GENERAL) 1339

60 COMPUTER OPERATIONS AND HARDWARE 1344
Includes computer graphics and data processing.
For components see *33 Electronics and Electrical Engineering*.

61 COMPUTER PROGRAMMING AND SOFTWARE 1346
Includes computer programs, routines, and algorithms.

62 COMPUTER SYSTEMS 1350
Includes computer networks.

63 CYBERNETICS 1350
Includes feedback and control theory.
For related information see also *54 Man/System Technology and Life Support*.

64 NUMERICAL ANALYSIS 1351
Includes iteration, difference equations, and numerical approximation.

65 STATISTICS AND PROBABILITY 1353
Includes data sampling and smoothing; Monte Carlo method; and stochastic processes.

66 SYSTEMS ANALYSIS 1354
Includes mathematical modeling; network analysis; and operations research.

67 THEORETICAL MATHEMATICS 1356
Includes topology and number theory.

PHYSICS

Includes physics (general); acoustics; atomic and molecular physics; nuclear and high-energy physics; optics; plasma physics; solid-state physics; and thermodynamics and statistical physics.
For related information see also *Engineering*.

70 PHYSICS (GENERAL) N.A.
For geophysics see *46 Geophysics*. For astrophysics see *90 Astrophysics*. For solar physics see *92 Solar Physics*.

71 ACOUSTICS 1356
Includes sound generation, transmission, and attenuation.
For noise pollution see *45 Environment Pollution*.

72 ATOMIC AND MOLECULAR PHYSICS 1356
Includes atomic structure and molecular spectra.

73 NUCLEAR AND HIGH-ENERGY PHYSICS 1357
Includes elementary and nuclear particles; and reactor theory.
For space radiation see *93 Space Radiation*.

74 OPTICS 1358
Includes light phenomena.

75 PLASMA PHYSICS 1360
Includes magnetohydrodynamics and plasma fusion.
For ionospheric plasmas see *46 Geophysics*. For space plasmas see *90 Astrophysics*.

76 SOLID-STATE PHYSICS 1361
Includes superconductivity.
For related information see also *33 Electronics and Electrical Engineering* and *36 Lasers and Masers*.

77 THERMODYNAMICS AND STATISTICAL PHYSICS 1363
Includes quantum mechanics; and Bose and Fermi statistics.
For related information see also *25 Inorganic and Physical Chemistry* and *34 Fluid Mechanics and Heat Transfer*.

SOCIAL SCIENCES

Includes social sciences (general); administration and management; documentation and information science; economics and cost analysis; law and political science; and urban technology and transportation.

80 SOCIAL SCIENCES (GENERAL) 1363
Includes educational matters.

81 ADMINISTRATION AND MANAGEMENT 1363
Includes management planning and research.

82 DOCUMENTATION AND INFORMATION SCIENCE 1364
Includes information storage and retrieval technology; micrography; and library science.
For computer documentation see *61 Computer Programming and Software*.

83 ECONOMICS AND COST ANALYSIS N.A.
Includes cost effectiveness studies.

84 LAW AND POLITICAL SCIENCE 1365
Includes space law; international law; international cooperation; and patent policy.

85 URBAN TECHNOLOGY AND TRANSPORTATION 1365
Includes applications of space technology to urban problems; technology transfer; technology assessment; and surface and mass transportation.
For related information see *03 Air Transportation and Safety*, *16 Space Transportation*, and *44 Energy Production and Conversion*.

SPACE SCIENCES

Includes space sciences (general); astronomy; astrophysics; lunar and planetary exploration; solar physics; and space radiation.
For related information see also *Geosciences*.

88 SPACE SCIENCES (GENERAL) N.A.

89 ASTRONOMY 1366
Includes radio and gamma-ray astronomy; celestial mechanics; and astrometry.

90 ASTROPHYSICS 1366
Includes cosmology; and interstellar and interplanetary gases and dust.

91 LUNAR AND PLANETARY EXPLORATION 1367
Includes planetology; and manned and unmanned flights.
For spacecraft design see *18 Spacecraft Design, Testing and Performance*. For space stations see *15 Launch Vehicles and Space Vehicles*.

92 SOLAR PHYSICS 1367
Includes solar activity, solar flares, solar radiation and sunspots.

93 SPACE RADIATION 1367
Includes cosmic radiation; and inner and outer earth's radiation belts.
For biological effects of radiation see *52 Aerospace Medicine*. For theory see *73 Nuclear and High-Energy Physics*.

CSCL 01C

The aspects of flight testing an aeroelastically tailored forward swept research wing on a BQM-34F drone vehicle are examined. The geometry of a forward swept wing, which is incorporated into the BQM-34F to maintain satisfactory flight performance, stability, and control is defined. A preliminary design of the aeroelastically tailored forward swept wing is presented.

A.W.H.

ON-GOING RESEARCH PROJECTS

This is a listing of research projects - not publications

AERONAUTICS

Includes Aeronautics (general); Aerodynamics; Air Transportation and Safety; Aircraft Communications and Navigation; Aircraft Design, Testing, and Performance; Aircraft Instrumentation; Aircraft Propulsion and Power; Aircraft Stability and Control; and Research and Support Facilities (air). For Related Information See Also Astronautics.

1.0001, APPLICATION OF SUPERHARD TRANSPARENT COATING TO HELICOPTER WINDSHIELDS
G. Wintermute, Goodyear Aerospace Corp., *Litchfield Park, Arizona* 85340 (DA0E3852; DAAK51 78 C 0024)

The objective is the Army Field Service evaluation of 10 UH-1 helicopter windshields coated with a superhard transparent coating for windshield surface abrasion protection.

The approach is to process (fabricate and coat) the 10 UH-1 helicopter righthand windshields with Goodyear Aerospace Corporation No. 211 coating (developed by Goodyear Aerospace Corporation under Army contract DAAj02-76-C-0004) and install them on operational Army helicopters for operational service evaluation.

SUPPORTED BY U.S. Dept. of Defense, Aviation Research & Development Command, Applied Technology Lab.

1.0002, AAH AND BLACK HAWK CREW SEAT TESTING (DA0E3868)
D. Laananen, Simula Inc., *2223 S. 48th St., Tempe, Arizona* 85282 (DA0G0012; DAAK51-79-C-0016)

The objective of this program is to explore design techniques and criteria offering potential for improving helicopter seat crashworthiness.

The program consists of two tasks. The first task includes repairing and modifying an AAH-64 co-pilot/gunner seat, statically testing a candidate restraint system mounted on the modified seat, providing a test report, and instrumenting two restraint systems to be dynamically tested at the FAA Civil Aeromedical Institute (CAMI). The second task includes repairing a UH-60A pilot-co-pilot seat and providing it to the government for cadaver testing, providing test support that includes seat maintenance, conducting data analysis, and preparing a test report.

SUPPORTED BY U.S. Dept. of Defense, Aviation Research & Development Command, Applied Technology Lab.

1.0003, AEROELASTIC APPLICATIONS OF TRANSONIC UNSTEADY AERODYNAMICS
T.Y. Yang, Purdue University, Purdue Research Foundation, *Life Sciences Bldg., West Lafayette, Indiana* 47907 (DF141240; AFOSR-78-3523)

This work unit supports the technical base functions of the Structural Mechanics Division of the Air Force Flight Dynamics Laboratory. It addresses the problem areas of transonic unsteady aerodynamics, flutter, aeroelastic optimization and integration of aeroelastic disciplines. The goal is to create a numerical, analytical and experimental array of techniques to integrate the aeroelastic design, analysis and testing of aircraft structures to reduce the cost of design, acquisition and operation of new aircraft. This work unit will obtain substantial improvements in our ability to design, analyze and optimize aircraft structures for unsteady aerodynamic forces, vibrations, flutter, loads and aeroelastic control system interactions.

Initial developments will include the application of transonic unsteady aerodynamic computer programs to flutter problems. Finite element structural programs will also be modified to automate the input of data and the presentation of results.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0004, AUTOMATED LOW-COST WEATHER OBSERVATION SYSTEM (ALWOS)
R.R. Reynolds, U.S. Dept. of Commerce, National Oceanic & Atmospheric Admin., National Weather Service, Systems Development Office, Equipment Development Laboratory, *8060 13th St., Silver Spring, Maryland* 20910 (RD590714)

OBJECTIVE: Develop a low-cost automatic weather station and sensor for the FAA. This station will essentially be a limited alternative to AV-AWOS. Only one ceiling and one visibility sensor will be used instead of three. Algorithms will be limited initially to 3000' ceiling and 1/4 through 7 miles visibility.

APPROACH: Contract for a laser ceilometer and forward scatter visibility device. Develop algorithms for these and incorporate into microprocessor. Contract for a no-moving-parts anemometer. Modify existing design for an aspirated temp/dew point sensor. Contract for a new digital-to-voice converter. Use AV-AWO type thunderstorm, precipitation and freezing rain detector. Interface sensors to microprocessor-based automatic station similar to our Sensor Processor and Display equipment. Build demonstration unit, test it and prepare specification for FAA procurement.

PROGRESS: Development of the first phase of ALWOS called WAVE (Winds, Altimeter and Voice Equipment) has been completed. Testing of the WAVE system is underway with installation planned for late December 1978.

SUPPORTED BY U.S. Dept. of Transportation, Federal Aviation Admin., Systems Research & Development Service

1.0005, BOLTED FIELD REPAIR OF COMPOSITE STRUCTURAL COMPONENTS
J. Watson, McDonnell Douglas Corp., *P.O. Box 516, St. Louis, Missouri* 63166 (DN981067; N62269-78-C-0272)

To develop and demonstrate bolted field repair techniques for composite monolithic skins with damage in the area of the substructure. To provide simplified composite repair methods for structures applicable to emerging Navy aircraft which can be performed by organizational level personnel with minimal special training and logistic support. This work is in support of work unit ZA601, Aircraft Technology, Agency Accession No. DN 681080.

Various designs will be analyzed and the most promising will be selected for fabrication and testing. Damages of up to 4-inch diameters in skins of thicknesses of up to 1/2 inch will be investigated. Included among the specific damage areas to be studied are the torque box skin adjacent to spars and ribs, and skin with associated damage to the substructure cap and skin attachment elements. Both conventional metal substructure and composite sine wave substructure will be considered. In all cases, the designs will be limited to repairs which can be performed in the field. Repair concepts will be designed so that

they can sustain a gross strain level in the repaired area of more than 4000 micro in./in. while restoring the original stiffness. In addition, the repair will enable the structure to retain a 150 DII internal pressure capability. Additional constraints such as outside access only, relaxed tolerance for field capabilities, minimal external protrusion and fuel containment will also be considered. Static tension tests and internal pressure tests will be performed on fabricated specimens to verify the selected designs and procedures.

SUPPORTED BY U.S. Dept. of Defense, Naval Air Development Center, Aircraft & Crew Systems Tech Directorate

1.0006, SERVICEABILITY EVALUATION OF F-14 COMPOSITE MAIN LANDING GEAR STRUT DOOR AND OVERWING FAIRINGS

J. Mahan, Grumman Corp., *S. Oyster Bay Rd., Bethpage, New York* 11714 (DN881339; N62269-77-C-0436)

To provide actual long-term-service environmental data for composite structures and to identify any potential environment-related problems which may exist. To evaluate durability, reliability and maintenance requirements of composite structures in the Navy operational environment. This work is in support of work unit ZA601, 'Aircraft Technology', Agency Accession No. DN 681080.

Under previous contracts, composite overwing fairings and main landing gear strut doors for the F-14 aircraft have been fabricated and will be installed on Navy fleet aircraft. Under this contract, the condition and maintenance requirements of these components will be closely monitored by contractor field service representatives. Instructions will be prepared for squadron and field service personnel containing non-destructive inspection schedules and methods, damage criteria and repair and maintenance procedures specifically for these components. All significant occurrences pertinent to the composite components during the service usage will be recorded. The composite fairings and doors will be left in service for a period of up to five years. Periodically a set of components will be removed for NavAirDevCen inspection and laboratory evaluation.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Air Development Center

1.0007, GROUND PERFORMANCE CRITERIA FOR MILITARY AIRCRAFT TIRES

P.C. Ulrich, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF140880)

This effort supports the development of tire design, performance and laboratory test criteria/techniques and the development of new and improved tires for Air Force aircraft. Presently, tires are the highest single hardware grouping logistics and maintenance cost incurred for Air Force aircraft. Reduced aircraft all-weather operation capability and aircraft ground accidents are attributable to tire traction limitations. The objectives of this effort are to develop tire design and performance criteria, tire laboratory quality control and qualification test techniques, and to laboratory test and evaluate new tire designs. Accomplishment of these objectives will result in improving Air Force aircraft ground performance and reliability, and reduce Air Force logistics costs.

Unique tire test equipment in the AFFDL landing gear test facility will be used to establish tire force and moment properties under static, rolling, and braking conditions. Tire designs will be evaluated and new tire test techniques will be developed and verified by laboratory test and evaluation under the following work efforts: A. Cast tire evaluation, B. Siped tire evaluation, C. SAE tire tests D. Radial tire evaluation, and E. Bomb damage/repaired runway simulator.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0008, MULTIVARIATE DATA ANALYSIS - SIMULTANEOUS COMPARISON TEST

P.R. Krishnaiah, University of Pittsburgh, School of Arts & Sciences, Dept. of Mathematics & Statistics, *4200 5th Ave., Pittsburgh, Pennsylvania* 15260 (DF140650; AFOSR-77-3239)

Part of AFFDL's responsibility is the development of advanced flight control systems and crew stations. The use of electro-optical, multi-function controls and displays in advanced crew stations places many new demands upon the pilot's visual and information processing channels. In addition, in order to compare candidate flight control systems and crew station components, simulations and flight tests are conducted in which pilot performance is measured. However, there is no single measure of pilot performance, thus requiring the collection of many kinds of performance data and their analysis by means of multivariate statistical techniques. The objective of this work effort is two-fold: (1) to examine visual information processing techniques employing fast Fourier transforms, and (2) to evaluate available multivariate statistical techniques for simultaneous comparison of mean vectors and the development of computer programs to implement these techniques. Objective 1 will result in optimized symbol formats for electro-optical displays in advanced crew stations. Objective 2 will provide a means of determining which of the candidate crew stations/flight control systems is best for the pilot.

OBJECTIVE 1 - automatic pattern recognition techniques will be employed to evaluate symbol confusability both within and between symbol sets. OBJECTIVE 2 - seven currently available multivariate statistical techniques will be evaluated by the contractor as to their robustness to violations of the assumptions of homogeneity of the population covariance matrix and the normality of the multivariate distribution. The most robust technique will be implemented by means of computer programs which will be available for use by AFFDL personnel.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0009, HT 79-13 APPLICATION OF THE OPERATIONAL LOADS SURVEY (OLS) DATA

D.J. Merkley, U.S. Dept. of Defense, Army, Aviation Research & Development Command, Applied Technology Lab., *Fort Eustis, Newport News, Virginia* 23604 (DA0E3863)

Investigate and document selected aerodynamic and structural flight test data associated with the helicopter during operational maneuvers, to include the following topics: the effect of compressibility on rotor pressure distributions and maps of shock locations; the effect of vortex interactions; on rotor pressure distributions and maps of vortex interactions blade stagnation point locations as a function of azimuth-blade model participation factors based on various combinations of strains, accelerations and displacements; comprehensive analysis of simultaneously recorded data for selected flight conditions to allow for correlation of simultaneous events and correlation with analysis. The resulting documentation will aid the design, evaluation and development of improved rotor systems and helicopters to meet future Army operational needs.

The required procedures to investigate each of the above topics will be defined. Each of these topics will be investigated and documented separately with the aid of the data management and analysis system data-map (data from aeromechanics' test and analytics/management and analysis package, formerly known as OLS-DMS).

SUPPORTED BY U.S. Dept. of Defense, Aviation Research & Development Command, Applied Technology Lab.

1.0010, DEVELOPMENT OF AN ANALYTICAL TECHNIQUE TO PREDICT AIR CUSHIONED LANDING SYSTEM/COMPONENT PERFORMANCE

J. Kilner, Boeing Co., *7555 E. Marginal Way S., Seattle, Washington* 98124 (DF139640; F33615-77-C-3054)

This work unit supports the development and demonstration of air cushion landing systems, ACLS, for Air Force aircraft. Presently, a reliable analytical technique is not available for evaluating the performance of existing and new, proposed designs for ACLS components as a functioning part of a total flight vehicle system. The objective of this work unit is to develop and verify this needed ACLS prediction technique. Availability of the technique will significantly improve the effectiveness of, and increase the confidence level for, ACLS development and demonstration. Realization of the dramatic improve-

ments to flight vehicle mobility, self-sufficiency, and response promised by ACLS' ability to operate on any relatively level surface requires ability to evaluate ACLS performance as part of the total flight vehicle under consideration. The analytical technique developed will provide this needed capability.

An existing aircraft performance prediction computer program will be modified by the addition of system and subsystem subroutines for air cushion system, ACS takeoff and landing systems. Ability will be provided to simulate aircraft equipped with either elastic or inelastic ACS trunks. Then, the computer program shall be verified by simulating the performance of the ACS-equipped Buffalo, XC-8A, aircraft and comparing the results with actual XC-8A ACS takeoff, landing and ground operation data. Next, computer program revisions will be made as required. Finally, a technical report and computer program user's manual will be prepared and delivered along with the computer program which will be checked out and verified for use on the CDC6600 computer at Wright-Patterson AFB.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

CHEMISTRY AND MATERIALS

Includes Chemistry and Materials (general); Composite Materials; Inorganic and Physical Chemistry; Metallic Materials; Nonmetallic Materials; and Propellants and Fuels.

3.0001, IN SITU CHARACTERIZATION OF HYDROPROCESSING CATALYSTS

M. Boudart, Stanford University, School of Engineering, Dept. of Chemical Engineering, *Stanford, California* 94305 (DAR79-10071)

Few techniques are applicable to in situ characterization of catalysts, especially hydroprocessing catalysts, where both high pressure and high temperature are required. This cooperative research program between Chevron Research Company and Stanford University will utilize both X-ray absorption edge measurements and Extended X-ray Fine Structure Spectroscopy (EXAFS) to characterize Co/Mo/Al2O3 and Ni/Mo/Al2O3 catalysts at pressures (up to 2000 psig) and temperatures (up to 400 degrees C) typical of those during hydroprocessing catalysis. The reactor will employ gas and liquid hydrocarbon feeds and will simulate a trickle bed reactor. The research program will include X-ray characterization of single-component systems (e.g., Co/Al2O3) before proceeding to the actual catalysts and will study the reduction and sulfidation processes as well. X-ray absorption analysis of a number of reference materials, including Ni, Co and Mo sulfides and oxides as well as solid solutions of these materials in the alumina support will aid in interpretation of the catalyst characterization data.

SUPPORTED BY U.S. National Science Foundation, Directorate for Engineering & Applied Science, Div. of Applied Research

3.0002, LASER VULNERABILITY OF ADVANCED DESIGN SOLAR CELLS

R.L. Statler, U.S. Dept. of Defense, Navy, Naval Research Lab., *4555 Overlook Ave. S.W., Washington, District of Columbia* 20375 (DN980213)

The objective is to evaluate the vulnerability of advanced design solar cells to cw and pulsed high energy laser energy with the intent of defining specific damage modes and mechanisms. The results will provide guidelines for the design and manufacture of laser hardened solar cells for satellite applications.

Silicon and gallium arsenide solar cells now being developed by the AF for space missions will be subjected to cw and pulsed CO2 high energy laser radiation at 10.6 microns. Cell characteristics including forward and reverse V-I curves, spectral response, and V-I curves at amo will be measured before and after laser radiations. The changes observed in fundamental solar cell parameters will lead to an understanding of hardening procedures to be adapted in cell manufacture.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

3.0003, THEORY OF THE DIELECTRIC CONSTANT WITH APPLICATIONS TO THE MOLECULAR MOTION AND STRUCTURE OF LIQUIDS

R.L. Fulton, State University System of Florida, Florida State University, School of Arts & Sciences, Dept. of Chemistry, *205 Wildwood Dr., Tallahassee, Florida* 32306 (CHE77-23556 A01)

The frequency-dependent dielectric constant is simply related to time-dependent polarization fluctuations. These are in turn related to molecular position and orientation fluctuations, but, except for artificially simple models, the connection is not known explicitly. This project will study the second moments of the dielectric constant function, theoretically, with input from experiment, in order to assess the contribution of various kinds of molecular motions to the dielectric constant. In addition, the information so obtained will be used to assess the contribution of long-range polarization fluctuations to the surface properties of fluids.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Chemistry

3.0004, ATOMIC AND MOLECULAR PROCESSES

R.S. Berry, University of Chicago, Graduate School, Dept. of Chemistry, *5801 S. Ellis Ave., Chicago, Illinois* 60637 (CHE79-01166)

This research is in the area of quantum chemistry. Dr. Berry intends to continue a program of research involving the spectroscopic, thermodynamic and dynamic properties of nonrigid clusters, especially to relate nature and degree of nonrigidity to spectral distribution, but also extending to the interpretation of correlated motion in molecules, atoms, and nuclei, and to the interpretation of the nucleation and melting of very small clusters. The major effort in the spectroscopic aspect of this research, the analysis of spectra of nonrigid clusters, will be directed toward high-resolution spectra of real molecules. It is his intention both to predict vibration-rotation spectra from theoretical calculations based on pair interactions, to make phenomenological fits of experimental spectral lines to the patterns predicted by the correlation diagrams, and from these fits, to predict additional lines and interpret the nature and degree of molecular nonrigidity. In addition to PF5 he intends to examine the rare gas halides such as HeI2 and NeI2 that are best known from their laser-induced fluorescence spectra, and the alkali trimers and tetramers, whose potential surfaces are becoming known from theoretical calculations. This research represents a continuation of that currently supported by Foundation grant CHE7617821.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Chemistry

3.0005, SPECTROSCOPIC STUDIES AT LOW TEMPERATURES

G.E. Ewing, Indiana University, Bloomington Campus, Graduate School, Dept. of Chemistry, *2805 E. 10th, Bloomington, Indiana* 47401 (CHE79-13166)

Dr. Ewing is supported by a grant from the Structural Chemistry and Thermodynamics Program to (a) determine the structure and properties of van der Waals molecules, and (b) to study vibrational energy transfer in simple cryogenic liquids. Spectroscopic studies will be conducted on van der Waals molecules to determine bond lengths, geometry and intermolecular potentials for X2-Y type systems (e.g., N2-Kr, O2-Xe). Studies will also be carried out on more complex systems, such as CO2-Ar and (HC triple bond CH)2. These experimental studies will be complemented by theoretical studies on the role of van der Waals molecules in energy transfer processes. Such studies will contribute to a deeper understanding of intermolecular interactions which are responsible for the physical properties of solids, liquids and compressed gases. The cryogenic liquid studies will focus on CO2, N2, O2 and F2. These studies will contribute to understanding chemical reactions in the liquid state and form a basis for following vibrational energy as it moves from molecule to molecule. Such simple cryogenic systems should serve as models which can be applied to the understanding of more complex liquids.

This research is a continuation of that currently supported by Foundation Grant, CHE-7618721.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Chemistry

3.0006, METAL INSULATOR TRANSITION MATERIALS

W.J. Croft, U.S. Dept. of Defense, Army, Army Materiel Development & Readiness Command, Materials & Mechanics Research Center, *Watertown, Massachusetts* 02172 (DA0F4799)

The Army has a continuing need for very simple and rugged electronic devices of high reliability. The reduction of the number of components in a device to the absolute minimum for operation enhances the system reliability. Metal-insulator transition compounds represent the simplest solid-state devices for thermal switching of electric current - a single phase of a simple material that undergoes a large change in conductivity at the transition temperature. A typical material that undergoes this MOTT transition is vanadium dioxide which is being studied in detail.

This program will be concerned with the adaptation of the most suitable of the metal-insulator compounds to aircraft and missile applications. Consideration will be given to volume and current carrying capacity requirements for the several temperature ranges. Polycrystalline materials are being prepared by solid-state reaction in order to measure the bulk properties. Crystals are being grown by direct reduction of molten oxides and also by chemical vapor transport. Properties of these crystals are being compared with each other. Stability with temperature cycling, and effects of pressure and stoichiometry will be investigated. Efforts will be made to increase the size and perfection of the grown crystals.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Materials & Mechanics Research Center

3.0007, ELEVATED TEMPERATURE PROPERTIES OF METAL MATRIX COMPOSITES

A.P. Levitt, U.S. Dept. of Defense, Army, Army Materiel Development & Readiness Command, Materials & Mechanics Research Center, *Watertown, Massachusetts* 02172 (DA0H4704)

The technical objective is to determine the elevated temperature mechanical properties of metal matrix composites which are potential candidates for use in helicopter transmission cases such as FP/Mg, Gr/Mg, SiC/Mg, SiC/Al, and Gr/Al. Elevated temperature mechanical properties and thermal cycling data will be determined over the range of temperatures and times. Fatigue life will be evaluated as a function of fiber volume fraction.

The approach will include the fabrication and purchase of composites, preparation of test specimens, and testing them for elevated temperature, tensile strength and modules, and compressive strength and modules at temperatures up to 500 degrees F for 4 hours as a function of fiber volume fraction. Also, thermal cycling properties will be determined and fatigue properties measured. The results will contribute to the selection of the best composite for the transmission case and to the required data base for these materials.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Materials & Mechanics Research Center

3.0008, CHEMISTRY OF EPOXY CURING REACTIONS

N.S. Schneider, U.S. Dept. of Defense, Army, Army Materiel Development & Readiness Command, Materials & Mechanics Research Center, *Watertown, Massachusetts* 02172 (DA0G4763)

To characterize the curing behavior and determine the mechanism of cure of epoxy resin systems of Army interest. To improve the reproducibility and reliability of epoxy resins used in structural, fiber-reinforced composites. Major thrust is aircraft survivability.

Model epoxy resin systems will be formulated containing the principal components which have been identified in two commercial resins of Army interest, SP250 and RaC7250. The study will emphasize the use of purified components for reaction and curing mechanism studies. In certain cases, analog model reactants will be used to provide soluble products which can be separated for complete identification. Methods will include differential scanning calorimetry (DSC), torsional braid analysis (TBA), fourier transform infrared spectroscopy (FTS-IR), and high performance liquid chromatography (HPLC).

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Materials & Mechanics Research Center

3.0009, ENERGETIC EXPLOSIVE/PROPELLANT PREPOLYMERS AND BINDERS - NITROMERCURATION OF POLYDIENES AND POLYACETYLENES

J. Chien, University of Massachusetts, Amherst Campus, School of Natural Sciences & Mathematics, Dept. of Chemistry, *Amherst, Massachusetts* 01002 (DN975339; N00014-79-C-0265)

Nitro-substituted prepolymers and polymers are desirable for use in solid propellant and explosive formulations. The objective is to define the synthetic chemistry leading to nitro-substituted polyacetylenes and polydienes. Polynitroacetylene is the polymer analogue of hexanitrobenzene.

Energetic nitro-substituted polydienes and polyacetylenes will be synthesized by a new two-step nitromercuration technique. The degree of nitro substitution, glass transition temperatures, molecular weights and microstructures of the nitro-substituted polymers will be determined.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

3.0010, SCATTERING THEORY AND CALCULATIONS FOR CHEMICAL REACTIONS AND ELECTRON IMPACT PROCESSES

D.G. Truhlar, University of Minnesota, Minneapolis Campus, School of Chemistry, Dept. of Chemistry, *105 Morrill Hall, Minneapolis, Minnesota* 55455 (CHE77-27415)

Professor Truhlar and his co-workers will investigate the following research topics: (1) Quantum mechanical and semiclassical treatment of the chemical reaction of an electronically excited atom with a diatomic molecule. (2) Application of semiempirical model potentials to calculate differential cross-sections for electron impact spectroscopy. (3) Theoretical treatment of energy transfer processes involving vibrationally excited species. (4) Further development and testing of techniques for performing scattering calculations algebraically. (5) Use of approximations to simplify the theoretical treatment of rearrangement collisions, both electron-molecule collisions and chemical reactions. (6) Solution of the master equation (the equation for the time-dependence of the concentrations of species in various stages of excitation) for shock-tube dissociation of diatomic molecules using input data. This research represents a continuation of that currently supported by Foundation grant CHE75-06416.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Chemistry

3.0011, IMPROVED MEASUREMENT OF FUEL PROPERTIES

C.J. Nowack, U.S. Dept. of Defense, Navy, Naval Air Propulsion Center, Fuels Lubes & Power Dr Sys Gp, *1440 Pkwy. Ave., Trenton, New Jersey* 08628 (DN889799)

To investigate more refined methods for measuring fuel properties for both specification and research purposes.

Establish base line data from reference fuels (petroleum and non-petroleum derived hydrocarbons) and analyze them by gas chromatography (GC) and nuclear magnetic resonance (NMR). Correlate the GC and NMR data with present specification tests, and utilize these relationships to determine application of these advanced methods of fuel analysis for fuel specifications. If justified by results, establish new criteria for acceptance of JP-5 for Navy use based on compositional factors.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Material Command

3.0012, HYDROGEN ENTRY AND TRANSPORT MECHANISMS IN STRUCTURAL METALS 14057-MS

R.H. Heidersbach, University of Rhode Island, School of Engineering, Dept. of Ocean Engineering, *Administration Bldg., Kingston, Rhode Island* 02881 (DA0E9200; DAAG29 76 G0311)

To investigate hydrogen transport characteristics of structural metals, with emphasis on high hydrogen flux levels, as occur in hydrogen embrittlement cracking, and to investigate surface-entry mechanisms for hydrogen with and without the presence of molecular species which enhance hydrogen entry. Relevance - the research is complementary to a current study on the stress corrosion cracking characteristics of ESR and other high strength steels. Also, the Army has experienced failures of 7075-T6 aluminum, probably due to stress corrosion cracking. The structural alloys to be investigated are widely used by the Army in helicopters, ground mobility equipment, tanks, cannons, armored vehicles, and bridges. (1) Samples of as-cast and also electroslag-remelted (ESR) steels will be subjected to a selected set of controlled hydrogen fluxes, to examine the effect of remelt practice and subsequent impurity levels and microstructure on hydrogen transport. (2) Samples of 7xxx-series aluminum alloys will be studied as above in (1), to investigate the effect of aging on hydrogen susceptibility. (3) Utilization of infrared and Raman spectroscopy to study intermediate surface reactions which enhance hydrogen entry.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

3.0013, METAL LAMINATE DEVELOPMENT FOR STRUCTURES

R.M. Johnson, Advanced Technology Center Inc., *P.O. Box 6144, Dallas, Texas* 75222 (DN890148; N00019-78-C-0491)

Develop metal laminates used for critical structural parts, but not at the expense of strength, corrosion resistance or stress corrosion resistance.

Explore the metal/metal laminates utilizing recently developed alloys of titanium and steel.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Air Systems Command

3.0014, RAYLEIGH-BRILLOUIN LIGHT SCATTERING OF SEGMENTAL MOTION AND STRUCTURAL RELAXATION OF POLYMER LIQUIDS AND SOLIDS

C.H. Wang, Utah Higher Education System, University of Utah, School of Letters & Science, Dept. of Chemistry, *1400 E. 2nd S., Salt Lake City, Utah* 84112 (DMR79-12457)

This research deals with light scattering as a means of probing the nature of the motions of the long molecular chains known as polymers. The motions of segments of the polymer chains and the structural relaxation when the system is subjected to hypersonic frequencies (in the GHz region) are of particular concern. Principal emphasis will be on solutions of polymers, for example the polystyrene-cyclohexane system, and detailed studies will be conducted of the entire Rayleigh-Brillouin spectra using the combined techniques of Fabry-Perot interferometry and photon correlation spectroscopy. Aqueous solutions of poly(methacrylic acid) and of poly(vinyl alcohol) will also be examined as a function of temperature, concentration, and molecular weight. These experiments will be used to test and refine a recent theory for the behavior of liquids. An additional thrust will be the examination of Brillouin scattering spectra of opaque, stretched films of poly(ethylene terephthalate) and of polyethylene with various degrees of crystallinity.

This is a renewal of NSF Grant DMR77-03707 and is the first year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

For Related Information See Also Physics.

4.0001, CONTACT STRESS ANALYSIS OF CERAMIC-TO-METAL INTERFACES

H.L. Kington, Signal Co. Inc., Airesearch Manufacturing Incorporated, *402 S. 36th St., Phoenix, Arizona* 85034 (DN875617; N00014-78-C-0547)

The objective of this research is to conduct analysis, specimen testing, and data correlation in order to provide an improved understanding of the local contact conditions that prevail at an interface between ceramic and metal components for gas turbine engines. The program will be specifically directed to study contact stresses between inserted ceramic turbine blades and a metal rotor.

A finite-element stress analysis procedure and structural evaluation technique consistent with the statistical nature of ceramic materials will be generated. Specimen testing will be conducted to obtain validation of these techniques and provide insight as to possible modifications of stress simulation or fracture prediction criteria.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

4.0002, SOLID-STATE RADIO MAGNETIC/HORIZONTAL SITUATION INDICATOR (RMI/HSI)

B. Hoffman, Hughes Aircraft Co., Aerospace Groups, *Centinela Ave. & Teale St., Culver City, California* 90230 (DA0D3523; DAAB07-77-C-2194)

The objective of this task is the development of a digitally addressable, programmable, solid-state RMI/HSI employing a flat panel display. This unit is intended to replace existing electro-mechanical devices and be compatible with new, in-development, digital sensors, processors and the MIL-STD-1553A(B) digital data bus.

Integrate a flat panel (solid-state) display, drive circuitry, programmable symbol generator, signal processor, and control unit to accept and display all appropriate RMI/HSI signals for demonstration and evaluation of feasibility for eventual incorporation in Army aircraft.

SUPPORTED BY U.S. Dept. of Defense, Aviation Research & Development Command, Avionics Research & Development Activity

4.0003, ELECTRONIC PROCESSES IN INDIUM-PHOSPHATE AND RELATED COMPOUNDS

L.H. Devaux, Hughes Aircraft Co., *3011 S. Malibu Canyon Rd., Malibu, California* 90265 (DN890136; N00019-79-C-0082)

Determination of the characteristics of bulk InP that relate to its utility as an avalanche photo diode. A primary goal of this work shall be to measure the electron and hole ionization coefficients of commercially available bulk InP and to estimate carrier lifetimes.

InP will be characterized for physical perfection and determination of carrier concentration and mobilities. Schottky barrier and P-N functions/structures will be used as analytical tools to determine ionization coefficients.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Air Systems Command

4.0004, NAVY VEHICLE DESIGN AND CONSTRUCTION - FUNDAMENTAL AERODYNAMIC STUDIES OF WING-BODY INTERFERENCE AT HIGH ANGLES OF ATTACK

J.N. Nielsen, Nielsen Engineering & Research Inc., *510 Clyde Ave., Mountain View, California* 94043 (DN875550; N00014-78-C-0490)

A method has been developed for calculating with reasonable accuracy the forces and moments on the components of cruciform missiles at high angles of attack (up to 50 degrees) and Mach numbers up to 3.0. As a result of this work, a problem area has emerged which limits the accuracy and usefulness of this calculation method. As either angle of attack or Mach number are increased, the effect of the body on the wing is to substantially decrease the wing lift. It is not clear what causes the large wing-body interference and theoretical calculations to quantify the adverse effects are not available. The objective of this program is to determine the causes of the adverse wing-

body interference and to establish the theory and methodology which will allow calculation of the interference effects.

A fundamental study of wing-body interference effects at high angles of attack and supersonic speeds for missile configuration will be conducted. Recent advances in viscous and inviscid numerical computation techniques will be utilized, supplemented by detailed experimental work. The flow field in which a fin or wing might operate at high angles of attack and high Mach numbers will be calculated by extending a computer program for solving the Euler equations of motion for compressible flow. Later, vortex effects will be included. The predicted aerodynamic characteristics will be compared with experimental aerodynamic data.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

4.0005, STUDIES OF MAGNETOSPHERE-IONOSPHERE-ATMOSPHERE INTERACTIONS

R.A. Helliwell, Stanford University, School of Engineering, Dept. of Electrical Engineering, *Stanford, California* 94305 (ATM74-20084 A02)

This grant will support investigations into several aspects of magnetosphere-ionosphere-atmosphere coupling. The research includes both data analysis and theoretical work. VLF data from Stanford University's experimental programs at Siple, Antarctica, and Roberval, Quebec, will be used to study the thermal plasma dynamics and wave-particle interactions in the magnetosphere. The results will be compared with energetic particles and thermal plasma data from various ground-based instruments including incoherent scatter radars, HF sounders, photometers, etc. Atmospheric electric field data from the polar cap regions acquired through cooperative programs with other institutions will also be studied. Theoretical work will be aimed at modeling magnetosphere-ionosphere-atmosphere coupling through particle and heat fluxes and through electric fields. Specific topics to be investigated include: (1) thermal plasma distribution and flow along magnetic field lines; (2) substorm electric fields and their effects on the plasmasphere-ionosphere system; (3) correlative studies of plasmapause-associated phenomena including generation of VLF and ULF waves, particle precipitation, and ionospheric troughs; (4) artificially induced precipitation of energetic electrons; (5) theoretical studies of electrical coupling between the magnetosphere, ionosphere and lower atmosphere; (6) model studies of controlled modification of the ionosphere and plasmasphere through particle precipitation, chemical release, and F-region heating; and (7) analysis of atmospheric electric field data from polar cap regions.

SUPPORTED BY U.S. National Science Foundation, Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Atmospheric Sciences

4.0006, NEW FACILITIES FOR THE ANALYSIS OF BROADBAND VERY-LOW-FREQUENCY (VLF) RADIO SIGNALS

R.A. Helliwell, Stanford University, School of Engineering, Dept. of Electrical Engineering, *Stanford, California* 94305 (DPP78-03601)

A system for spectrum analysis of broadband very low frequency (VLF) signals will be acquired. The system will be used to analyze VLF signals collected at Siple Station, Antarctica, and Roberval, Quebec, Canada. These VLF signals are used to investigate VLF wave interactions with charged particles in the earth's magnetosphere, a subject of major interest in solar-terrestrial physics.

SUPPORTED BY U.S. National Science Foundation, Div. of Polar Programs

4.0007, RESEARCH ON WALL TURBULENCE 16651-E

R.F. Blackwelder, University of Southern California, School of Engineering, Dept. of Aerospace Engineering, *3551 University Ave., Los Angeles, California* 90007 (DA0G9124; DAAG29-79-C-0137)

To experimentally determine the unsteady sequence of events associated with the turbulence bursting phenomena in the wall region of an incompressible turbulent boundary layer. Relevance - the research relates to the dynamics of turbulent flows which dominate viscous forces on high-speed vehicles such as missiles, projectiles and helicopters.

Special emphasis will be placed upon (1) exploring the effect of the probe size on the statistics measured by different sensors, (2) studying the dynamics of the streamwise vortices in the wall region, and(3) investigating the interaction between the low-speed streaks in the wall region and the high-speed sweeps associated with the outer flow.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

4.0008, ELF/VLF PROPAGATION MEASUREMENTS

R.J. Dinger, U.S. Dept. of Defense, Navy, Naval Research Lab., *4555 Overlook Ave. S.W., Washington, District of Columbia* 20375 (DN980135)

To measure the magnetic field strength in northern Norway of the signal radiated by the Wisconsin Test Facility (WTF) transmitter in the extremely low frequency (ELF) band.

A receiver capable of demodulating the signal broadcast by the WTF will be installed near Tromso, Norway. Measurements of the magnetic field strength will be made in August 1979, in coordination with rocket sounding tests to be conducted at Thule, Greenland, by the Air Force.

SUPPORTED BY U.S. Dept. of Defense, Defense Nuclear Agency

4.0009, MOTION DRIVE SIGNALS FOR FLIGHT SIMULATORS

W.T. Harris, U.S. Dept. of Defense, Navy, Naval Training Equipment Center, Advanced Simulations Concepts Lab., *Orlando, Florida* 32813 (DN794017)

Develop several methods for calculating motion drive signals in flight simulators and relate them to motion system characteristics, flight maneuvers and training effectiveness.

Select several methods from those found in use or in the literature. Perform a preliminary selection of algorithms to be evaluated for training effectiveness by two selection experiments; the first based on system performance measures (an in-simulator study), the second, a comparison of pilot control activity (in simulator to aircraft). Then evaluate the pre-selected algorithms using transfer of training methods.

SUPPORTED BY U.S. Dept. of Defense, Naval Training Equipment Center, Advanced Simulations Concepts Lab.

4.0010, HEAD AND EYE TRACKING SYSTEM STUDY

J.J. Kulik, U.S. Dept. of Defense, Navy, Naval Training Equipment Center, Advanced Simulations Concepts Lab., *Orlando, Florida* 32813 (DN994012)

In a pilot helmet-mounted display system, head/eye tracking subsystems are essential when the display is an area of interest type. Research is needed to determine the maximum allowable delay in presentation of visual scenes after head and eye movements. Work on eye motions to determine eye speeds and type of motion is needed to enable construction of predictors for use as compensation for overall system time constant to keep within acceptable limits.

A television system will be used to produce a spot which will follow the head and eyes as they move to various positions. Variable delays ranging from 4 to 154 milliseconds will be introduced between head/eye motion and the motion of the spot on the TV screen. The maximum allowable delay will be determined using standard human factors testing techniques. An electronic system will be built and used to determine angular eye velocities. A determination will be made as to whether or not final eye fixation points can be predicted from velocity curves (e.g. From maximum eye velocity vs. final eye position). If feasible, compensation will introduced into the testing to see if

total system time constant can be reduced to within acceptable limits.

SUPPORTED BY U.S. Dept. of Defense, Naval Training Equipment Center, Advanced Simulations Concepts Lab.

4.0011, MECHANICS OF SURFACE DAMAGE IN ELASTOHYDRODYNAMIC CONTACTS 16005-E

H.S. Cheng, Northwestern University, Evanston Campus, Technological Inst., Dept. of Mechanical Engineering & Astronautical Science, *633 Clark St., Evanston, Illinois* 60201 (DA0G8912; DAAG29-78-G-0199)

To gain a basic understanding of pitting and scuffing failures in heavily loaded lubricated contacts in gears, cams, and rolling element bearings. Relevance - the subject has a high priority in the design of military vehicles and aircraft, particularly in helicopter gear box design.

Analytic and numerical determinations of subsurface stress distributions at asperities will be carried out for normal and tangential surface loads as well as for thermal conditions. Two- and three-dimensional solutions will be formed and related to pitting and scuffing.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

4.0012, THE TRAILING EDGE PRESSURE GRADIENT AS AN AIRFOIL DESIGN PARAMETER

A.I. Ormsbee, University of Illinois, Urbana Champaign Campus, School of Engineering, Dept. of Aero. & Astro. Engineering/ Theo. & Appl. Mechanics, *207 Engineering Hall, Urbana, Illinois* 61801

A study is being conducted of the use of the trailing edge pressure gradient as an input parameter in the design of low-speed airfoils. Preliminary results indicate the possibility of extending the pressure recovery region into the airfoil wake, permitting an increase in CLmax.

SUPPORTED BY University of Illinois

4.0013, PLASMA DYNAMICS

A. Bers, Massachusetts Inst. of Technology, School of Engineering, Dept. of Electrical Engineering & Computer Science, *77 Massachusetts Ave., Cambridge, Massachusetts* 02139 (ENG79-07047)

A range of analytical, computational, and experimental problems associated with plasma phenomena is being explored. Activities center on the following topics: 1. Nonlinear wave interactions - stochastic particle dynamics in waves of finite amplitude, renormalized wave-wave interaction theory, and space-time evolutionary dynamics of nonlinear interactions are being explored. 2. Nonlinear fluctuation turbulence and transport theory - the creation and decay of non wave-like fluctuations (clumps, holes, etc.) are being studied. 3. Experiments with relativistic electron beams - laser-initiated reflexing in a diode, stimulated backscattering, and Stark broadening induced by intense electric fields are topics being investigated. 4. Experiments in nonlinear wave-particle interactions - this work focuses on measurements of phase space granulation in a counter-streaming electron beam system.

This is a continuation of research previously supported under NSF grant ENG-7700340 A01.

SUPPORTED BY U.S. National Science Foundation, Div. of Engineering

4.0014, STATISTICAL IMAGE PROCESSING FOR REAL-TIME OPERATIONS

C.H. Chen, Southeastern Massachusetts University, School of Engineering, Dept. of Electrical Engineering, *North Dartmouth, Massachusetts* 02747 (DN975533; N00014-79-C-0494)

The objective of this effort is to improve the Navy's surveillance capability to detect, identify and track targets by creating and developing improved statistical and probabilistic methodology applicable to satellite technology.

Statistical and probabilistic research will be conducted in several areas, including (1) comparative evaluation of decision rules, (2) statistical feature extraction for image recognition and segmentation, (3) statistical contextual analysis of images, and (4) statistical modeling of images.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

4.0015, THE ABSORPTION OF CO2 LASER RADIATION IN DENSE PLASMAS

D.R. Bach, University of Michigan, Ann Arbor Campus, School of Engineering, Dept. of Nuclear Engineering, *Ann Arbor, Michigan* 48104 (ENG79-04820)

This research program is a study of non-linear interaction phenomena which arise when the radiation from a high intensity carbon dioxide laser beam interacts with a dense plasma. The interaction phenomena studied are closely related to the mechanisms important in the coupling of laser light with pellets of various kinds used in laser fusion experiments. Particular interest centers on experiments that involve laser penetration of a Z-pinch plasma whose density is greater than critical in order to understand both the interaction responsible for the penetration and the nature of plasma heating in the penetration region. Spatial and time dependencies of the plasma density are measured using a holographic interferometer. Thomson scattering measurements are also made in order to measure the temperature change in the plasma caused by the laser irradiation and to determine whether the penetration and heating is caused by turbulence. Separation of non-linear interactions from motion occurring on a hydrodynamic time scale is achieved with the aid of a short pulse laser system.

This is a continuation of research previously supported under NSF grant ENG-7620279.

SUPPORTED BY U.S. National Science Foundation, Directorate for Engineering & Applied Science

4.0016, ENGINEERING SPECIALIZED RESEARCH EQUIPMENT - COMBUSTION RELATED PARTICULATE AND DROPLET SIZING INSTRUMENTATION

J.A. Nicholls, University of Michigan, Ann Arbor Campus, School of Engineering, Dept. of Aerospace Engineering, *Ann Arbor, Michigan* 48104 (ENG79-11376)

An image analyzer is to be purchased. This instrument would be used by faculty members in the Department of Aerospace Engineering for a number of research projects relating to combustion particulate and droplet sizing measurements.

SUPPORTED BY U.S. National Science Foundation, Div. of Engineering

4.0017, COMMAND AND CONTROL - COLOR DISPLAY DESIGN GUIDE

M.M. Krebs, Honeywell Inc., Systems & Research Center, *2600 Ridgeway Pkwy. N.E., Minneapolis, Minnesota* 55413 (DN675169; N00014-78-M-0072)

The objective of the research is to develop a design guide, a set of principles for the design of aircraft displays which would incorporate the use of color. The integration of cockpit displays has created displays cluttered with information which increases pilot/operator workload. Color offers an additional dimension to information coding which appears to offer improved display information transfer. Color engineering technology is available for displays. However, the optimum application of color to the information to be displayed has not been established.

The technical approach will be based on a laboratory research program which will supplement available color research data. Additional inputs to the research data will be provided through working group sessions involving contractor and government representatives. The contractor will assimilate the research data, formulate a design guide, and make color coding recommendations for specific displays.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

4.0018, DETERMINATION OF DIRECTIONAL WAVE SPECTRA FROM SAR

G.E. Carlson, University of Missouri, Rolla Campus, School of Engineering, Dept. of Electrical Engineering, *Rolla, Missouri* 65401 (DN975291; N00014-79-C-0343)

The objective of this research is to determine the feasibility of determining ocean wave directional spectra from less than full SAR images. Real-time global determination of directional wave spectra from SAR data is a critical need for all naval planning and operational missions.

SEASAT SAR data will be used to test the feasibility of this concept. Discrete Fourier transforms of portions of digitized range scans will be obtained from the same wave train which will produce a smoothed one-dimensional spectrum. Pairs of range scans will then be correlated to identify wave train offset from scan to scan giving wave train direction. Combined they will produce wave direction and frequency.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

4.0019, STUDIES OF IONOSPHERIC IRREGULARITIES AND PLASMA INSTABILITIES IN THE MAGNETOSPHERE

R.N. Sudan, Cornell University, Ithaca Campus, Lab. of Plasma Studies, *159 Sapsucker Woods Rd., Ithaca, New York* 14850 (DN975322; N00014-79-C-0308)

The Navy needs quantitative information on the active state of the ionosphere and magnetosphere for radio communication applications and uses. In particular, density irregularities resulting from turbulence in the ionosphere and in the aurora will be studied. The dynamics of triggered Whistler emissions will also be studied.

Irregularities in the ionosphere and the aurora resulting from nonlinear interactions will be modeled in terms of a two-dimensional strong turbulence theory whose basis is the 'direct interaction approximation'. Analytical and numerical work on triggered Whistler emissions will be pursued in collaboration with Professor J. Denavit.

4.0020, TIES MODULAR PACKAGING STUDY

E. Grove, General Electric Co., A/C Equipment Division, *French Rd., Utica, New York* 13502 (DN981044; N62269-79-C-0007)

To establish a comprehensive modular packaging approach suitable for multisystem/multiplatform application of the TIES architecture. This contract supports work unit ZC910, Agency Accession No. DN681082.

Review present packaging techniques, develop new concepts, evaluate feasibility, and recommend and define a packaging scheme to facilitate the TIES architectural concept of programmable modules to configure future naval aircraft to differing mission requirements. Emphasis will be on the geometrically distributed nature of the TIES architecture, particularly the frequency conversion subsystem.

4.0021, ACOUSTIC EMISSION MONITORING OF FATIGUE CRACKING IN FULL-SCALE AIRCRAFT

Unknown, Grumman Aerospace Corp., *S. Oyster Bay Rd., Bethpage, New York* 11714 (DN890168; N00019-79-C-0218)

Investigate the feasibility of acoustic emission monitoring for real-time detection and location of fatigue crack initiation and growth in full-scale aircraft structure.

Acoustic emission monitoring systems, combining noise discrimination and frequency analysis concepts, will be used to detect and locate fatigue cracking in a high extraneous noise environment of a full-scale aircraft fatigue test.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Air Systems Command

4.0022, AIR CYCLE COMPRESSOR-EXPANDER

R. Smolinski, Ecton Corp., *5683 Webster St., Dayton, Ohio* 45414 (DA0P3645; DAAK70 79 C 0042)

Develop an air cycle (reversed Brayton cycle) compressor-expander with a coefficient-of-performance (COP) of one (1).

Conduct an exploratory development program using the rotary vane, positive displacement air cycle compressor-expander concept with special attention to reducing internal heat transfer from the compressor to the expander, reducing blade flexing and friction at rotor plates and end plates and increasing volumetric efficiency.

SUPPORTED BY U.S. Dept. of Defense, Army, Mobility Equipment Research & Development Command

4.0023, RADAR GROUND CLUTTER ANALYSIS AND SIMULATION

J. Haynes, U.S. Dept. of Defense, Air Force, Avionics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF098980)

To obtain statistical information concerning ground clutter return from varied terrain types and depression angles, to update the latest IITRI clutter model and incorporate this information into a radar simulation program. This will culminate in the development of an IH capability of simulating existing and proposed radar systems on our computer and testing the response of these systems to different types of accurately simulated ground clutter so that the optimum system parameters can be chosen.

To take the computer tapes containing the ground clutter return and statistically analyze them on the ASD computer system. Use this information to update the clutter model and develop a data file of clutter maps for evaluating system performance using a radar simulation program developed by IITRI for determining probability of detection in a dynamic clutter background. This study will include the generation of histograms of radar crosssection per unit area vs. number of samples, for the various terrain types and depression angles as well as the mean and standard deviation. These statistics will be done for the various clutter models, e.g., Rayleigh and log-normal to determine their validity.

4.0024, ENERGY CONVERSION - EROSION STUDY IN TURBOMACHINERY

W. Tabakoff, University of Cincinnati, School of Engineering, Dept. of Aerospace Engineering, *101 Baldwin Hall, Cincinnati, Ohio* 45221 (DN875756; N00014-78-C-0590)

The objective of this project is to investigate the basic phenomena of erosion in association with solid particles and gas flows with possible application to turbomachinery parts which are exposed to particulate environments. The effort is experimental and theoretical in nature and will contribute to an increased understanding of the effects on performance of erosion phenomena as well as on engine life relative to naval and marine power plants and fixed installations.

Study will be made of the effects of particle size on erosion, effects of true impact angles of particles, and aerodynamic effects of temperature on erosion of alloys and development of a fluid mechanics approach to alleviate erosion. The final goal will be to develop a quantitative model to predict erosion in future advanced turbomachinery operating in particulate environments.

4.0025, WEAPONRY - TURBULENT BOUNDARY LAYER SEPARATION IN ADVERSE PRESSURE GRADIENTS

R.L. Simpson, Southern Methodist University, School of Engineering & Applied Sciences, Dept. of Civil & Mechanical Engineering, *Hillcrest & University, Dallas, Texas* 75222 (DN975360; N00014-79-C-0277)

The objective of this study is to improve current knowledge of the structure of turbulence for separated and separating boundary layers in adverse pressure gradients. Such information

is needed for better design of diffusers and blade passage in aircraft turbojet engines, and ultimately should lead to improved propulsion systems for naval weaponry applications.

Experiments will be run on a flat plate in a wind tunnel test section with a two-dimensional mean flow. The turbulent boundary layer is established on the plate with the aid of a leading edge trip, and an adverse pressure gradient typical of an airfoil in a cascade is produced by contouring the upper wall of the test section. Measurements will be made in three dimensions, both upstream and downstream of separation, using hot wire anemometry in regions without backflow, and directionally sensitive laser velocimetry in other regions. The data will be analyzed and correlated, and the implications of the results on modeling of separated turbulent flows will be considered.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

4.0026, COMPOSITE ANALYSIS

G.F. Carey, University of Texas, Austin Campus, School of Engineering, Dept. of Aerospace Engineering & Engineering Mechanics, *200 W. 21st, Austin, Texas* 78712

A Monte Carlo method is utilized to simulate a class of 'non-uniform' composites and a statistical technique applied in conjunction with finite element analysis of variational boundary value problems which are posed on the sample sub-domains. The procedure has been developed as an approach for determining estimates of the macroscopic material properties of fabricated composites. Some aspects of this continuing research have been presented at a meeting of the Engineering Mechanics Division of the ASCE in May and at the recent (November 1977) meeting of the Society of Engineering Science at Lehigh. The underlying theory is the subject of a proposal submitted to the Engineering Mechanics Section of NSF and will be undertaken collaboratively with Julian Pop of the Department of Aerospace Engineering and Engineering Mechanics .

4.0027, ENGINEERING ANALYSIS OF ATTITUDE BEHAVIOR OF SPACE PROBES AND RIGID BODIES IN GENERAL

V. Szebehely, University of Texas, Austin Campus, School of Engineering, Dept. of Aerospace Engineering, *200 W. 21st, Austin, Texas* 78712

DESCRIPTION: Numerical and analytical methods are used to investigate the behavior of space probes as influenced by various perturbing effects, such as laser beams, nearby explosions, other gravitational effects, effects of rocket plumes, etc. The implication to the Texas economy is that several satellites which are photographing the Texas background regarding the growth of vegetation require high degree altitude stability in order to obtain precise photographic information. To maintain the proper orientation of these vehicles is a major engineering problem and this project tries to alleviate and solve the very same problem.

SUPPORTED BY University of Texas

4.0028, NAVY ENVIRONMENT - BALLOON COMMAND-CONTROL

P.R. William, Utah Higher Education System, Utah State University, Center for Research in Aeronomy, *Main Bldg., Office 104, Logan, Utah* 84321 (DN775171; N00014-77-C-0108)

This research effort has as its goal the development of a lightweight, inexpensive, expendable scientific balloon command-control-tracking system that can be used by Navy researchers who wish to fly small expendable experiments to high altitudes without the requirement for payload recovery. This system will allow much flexibility combined with strict compliance with flight safety requirements imposed by the Federal Aviation Administration.

The contractor has developed a lightweight, expendable command receiver for balloon control. He has added a transmitter and power supply to the system, making the control unit independent of the primary scientific equipment. This combination makes possible fixing the balloon's position in slant range and azimuth. The contractor will now add an altitude read-out for precise location. The system will be field-tested.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

4.0029, MECHANISMS OF RARE-GAS HALIDE LASERS

W. Koechner, Science Applications Inc., *1911 N. Fort Myer Dr., Suite 1200, Arlington, Virginia* 22209 (DN880097; N00173-78-C-0414)

To investigate the mechanisms occurring in rare gas laser plasmas and to determine the feasibility of generating efficient lasers in this media.

The contractor will develop a kinetics package which describes the atomic, ionic and neutral species reactions in electon-beam sustained rare-gas halide lasers. Diagnostic requirements designed to test the accuracy of the kinetics package will be carried out.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Research Lab.

4.0030, AN ANALYSIS OF THE THERMAL CONDUCTANCE OF DISSIMILAR METAL CONTACTS

L.S. Fletcher, University of Virginia, School of Engineering & Applied Science, Dept. of Mechanical & Aerospace Engineering, *Garrett Hall, Charlottesville, Virginia* 22903 (ENG78-24684)

The objective of this research is to investigate experimentally and theoretically the conduction heat transfer characteristics of metallic junctions composed of dissimilar metal junctions. Additionally, the dependence of the thermal contact conductance magnitude upon the direction of heat flow through the metallic contact (a phenomenon known as thermal rectification or directional bias) is evaluated. Supplementary goals for the research program include the generation of a substantial base of experimental contact conductance data, the development of a correlation to predict conductance values suitable for engineering applications, and the experimental determination of the effects of various parameters upon the thermal contact conductance and the thermal rectification at dissimilar metal interfaces.

5.0001, STUDIES OF NATURALLY-OCCURRING ELF AND VLF RADIOWAVES AND ASSOCIATED ULF AND PARTICLE PRECIPITATION PULSATIONS

R.R. Heacock, University of Alaska, Fairbanks Campus, Geophysical Inst., *Fairbanks, Alaska* 99701 (ATM7819963)

There are still many aspects of particle precipitation into the auroral ionosphere that are not well understood. A principal goal of this project is to gain additional insight into these processes by focusing attention on precipitation pulsations that are associated with special events such as storm sudden commencement impulses, substorm break-up impulses, events of quasi-sinusoidal character, events for which the ELF/VLF noise amplitudes are modulated at ULF frequencies less than 1 Hz, in correlation with ULF magnetic field pulsations.

This project is one of many International Magnetosphere Study (IMS) related programs. Much of the effort also involves cooperation with investigators who are taking data on IMS satellites.

This grant continues study of the relationships between naturally occurring radio waves and auroral particle precipitation. More specifically the Carib-Peak ELF-VLF and riometer site will be maintained and operated, as will the associated data recording facility at Poker Flat Research Range. College and Fort Yukon riometer data will continue to be recorded on magnetic tape. Macquarie Island ELF data will be analyzed together with Carib ELF data for conjugate characteristics. Carib ELF data will continue to be supplied to IMS satellite experimenters as re-

quired for satellite-ground comparisons. Riometer pulsation data will be analyzed together with magnetic field pulsations, ELF data, and DMSP satellite electron precipitation data in efforts to understand the roles of pulsations and ELF in producing auroral particle precipitation.

5.0002, CONTINUATION OF THE OPERATION OF MERIDIAN SCANNING PHOTOMETERS IN ALASKA DURING THE INTERNATIONAL MAGNETOSPHERIC STUDY

G.J. Romick, University of Alaska, Fairbanks Campus, Geophysical Inst., *Fairbanks, Alaska* 99701 (ATM78-25249)

Meridian scanning photometers provide a ground-based technique for determining the particle precipitation characteristics associated with various magnetospheric regions. Thus, it is important during the International Magnetospheric Study (IMS) to operate systematically a number of these systems dispersed along a geomagnetic meridian to provide a space-time mapping of the magnetospheric activity. In addition, these observations provide a temporal link between periodic satellite or rocket observations.

This grant continues operation of the meridian scanning photometers at Poker Flat Research Rocket Range on a routine schedule and at Ft. Yukon, Alaska, on a reduced selected-day schedule, along the 57 degree east geomagnetic meridian, through the IMS until March 31, 1980.

The 4278A N2 ion, 6300A and 5577A OI and 4861A H emissions are monitored in a two-second horizon-to-horizon scan period with a filter tilting mode of operation also available when the ration of auroral to background intensity is low. Digital electronics and computer-formatted magnetic tape recordings are employed. In addition, stellar observations will be performed to determine the degree of cloudiness and an absolute intensity calibration will be made on each data tape.

Lists of available data will be sent to the World Data Center for distribution to interested scientists. Detailed photometric data will be available through direct contact between investigators.

5.0003, IMAGE PROCESSING

R.M. Batson, U.S. Dept. of the Interior, Geological Survey, Geologic Div., Branch of Astrogeologic Studies, *2255 N. Gemini Dr., Flagstaff, Arizona* 86001 (9580-00991)

The Image Processing Facility will continue to provide custom processing of LANDSAT and planetary spacecraft pictures, and digital arrays of spatial geologic, geophysical, and geochemical data to support investigations of the Geologic Division.

Research will continue in the development of new techniques for the manipulation of spatial data. Specifically the following investigations are under way: 1. Derivation of topographic data by processes involving computation of ratios between bands of multispectral images. 2. Continued development of methods of correlating and displaying geophysical, geochemical, topographic and other non-image data. 3. Development of new multispectral clustering methods for image classification. 4. Development of digitally encoded catalogs of geologic features on the planets. 5. Development of techniques of using line digitizing equipment for editing and revising raster formatted data. 6. Continued development of techniques for making maps and mosaics, both in black and white and in color, of digital television images from spacecraft.

5.0004, PG-POLAR ICE INVENTORY

H. Masursky, U.S. Dept. of the Interior, Geological Survey, Geologic Div., *2255 N. Gemini Dr., Flagstaff, Arizona* 86001 (9580-02361)

The history, mobility, and storage of water and other atmospheric volatiles on Mars has become a major area of scientific controversy, particularly since the start of the Viking missions. The history of the atmosphere, the total planetary volatile inventory, the age and formation of ubiquitous large and small channels, a host of glacial phenomena observed in Orbiter images all revolve on the basic issues of how much and when water evolved from the interior as well as where it is now stored.

Various hypotheses have been proposed concerning the fate of Martian volatiles. The only sinks which can be examined directly are those at the poles where we now have excellent stereo coverage. Stereo data on slopes and thicknesses will be combined with other geologic data to estimate the volatile inventory. These estimates will strongly influence future hypotheses. In addition, by counting and studying the morphology of craters on the ice, layered deposits, and adjacent polar terrain, it may be possible to evaluate the rate of formation and destruction of these materials. The hypotheses concerning climatic history and the possible presence of life on Mars are strongly dependent on the availability of water at present and in the past.

5.0005, EOLIAN FEATURES OF THE MARTIAN POLAR REGION

J.F. McCauley, U.S. Dept. of the Interior, Geological Survey, Geologic Div., *2255 N. Gemini Dr., Flagstaff, Arizona* 86001 (9580-02381)

Viking Orbiter pictures indicate complex relationships among the various ice facies of the north polar cap, the large-scale, maturely developed dunes of the circumpolar sand seas, the layered terrain, and numerous wind erosion patterns superposed on these depositional features. We plan a detailed regional photogeologic analysis of these relationships, using our data bank of some 15,000 ground, aerial and satellite pictures of terrestrial eolian features for interpretive background. A main objective is to map the distribution and trends of the wind-formed terrains in the polar region of Mars in order to show their inferred evolution with time and relations to source materials and surface transportation regimes. Systematic measurements will be made of the major eolian landform types for statistical comparison with terrestrial features. Results of the photogeologic analysis will be applied to interpretations of the surface geologic processes and climatic history of Mars.

5.0006, GROUND-WATER HYDROLOGY OF THE COCONINO AQUIFER IN SOUTHERN APACHE CO., ARIZONA--A MATHEMATICAL ANALYSIS

P.P. Ross, U.S. Dept. of the Interior, Geological Survey, Water Resources Div., *Flagstaff, Arizona* (AZ 78-046)

Coconino aquifer will be source of water for large ground-water withdrawals in near future. Coronado generating plant and possible construction of a second generating plant will require additional water. Also, more water will be needed to support construction and maintenance personnel and satellite industries. Pumpage may increase by 50,000 AF within the next few years. Effects of project pumpage are unknown because the ground water flow system is poorly defined in part of the area.

The principal objectives are: 1. to provide a preliminary estimate of the average recharge and discharge values and to define the aquifer characteristics of that part of the Coconino aquifer that is within southern Apache County, and 2. to determine the potential effects of the projected ground-water withdrawals.

Potentiometric surface, aquifer thickness, water-level decline and aquifer characteristic data at selected points are available. Additional data required include estimates of recharge and discharge. Recharge will be estimated by a flow net analysis and discharge will be estimated on the basis of available springflow,
